Under Alternative 3, visitors would likely be drawn to the action area on or near the approximately 60 days per year on which hunt-related trips would be expected to occur, potentially creating a minor increase in the level of business activity for nearby tourist-related businesses, compared to the No-action Alternative (under which no visitors would come to the area to observe whale hunts). The number of whale hunts portrayed in the media would also likely increase compared to the No-action Alternative, possibly increasing public interest in the Makah Reservation as a cultural tourism destination (or, conversely, causing some individuals to avoid the action area because of negative publicity). The increased business activity would likely be short-term (lasting only during the days immediately surrounding hunt-related activities), as visitors would come to observe the hunt and to participate in harvest-related celebrations. Hunting would be allowed from December 1 through May 31, but would most likely occur during April and May. Potential inclement weather during April and

May could deter visitors from coming to observe a whale hunt or participate in harvest-related ceremonies.

It is uncertain whether a hunt would result in a long-term increase in tourism. Publicity about the whale hunt could generate interest in the Makah Reservation as a cultural tourism destination, while some individuals might not visit the area because of negative publicity about the whale hunt.

4.6.3.3.2 Household Use of Whale Products

Compared to the No-action Alternative (under which no whales could be harvested and the Tribe would have access only to drift whales or whales incidentally caught in fishing gear), up to five whales annually could be harvested under Alternative 3, with an average annual harvest of four whales allowed. In contrast to Alternative 2, however, whales struck and lost would be counted toward the annual mortality limit for PCFG whales, potentially reducing the total number of whales that could be harvested in some years. Under some scenarios, it is possible that hunting activities for a given year could be curtailed before any whales are successfully harvested (Subsection 4.1.3, Alternative 3). Compared to Alternative 2, therefore, it is less likely that the Tribe would be able to harvest an average of four whales per year under Alternative 3. Alternative 3 could thus have a smaller increase (relative to the No-action Alternative) in the amount of whale products available for household consumption, and manufacturing and selling of traditional handicrafts than would Alternative 2. The potential for replacement of foods that Makah families would otherwise have to purchase and increased income for households that participate in the making and selling of traditional handicrafts would likewise be smaller than under Alternative 2, although greater than under the No-action Alternative.

4.6.3.3.3 Whale-watching Industry

Compared to the No-action Alternative (under which no whales would be struck, exposed to harpoon attempts, or approached by hunters), under Alternative 3, up to 6 whales may be struck or killed annually, 36 exposed to unsuccessful harpoon attempts, and 353 approached. Although these estimates are similar to those for Alternative 2 (under which up to 7 whales may be struck annually, 42 exposed to unsuccessful harpoon attempts, and 353 approached), the actual numbers of whales killed, struck, exposed to harpoon attempts, or approached by hunters each year under Alternative 3 could be substantially smaller. As explained above in the analysis of household use of whale products, the mortality limit for PCFG whales under Alternative 3 could, in some years, result in the curtailment of the hunt before the harvest limit is attained. Therefore, the potential for a change in revenues or employment associated with whale watching, compared to the No-action Alternative, could be somewhat lower than the potential described for Alternative 2.

As described in Subsection 4.6.2.3, Whale-watching Industry, there is no information to suggest that individuals would avoid whale-watching tours if a Makah hunt is authorized, and it is unlikely that Makah hunting activities would overlap geographically with whale-watching tours. It is also unlikely that a reduction in the number of gray whales (which are not typically targeted by whale-watching operators) would change public interest in whale-watching tours, nor is it likely that gray whales would respond to a Makah tribal hunt by avoiding whale-watching vessels. As described in Subsection 4.5, Other Wildlife, it is likely that any effects of a hunt on other marine mammals, which might be a target of whale-watching operators, would be localized and temporary. To the extent such an effect might occur under Alternative 3, it is not possible to estimate the amount of decrease that might occur in revenues or employment associated with whale watching. Current revenues of whale-watching operators are unknown, and there is no information available or that could be obtained that would allow an estimation of how much revenues might decrease if ENP gray whale behavior were altered by a Makah hunt.

4.6.3.3.4 Shipping and Ocean Sport/Commercial Fishing

Compared to the No-action Alternative (under which there would be no whale hunts and no activation of the MEZ), activation of the MEZ during hunting on approximately 43 days under Alternative 3 would lead to an increased potential for restrictions on the movement of commercial shipping traffic and sport and commercial fishing. Hunting would occur primarily in April and May.

Compared to Alternative 2, the additional days of hunting (43 days under Alternative 3 versus 33 days under Alternative 2 of estimated suitable hunting conditions) would result in more instances of the MEZ being activated. This would increase the potential for whale hunting to interfere with commercial shipping or sport and commercial fishing operations beyond the potential under Alternative 2. However, as under Alternative 2, the small size of the MEZ and limited duration of activation would likely result in a negligible potential for disruption of vessel movement or fishing operations. The potential for hunt-related activities to interfere with commercial shipping traffic would be further minimized because most, if not all, hunting would likely occur within the Coast Guard RNA, which lies almost entirely within the OCNMS area to be avoided. Also, whale hunting under Alternative 3 would take place outside of the period when most sport fishing for salmon occurs in the action area. Consequently, only minor economic impacts to commercial shipping or sport and commercial fisheries would be expected as a result of implementing Alternative 3.

4.6.3.3.5 Management and Law Enforcement

Under Alternative 3, hunt-related trips would be likely to occur on approximately 60 days from December 1 through May 31 but primarily during April and May. Based on the expectation that

scouting expeditions would also be prepared to hunt if whales were found, it is assumed for this analysis that management and law enforcement resources could also be needed on approximately 60 days with hunt-related trips each year. Therefore, under Alternative 3, costs would be incurred for NMFS and Makah observers during 60 days, resulting in an increase in costs (relative to the No-action Alternative) and the same costs estimated under Alternative 2. Costs associated with photo-identification studies under Alternative 3 would be the same as under Alternative 2. It is uncertain whether the existing photo-identification study would continue to be funded under the No-action Alternative. If not, then its continuation under Alternative 3 could represent an increased cost beyond the No-action Alternative. Daily costs for enforcement could be less under Alternative 3 than the other action alternatives because hunting would take place farther off shore (Makah hunters would be prohibited from making an initial strike on a gray whale within 5 miles (8 km) of shore). Restricting hunts to offshore areas might result in a decreased need for law enforcement response, compared to the other action alternatives, because of the range limitations of some vessels (e.g., jet skis) used by protesters. If fewer people are able to participate in protests near vessels engaged in hunting, there may be fewer situations that result in the issuance of citations for negligent vessel operations, MMPA take violations, or violations of the MEZ. However, many law enforcement elements would still be deployed to monitor the hunt and the vessels transiting to and from the hunt area, and to prepare for any land-based protests. Therefore, law enforcement costs under Alternative 3 would be higher than under the No-action Alternative and would likely be the same or less than those estimated under Alternative 2.

4.6.3.4 Alternative 4, Summer/Fall Hunt

Under Alternative 4, the hunting season would extend from June 1 through November 30 instead of December through May. The maximum number of whales struck or harvested under current conditions would be limited to one ENP male whale every other year. Based on the expectation that locating and striking a known ENP male would take no more than 7 days (Subsection 4.1.4, Alternative 4), hunt-related trips under Alternative 4 would be likely to occur on approximately 7 days every other year. It is assumed for this analysis that, on average, approximately 3 whales would be exposed to harpoon attempts and 29 would be approached annually (Table 4-8). Based on the above, Alternative 4 would have a lower potential than Alternative 2 to result in changes in revenue, employment, and/or economic value, relative to the No-action Alternative, associated with (1) tourist-related business activity, (2) household consumption and manufacture and sale of traditional handicrafts, (3) the whale-watching industry, (4) commercial shipping, sport/commercial fishing, and (5) hunt-related management and law enforcement.

4.6.3.4.1 Tourism

Under Alternative 4, visitors would likely be drawn to the action area on or near the approximately 7 days every other year on which hunt-related trips would be expected to occur, potentially creating a minor increase in the level of business activity for nearby tourist-related businesses, compared to the No-action Alternative (under which no visitors would come to the action area to observe whale hunts). The number of whale hunts portrayed in the media would also likely increase compared to the No-action Alternative, possibly increasing public interest in the Makah Reservation as a cultural tourism destination (or, conversely, causing some individuals to avoid the area). The increased business activity would likely be short-term (lasting only during the period immediately surrounding hunt-related activities), as visitors would come to observe the hunt and to participate in harvest-related celebrations.

Compared to Alternative 2, the reduced number of days with hunt-related trips (3.5 on average versus 60) would probably result in a smaller increase (relative to the No-action Alternative) in the total number of visitors coming to the Makah Reservation to observe a whale hunt and/or participate in activities associated with the hunt, such as harvest-related celebrations. Conversely, visitation on days with hunt-related activities may be higher than under Alternative 2 because hunts would likely occur during the summer when visitation by tourists to the Olympic Peninsula is comparatively higher than during April and May (when most hunting would likely occur under Alternative 2). Increased visitation would be expected to increase business activity for tourist-related enterprises in and around the action area. The overall increase would, however, likely be smaller than under Alternative 2 because increased visitation would occur on fewer days.

4.6.3.4.2 Household Use of Whale Products

Under Alternative 4, the amount of whale products available for household consumption, and manufacturing and selling of traditional handicrafts would increase relative to the No-action Alternative (under which no whales could be harvested and the Tribe would have access only to drift whales or whales incidentally caught in fishing gear). The increased availability of whale products would have the potential to replace foods that Makah families would otherwise have to purchase and result in increased income for households that participate in the making and selling of traditional handicrafts. The increase would come from whales the Tribe was actually able to harvest, which would be no more than one whale annually. It is possible, however, that no whales could be harvested in some additional years if tribal hunters are unable to locate and strike a known ENP male or if a whale is struck and lost (in which case the hunt would be ended for the year).

Compared to Alternative 2, therefore, Alternative 4 would have a smaller increase (relative to the No-action Alternative) in the amount of whale products available for household consumption, and

manufacturing and selling of traditional handicrafts. The potential for replacement of foods that Makah families would otherwise have to purchase and increased income for households that participate in the making and selling of traditional handicrafts would likewise be smaller than Alternative 2, although greater than under the No-action Alternative.

4.6.3.4.3 Whale-watching Industry

Compared to the No-action Alternative (under which no hunts would occur and no whales would be struck, exposed to harpoon attempts, or approached by hunters), Alternative 4 would result in an increased potential for effects on whale-watching revenues or employment. The increase would, however, be smaller than under any of the other action alternatives because Alternative 4 would be expected to result in the fewest whales killed (1 every other year), struck (1 every other year), exposed to harpoon attempts (3, on average, annually), or approached (29, on average, annually). For the reasons provided in Subsection 4.6.2.3, Whale-watching Industry, it is unlikely that whale hunting under Alternative 4 would have more than a negligible effect on whale-watching revenues or employment within or outside the action area through any of the scenarios described. In addition, to the extent that any such effects might occur, it is not possible to estimate the amount of decrease that might occur in revenues or employment associated with whale watching.

4.6.3.4.4 Shipping and Ocean Sport/Commercial Fishing

Compared to the No-action Alternative (under which there would be no whale hunts and no activation of the MEZ), activation of the MEZ on approximately 7 days during a whale hunt every other year under Alternative 4 would lead to an increased potential for restricting operations of commercial shipping vessels and sport and commercial fishing. Hunting would occur primarily during the summer months.

Compared to Alternative 2, the reduced number days with whale hunts (3.5 on average versus 33) would result in fewer instances of the MEZ being activated. Alternative 4 would, therefore, result in a smaller increase (relative to the No-action Alternative) in the potential for whale hunting to interfere with commercial shipping or commercial fishing operations than would Alternative 2. As noted above, the number of days when whale hunts result in MEZ activation could be substantially fewer in years when a whale is struck and lost and the hunt is curtailed.

Because hunting would be allowed during the summer, Alternative 4 would result in a greater potential, compared to any of the other action alternatives, for a given instance of MEZ activation to interfere with sport salmon fishing (which occurs during summer and early fall). Alternative 4 could, therefore, have a slightly greater potential than the other action alternatives to affect sport salmon fishing. As

under Alternative 2, however, only minor economic impacts to commercial shipping or sport and commercial fisheries would be expected as a result of implementing Alternative 4.

4.6.3.4.5 Management and Law Enforcement

Under Alternative 4, hunting would be likely to occur on approximately 7 days every other year during the summer, during which costs would be incurred for management and law enforcement agencies. Observer costs would be an increase relative to the No-action Alternative but less than the 33 days likely under Alternative 2 or the 60 days under Alternative 3. Estimated costs for a NMFS observer for 7 days could be as high as $1,841 (NMFS 2014a) (Table 4-16). Costs associated with photo-identification studies under Alternative 4 would be the same as under Alternatives 2 and 3. It is uncertain whether the existing photo-identification study would continue to be funded under the No-action Alternative. If not, then its continuation under Alternative 4 would represent an increased cost beyond current conditions.

Compared to the No-action Alternative, law enforcement costs would increase by the number of days (7) when hunt-related activities (e.g., hunting, protests, and ceremonies) occurred that required a law enforcement presence. Estimated costs for all non-tribal agencies could be as high as $641,690 over the course of 7 days, with the bulk of costs associated with United States Coast Guard aircraft and vessels (NMFS 2014a) (Table 4-16). Therefore, law enforcement costs under Alternative 4 would be higher than under the No-action Alternative but would likely be lower than those estimated under Alternatives 2 and 3, which have more days of hunt-related trips.

4.6.3.5 Alternative 5, Split-season Hunt

Under Alternative 5, the hunting season would be 3 weeks in December and 3 weeks in May, in contrast to the 6-month-long hunting seasons under the other action alternatives. In addition, the landing of a single PCFG whale, or the striking and losing of a single whale, would end the hunt for any given year. A maximum of five whales could be struck or killed per year. Approximately 30 whales would be exposed to harpoon attempts and 122 would be approached annually. Hunt-related trips would likely occur on approximately 22 days in December and May but primarily during May. If tribal members hunted on every suitable hunting day during the December and May seasons, there would be approximately 15 days with actual hunting each year (Subsection 4.1.5.1, Potential Timing of a Hunt and Number of Hunting Days [Alternative 5]).

Compared to the No-action Alternative, under which there would be no hunting, Alternative 5 would be likely to result in (1) minor short-term increases in tourism on or near the approximately 22 days per year when hunt-related trips would be expected to occur, (2) an increase of up to one whale annually available for household use by Makah tribal members, (3) negligible changes in whale-watching

revenues because of reduced numbers of gray whales or changes in whale behavior as a result of interactions between hunters with whales, (4) minor increases in the potential for interference with shipping and sport/commercial fishing vessels, and (5) an increase in expenditures for management and law enforcement.

4.6.3.5.1 Tourism

Under Alternative 5, visitors would likely be drawn to the action area on or near the approximately 22 days on which hunt-related trips would be expected to occur, potentially creating a minor increase in the level of business activity for nearby tourist-related businesses, compared to the No-action Alternative (under which no visitors would come to the action area to observe whale hunts). The number of whale hunts portrayed in the media would also likely increase compared to the No-action Alternative, possibly increasing public interest in the Makah Reservation as a cultural tourism destination (or, conversely, causing some individuals to avoid the area because of negative publicity). The increased business activity would likely be short-term (lasting only during the days immediately surrounding hunt-related activities), as visitors would come to observe the hunt and to participate in harvest-related celebrations.

Compared to Alternative 2, the reduced number of days with hunt-related trips (22 versus 60) would probably result in a smaller increase (relative to the No-action Alternative) in the total number of visitors coming to the Makah Reservation to observe a whale hunt and/or participate in activities associated with the hunt, such as harvest-related celebrations. The number of days with hunt-related trips could decrease to as few as 0 days in years in which the hunt is on hiatus to allow the PCFG mortality limit to re-set at one whale.

4.6.3.5.2 Household Use of Whale Products

Based on the constraints imposed by the hunting season and the PCFG mortality limit, it is expected that the Tribe would harvest up to one whale per year (Subsection 4.1.5, Alternative 5). During years in which no whales are struck and lost, and no PCFG whales are killed, the maximum limit for the number of whales harvested would be the same as under Alternatives 2 and 3. Compared to the No-action Alternative (under which no whales could be harvested and the Tribe would have access only to drift whales or whales incidentally caught in fishing gear), therefore, Alternative 5 would result in an increase in the amount of whale products available for household consumption, and manufacturing and selling of traditional handicrafts. The increase would come from whales the Tribe was actually able to harvest, which would likely be zero to one whale annually. Under some scenarios, the potential increase could be as high as under Alternative 2, but the more likely increase would be similar to that expected for Alternative 4.

Compared to Alternatives 2 and 3, the lower number of whales likely to be harvested would be expected to result in fewer whale products being available for household consumption and the making and selling of traditional handicrafts. The potential replacement of foods that Makah families would otherwise have to purchase and the increase in income for households that participate in the making and selling of such articles would likewise be lower.

4.6.3.5.3 Whale-watching Industry

Compared to the No-action Alternative (under which no hunts would occur and no whales would be struck, exposed to harpoon attempts, or approached by hunters), Alternative 5 would result in an increased potential for effects on whale-watching revenues or employment. The increased potential would be a product of the number of whales struck or killed (5), exposed to harpoon attempts (30), or approached (122) per year. These values could decrease to zero in years in which the hunt is on hiatus to allow the PCFG mortality limit to reset at one whale. For the reasons provided in Subsection 4.6.2.3, Whale-watching Industry, it is unlikely that whale hunting under Alternative 5 would have more than a negligible effect on whale-watching revenues or employment within or outside the action area through any of these the scenarios described. In addition, to the extent that any such effects might occur, it is not possible to estimate the amount of decrease that might occur in revenues or employment associated with whale watching.

Compared to Alternatives 2 and 3, fewer whales could be struck or killed (5 versus 6 or 7 per year) or exposed to harpoon attempts (30 versus 36 to 42) or approaches (122 versus 353) under Alternative 5. Therefore, the potential for interactions between hunting and whale watching, or for whale hunting to affect whale behavior around whale-watching vessels, would be less than under Alternative 2 or Alternative 3.

4.6.3.5.4 Shipping and Ocean Sport/Commercial Fishing

Compared to the No-action Alternative (under which there would be no whale hunts and no activation of the MEZ), activation of the MEZ on approximately 15 days under Alternative 5 would lead to an increased potential for restrictions on the movement of commercial shipping traffic and sport and commercial fishing. Compared to Alternatives 2, 3, and 6, the reduced number of days with whale hunts (11 versus 60) would result in fewer instances of the MEZ being activated. Alternative 5 would, therefore, result in a smaller increase (relative to the No-action Alternative) in the potential for whale hunting to interfere with commercial shipping or sport and commercial fishing operations than would Alternatives 2, 3, and 6. As under Alternative 2, only minor economic impacts to commercial shipping or sport and commercial fisheries would be expected as a result of implementing Alternative 5.

Compared to Alternative 4, Alternative 5 could result in a greater increase (relative to the No-action Alternative) in the potential for whale hunting to interfere with commercial shipping or sport and commercial fishing operations. This is based on the anticipated difference in the number of days of hunting (11 versus an average of 3.5). As noted above, however, the number of days when whale hunts result in MEZ activation under Alternative 5 could decrease to 0 during years in which the hunt is on hiatus to allow the PCFG mortality limit to re-set at one whale. Because hunting would not be allowed during summer, Alternative 5 would likely result in a lower potential to affect sport salmon fishing compared to Alternative 4.

4.6.3.5.5 Management and Law Enforcement

Compared to the No-action Alternative (under which no whale-hunting or associated protests would occur), Alternative 5 could result in up to 22 days of hunt-related trips and associated commitments of observers and enforcement personnel, vehicles, and equipment. The costs for hunt observers would increase (compared the No-action Alternative) by the likely number of days of hunt-related trips (22 days) for the reasons described under Alternative 2. Estimated costs for a NMFS observer for 22 days could be as high as $5,786 (NMFS 2014a) (Table 4-16) under Alternative 5, which is intermediate between the lower costs estimated for Alternative 4 and the higher costs estimated for Alternatives 2 and 3. It is uncertain whether the existing photo-identification study would continue to be funded under the No-action Alternative. If not, then its continuation under Alternative 5 could represent an increased cost beyond the No-action Alternative.

Compared to the No-action Alternative, law enforcement costs would increase by the number of days (22) when hunt-related activities (e.g., hunting, protests, and ceremonies) occurred that required a law enforcement presence. Estimated costs for all non-tribal agencies could be as high as $2 million over the course of 22 days with hunt-related trips, with the bulk of costs associated with United States Coast Guard aircraft and vessels (NMFS 2014a) (Table 4-16). Therefore, law enforcement costs under Alternative 5 would be higher than under the No-action Alternative and Alternative 4 but would likely be lower than those estimated under Alternatives 2 and 3, which have more days of hunt-related trips.

4.6.3.6 Alternative 6, Different Limits on Strikes and PCFG, and Limited Duration of Regulations and Permits

Under Alternative 6, the waiver and implementing regulations would lapse after 10 years. Therefore, the analysis for Alternative 6 considers effects over a 10-year period.

Alternative 6 would have the same conditions as Alternative 2 regarding the hunt area, season, and methods and would, therefore, be expected to result in the same numbers of days with hunt-related trips (60) and actual hunts (33) over the course of the 10-year waiver period. Thus, the potential effects,

relative to the No-action Alternative, on tourist-related business activity under Alternative 6 would likely be the same as those under Alternative 2. For the same reason, the potential effects on commercial shipping traffic, sport and commercial fisheries, and management and law enforcement costs under Alternative 6 would likely be the same as under Alternative 2. The following paragraphs address potential effects on (1) household consumption of whale products and manufacture and sale of traditional handicrafts and (2) the whale-watching industry.

4.6.3.6.1 Household Use of Whale Products

Alternative 6 would include greater restrictions than Alternatives 2 and 3 on the maximum number of whales that could be killed per year and per 2 years, resulting in a maximum of 3.5 whales harvested per year on average over 10 years. As a result, Alternative 6 would result in an increase, compared to the No-action Alternative, in the amount of whale products available for household consumption, and manufacturing and selling of traditional handicrafts. This increase would be less than under Alternatives 2 and 3 (under which a maximum of four whales could be harvested per year on average) but greater than under Alternative 4 (under which a maximum of one whale could be harvested every other year under current conditions; refer to Table 4-7). The potential for increased income for households that participate in the making and selling of traditional handicrafts would be smaller than under Alternative 2, although greater than under the No-action Alternative.

4.6.3.6.2 Whale-watching Industry

Under Alternative 6, no more than four whales could be struck or killed per year, and no more than seven whales could be struck or killed over 2 years. Approximately 21 whales would be exposed to harpoon attempts and 353 would be approached annually. These estimates are less than or equal to those for Alternative 2 (under which up to 7 whales may be struck annually, 42 exposed to unsuccessful harpoon attempts, and 353 approached). As a result, the potential for Alternative 6 to result in a change in revenues or employment associated with whale watching, would likely be slightly lower than the potential described for Alternative 2. For the reasons provided in Subsection 4.6.2.3, Whale-watching Industry, it is unlikely that whale hunting under Alternative 6 would have more than a negligible effect on whale-watching revenues or employment within or outside the action area through any of the scenarios described. In addition, to the extent that any such effects might occur, it is not possible to estimate the amount of decrease that might occur in revenues or employment associated with whale watching.

4.6.3.7 Alternative 7, Composite Alternative – Preferred

Under Alternative 7, like Alternative 6, the waiver and implementing regulations would lapse after 10 years. Therefore, the analysis for Alternative 7 considers effects over a 10-year period.

Compared to the No-action Alternative, under which there would be no hunting, Alternative 7 would likely result in: (1) minor short-term increases in tourism on or near the approximately 37 days per year when hunt-related trips would be expected to occur (based on the 10-year span of the waiver period); (2) an increase of one to three whales annually available for household use; (3) negligible changes in whale-watching revenues, (4) minor increases in the potential for interference with shipping and sport/commercial fishing, and (5) an increase in expenditures for management and law enforcement during the average of 37 days per year with hunt-related trips (see Table 4-16 below).

Alternative 7 would have the same conditions as Alternative 2 regarding the hunt area and methods and, in winter/spring hunts, would have the same hunt season. In summer/fall hunts, the timing of the hunt would be similar to Alternative 4. Assuming the Tribe receives authorization to hunt during all five winter/spring hunt seasons over the 10-year waiver period, hunt-related trips would likely occur on an average of 37 days per year, with approximately 60 days with hunt-related trips annually in winter/spring hunts and up to 14 days with hunt-related trips annually in summer/fall hunts (Table 4-1). As a result of this alternating hunt season schedule under Alternative 7, potential impacts to tourism, commercial shipping traffic, sport and commercial fisheries, and management and law enforcement sectors are difficult to compare with Alternatives 2 through 6. Over the proposed 10-year waiver period, impacts to these sectors under Alternative 7's winter/spring hunts would occur on half the number of days estimated for Alternatives 2, 3, and 6. These hunts would also occur during the winter/spring when there would be less activity in these sectors. Impacts under Alternative 7's summer/fall hunts would occur over an estimated 70-140 days during the summer/fall over the 10-year period, which is greater than that estimated for Alternative 4 (35 days over 10 years) but less than that estimated for Alternative 5 (220 days over 10 years). It is expected that hunt-related activities would have greater impacts during the summer/fall when there is generally more traffic and tourism in the vicinity of the hunt area. For this reason, it is possible that Alternative 7 would result in greater positive impacts to these economic sectors than Alternatives 2, 3, and 6, which do not allow hunting during the summer/fall. Similarly, Alternative 7 would likely have greater impacts overall than Alternatives 4 and 5 due to the additional large number of days (300 over 10 years) that would occur as a result of the winter/spring hunts.

Implementing a low abundance threshold for the ENP stock may reduce the economic impacts to these sectors below those already analyzed under Alternative 7 without a threshold. To compare the relative impacts of Sub-alternatives 7(a), 7(b), and 7(c) on the tourism, commercial shipping, sport and recreational fishing, and enforcement sectors, we consider the relative likelihood of triggering the low-abundance threshold of each sub-alternative. Sub-alternative 7(c) carries the highest likelihood of

reducing the number of authorized hunting years and, therefore, the annual average number of days with hunt-related trips over the waiver period. Sub-alternative 7(a), on the other hand, is most likely to allow hunting to occur during all 10 years of the proposed waiver period. As such, of the three sub-alternatives, 7(c) could result in the lowest potential impact to these sectors while 7(a) could result in the greatest potential impact.

Alternative 7, resulting in a maximum of 2 whales harvested per year on average, would include greater restrictions than Alternatives 2, 3, and 6 on the maximum number of whales that could be harvested per year. As a result, Alternative 7 would result in an increase, compared to the No-action Alternative, in the amount of whale products available for household consumption and the manufacturing and selling of traditional handicrafts. This increase would be less than Alternatives 2, 3, and 6 (under which a maximum of 4, 4 and 3.5 whales may be harvested per year, respectively) but greater than Alternatives 4 and 5 (under which zero to one whale may be harvested per year under current conditions). However, if the Tribe does not receive authorization to hunt during one or more winter/spring hunting seasons, the total number of whales harvested over the waiver period could be reduced, decreasing the availability of whale products for household consumption and the manufacturing and selling of handicrafts.

Implementing a low abundance threshold for the ENP stock may reduce the availability of whale products available to the Tribe. To compare the relative impacts of Sub-alternatives 7(a), 7(b), and 7(c) on the availability of whale products, we consider the relative likelihood of triggering the low-abundance threshold of each sub-alternative. Sub-alternative 7(c) carries the highest likelihood of reducing the number of authorized hunting years and, therefore, the number of whales harvested over the waiver period. Sub-alternative 7(a), on the other hand, is most likely to allow hunting to occur during all 10 years of the proposed waiver period. As such, of the three sub-alternatives, 7(a) is likely to result in the highest availability of whale products, while 7(c) may restrict the availability of such products the most.

As noted in the Subsection 4.6.2.3, Whale-watching Industry, it is unlikely that Makah whale hunting under any of the action alternatives would have more than a negligible effect on whale watching. To the extent such an impact did occur, the amount of risk would probably depend on the number of whales that could be killed, struck, or exposed to unsuccessful harpoon attempts and approaches. Under Alternative 7, such risks would be associated with an annual average of 15 whales exposed to unsuccessful harpoon attempts, one to three whales struck, and 353 whales approached (Table 4-1). These estimates indicate that any risks under Alternative 7 would be intermediate to those of the other action alternatives, i.e., while these estimates are greater than those associated with the relatively

limited hunting allowed under Alternative 4, nearly all of these values are less than or equal to those expected under Alternatives 2, 3, 5, and 6. Although it is not possible to estimate the amount of decrease that might occur in revenues or employment associated with whale watching as a result of any action alternative, for the reasons provided in Subsection 4.6.2.3, Whale-watching Industry, it is unlikely that whale hunting under Alternative 7 and its sub-alternatives would have more than a negligible effect.

Table 4-16. Estimated costs of enforcement-related activities and resources.

Entity	Unit Cost	No-action Alternative		Alternatives 2, 3 & 6		Alternative 4		Alternative 5		Alternative 7	
		Freq.	Cost	Freq.	Cost	Freq.	Cost	Freq.	Cost	Freq.	Cost
U.S. Coast Guard	$86,068 per day	*	*	60 days	$5.2 million	7 days	$602,476	22 days	$1.9 million	37 days	$3.2 million

4.7 Environmental Justice

4.7.1 Introduction

Executive Order 12898, *Environmental Justice*, requires that federal agencies "identify and address the . . . disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations." Based on assessment of the demographic data presented in Subsection 3.7, Environmental Justice, and preliminary analysis of the type and location of effects potentially resulting from the proposed action, the potential population of concern for this environmental justice analysis consists of members of the Makah Tribe, who are a Native American population. As described in Subsection 3.7, Environmental Justice, this is a low-income, as well as a minority, population.

4.7.2 Evaluation Criteria

The EPA Office of Civil Rights and Environmental Justice developed guidance for all federal agencies conducting environmental justice analyses. This environmental justice analysis follows the EPA guidelines that offer a range of categories to indicate the presence or absence of environmental justice effects (EPA 1998; EPA 2010). This evaluation draws topically from the range of indicator categories EPA (1998) outlined. These categories correspond to effects described in Subsection 4.6, Economics, Subsection 4.8, Social Environment, and Subsection 4.10, Ceremonial and Subsistence Resources, of this EIS. The EPA environmental justice guidelines also indicate that impacts on human health should be considered in environmental justice analyses. As discussed in Subsection 4.16, Human Health, available information is insufficient to assess the potential of any of the alternatives to affect human health, either positively or negatively.

Analyses in this subsection also do not address the potential for the alternatives to affect the safety of Makah tribal members because environmental justice contemplates impacts imposed on minority and low-income populations by a federal agency. The proposed action is based on the Tribe's MMPA waiver request and the other action alternatives include variations on the restrictions identified in the Tribe's request. Risks associated with whale hunting would be undertaken voluntarily by the Tribe. The safety of hunt participants and others is addressed in Subsection 4.15, Public Safety. Authorization of a whale hunt under the action alternatives would likely result in some level of whale hunting activity by Makah tribal members, increasing the potential for hunt-related injury above the current level of injury under the No-action Alternative.

This analysis was based on a qualitative assessment of adverse effects that would result from the proposed alternatives for each of the three resource areas evaluated. An environmental justice impact would occur if these adverse effects were to have a disproportionate effect on the environmental justice population of concern. A disproportionately high and adverse effect on minority and low-income populations means an adverse effect that (1) is predominantly borne by a minority population and/or a low-income population, or (2) will be suffered by the minority population and/or low-income population and is appreciably more severe or greater in magnitude than the adverse effect that will be suffered by the non-minority population and/or non-low-income population.

For each alternative, the analysis considers potential effects related to economics, ceremonial and subsistence resources, and social environment. Economic effects would be related to tourism, which would be affected by the number of days per year with hunt-related trips, and household consumption of whales, which would be affected by the number of whales harvested (similar to the analyses in

Subsection 4.6, Economics). Effects on ceremonial and subsistence resources and the social environment would be related to whether whale hunting is denied or allowed.

4.7.3 Evaluation of Alternatives

The following subsections compare the potential for the alternatives to affect conditions in the action area as they pertain to environmental justice. For each alternative, the discussion addresses the potential economic, ceremonial and subsistence resources, social environment, and human health effects on the Makah Tribe and other low-income or minority populations.

Business activity at tourist-related enterprises in Neah Bay generates jobs and income for tribal members (Subsection 3.6.3.2.4, Contribution of Tourism to the Local Economy). As described in Subsection 4.6.2.1, Tourism, whale hunts may create short-term increases in tourist-related business activity during a whale hunt. A whale hunt may also create an opportunity over the long term for the Tribe to attract visitors to Neah Bay who are interested in observing traditional cultural activities. On the other hand, hunting could also lead to boycott attempts by whale-hunting opponents, which could reduce the number of visitors to Neah Bay. If, on balance, the absence of a whale hunt resulted in less tourism-related business activity in Neah Bay (compared to the action alternatives), a disproportionate share of the adverse economic effects would fall on the Makah Tribe.

Potential short-term increases (relative to the No-action Alternative) in business activity for tourist-related enterprises on the Makah Reservation would likely be higher under Alternatives 2, 3, 6, and 7 compared to Alternatives 4 and 5 because hunt-related trips would be expected to occur on approximately 60 days per year under Alternatives 2, 3, and 6 and an average of 37 days per year (60 days in winter/spring hunt years and up to 14 in summer/fall hunt years) under Alternative 7. Hunt-related trips would be expected to occur on approximately 22 days per year under Alternative 5 and only 7 days per year under Alternative 4. Increases in business activity on days with hunt-related activity could be higher under Alternative 4 and during the summer/fall hunt years under Alternative 7 than under the other action alternatives, however, because tourist activity is higher during those months than during April and May (when most hunting would likely occur under the other action alternatives). Regarding the Tribe's ability to attract more visitors over the longer term because of a hunt, all of the action alternatives are likely to have an equal effect, compared to the No-action Alternative.

Under the No-action Alternative, no freshly harvested whale products would be available to Makah households. The quantity of whale products available to Makah households for consumption and the making and selling of handicraft articles would be limited to drift whales or whales taken incidentally in fisheries. A disproportionate share of these adverse effects would fall upon the Makah Tribe, which

would have been the primary users of such products. Lack of such products would make largely unavailable a traditional subsistence resource for household members and the Makah community as a whole.

Based on the likely number of whales that would be successfully harvested per year (Table 4-1), the amount of edible and non-edible whale products that would become available would probably be greater under Alternatives 2 and 3 than under the other action alternatives. The likely number of whales harvested under Alternative 6 would be slightly lower (3.5 compared to 4) and, similar to Alternative 3, could be further constrained by the limit on PCFG whale mortality. The number of whales that could be harvested under Alternative 4 would be limited to one every other year under current conditions. It is possible, however, that no whales could be harvested in more years if tribal hunters are unable to locate and strike a known ENP male or if a whale is struck and lost (in which case, the hunt would be ended for the year). Based on the constraints imposed by the hunting season and the PCFG mortality limit under Alternative 5, it is expected that the Tribe would harvest up to one whale per year, although the maximum limit would be five.

Under the No-action Alternative, subsistence and cultural activities related to whale hunting (e.g., preparation, hunting, butchering, sharing, consuming, dancing, singing, and rituals) would be more limited than under the action alternatives. A disproportionate share of the adverse effects on subsistence uses, traditional knowledge and activities, spiritual connection to whale hunting, and cultural identity would fall upon the Makah Tribe. The Makah's stated need for the whale hunt is to allow the Tribe to exercise its treaty whale hunting rights to provide a traditional subsistence resource to the community and to sustain and revitalize the ceremonial, cultural, and social aspects of its whale hunting traditions. Alternatives 3, 4, 5, 6, and 7 would have the positive ceremonial and subsistence effects associated with a resumption of Makah whale hunting but would restrict whale hunting in various ways that might make these benefits lower than under Alternative 2.

Under the No-action Alternative, the benefits to the social environment (for example, community cohesion) that the Makah Tribe attributes to whale hunting would not be realized, potentially increasing social tension within the Makah Tribe. To the extent they occurred, these adverse social impacts would be borne predominantly by Makah tribal members. Other treaty tribes could view NMFS' action under the No-action Alternative as a breach of faith by the United States government in upholding treaty rights, depending on the reasons for the denial of the request. Any social tension created by this perception would predominantly be borne by Native Americans. Under any of the action alternatives, the social benefits that the Makah Tribe attributes to whale hunting would be realized; however, whale hunts would also probably exacerbate the social tensions between tribal members who do and those

who do not support the hunt. There is insufficient information to determine whether the potential social benefits to the Makah Tribe would offset the potential adverse social effects. Consequently, it is not possible to determine if the action alternatives would result in disproportionately high and adverse social effects on the Makah Tribe. Under any of the action alternatives, the Tribe's ability to engage in traditional activities such as whale hunting could be reassuring to other Native Americans.

4.7.3.1 Alternative 1, No Action

4.7.3.1.1 Economics

Under the No-action Alternative, no whale hunt would be permitted, and there would be no short-term increases in business activity as visitors come to Neah Bay to view hunt-related activities or to participate in harvest-related celebrations. In addition, there be no potential for media coverage of the whale hunt to generate interest in the Makah Reservation as a cultural tourism destination. As a result, this alternative might limit the long-term opportunities for the Makah to expand the tribal tourism sector of the reservation economy. On the other hand, under the No-action Alternative it is unlikely there would be attempts to boycott Neah Bay because of whale hunting. If, on balance, the absence of a whale hunt under the No-action Alternative resulted in less tourism-related business activity in Neah Bay (compared to under the action alternatives), a disproportionate share of these adverse effects would fall on the Makah Tribe.

With the possible exception of products from drift whales or whales incidentally caught in fisheries, there would be no potential for households to consume whale meat and blubber or use non-edible whale products for the manufacture and sale of traditional handicrafts. The potential for households to gain additional income from making and selling traditional handicrafts would not be realized. As noted in Subsection 3.7.3.3.3, Makah Tribe, Native Americans living on the Makah Reservation have substantially lower incomes and experience higher poverty rates than residents throughout Clallam County. The adverse impact of this unrealized household income would be borne predominantly by Makah households. The Makah households would principally use the whale products to provide a traditional subsistence resource to household members and the wider Makah community and to derive income from the manufacture and sale of traditional native handicrafts.

4.7.3.1.2 Ceremonial and Subsistence Resources

Under the No-action Alternative, some subsistence and cultural activities related to whale hunting (e.g., preparation, hunting, butchering, sharing, consuming, dancing, singing, and rituals) would not be expected to occur. A disproportionate share of the adverse effects on subsistence uses, traditional knowledge and activities, spiritual connection to whale hunting, and cultural identity would fall upon the Makah Tribe. The Makah's stated need for the whale hunt is to allow the Tribe to exercise treaty

whale hunting rights to provide a traditional subsistence resource to the community and to sustain and revitalize the ceremonial, cultural, and social aspects of its whale hunting traditions.

4.7.3.1.3 Social Environment

Under the No-action Alternative, the benefits to the social environment (for example, community cohesion) that the Makah Tribe attributes to whale hunting would not be realized, potentially increasing social tension within the Makah Tribe. To the extent that they would occur, these adverse social impacts would be borne predominantly by members of the Makah Tribe. Other treaty tribes could view NMFS' action under the No-action Alternative as a breach of faith by the United States government in upholding treaty rights, depending on the reasons for the denial of the request. Any social tension created by this perception would predominantly be borne by Native Americans.

4.7.3.2 Alternative 2, Tribe's Proposed Action

4.7.3.2.1 Economics

In comparison to the No-action Alternative, a whale hunt would be allowed and there could be 60 days with hunt-related trips per year, resulting in a minor increase in the level of business activities of tourist-related enterprises in and around the action area. Over the longer term, the Tribe would have opportunities to bolster the tribal tourism sector of the reservation economy, as media stories would increase public awareness of the Makah whale hunt and the Tribe's whale hunting tradition. Boycott attempts, however, could reduce any long term benefits from tourism.

Compared to the No-action Alternative, the potential for whale products to become available to Makah households for consumption and the making and selling of handicraft articles would increase (up to four whales per year on average) as a result of the resumption of Makah whale hunting. The increased potential for whale products to become available for household consumption and the making and selling of traditional handicraft articles would have a beneficial effect on Makah households.

4.7.3.2.2 Ceremonial and Subsistence Resources

In contrast to the No-action Alternative, Alternative 2 would have multiple positive ceremonial and subsistence effects on the Makah Tribe associated with a resumption of whale hunting. Alternative 2, like the other action alternatives, would be consistent with the Makah's stated need for the whale hunt, which is to allow the Tribe to exercise its treaty whale hunting rights to provide a traditional subsistence resource to the community and to sustain and revitalize the ceremonial, cultural, and social aspects of its whale hunting traditions.

4.7.3.2.3 Social Environment

In contrast to the No-action Alternative, the benefits to the social environment (for example, increased social bonding within the Makah Tribe) that the Tribe attributes to whale hunting would be realized. However, social tensions exist between tribal members who support the hunt and those who do not. Whale hunts under Alternative 2 would probably exacerbate these tensions. There is insufficient information to determine whether the potential social benefits to the Makah Tribe would offset the potential adverse social effects. Consequently, it is impossible to determine if Alternative 2 would result in disproportionately high and adverse social effects.

Alternative 2 would make it possible for the Tribe to carry on traditional whale hunting that is sanctioned by the IWC. In contrast to the No-action Alternative, allowing the Tribe to engage in traditional activities such as whale, despite their controversial nature, would likely be reassuring to other Native Americans.

4.7.3.3 Alternative 3, Offshore Hunt

4.7.3.3.1 Economics

In comparison to the No-action Alternative, there could be a minor increase, as under Alternative 2, in the level of business activities of tourist-related enterprises in and around the action area. Over the longer term, the Tribe would have opportunities to bolster the tribal tourism sector of the reservation economy, as media stories would increase public awareness of the Makah whale hunt and the Tribe's whale hunting traditions. Boycott attempts, however, could reduce any long-term benefits from tourism.

Compared to the No-action Alternative, the potential for whale products to become available to Makah households for consumption and the making and selling of handicraft articles would increase as a result of the resumption of Makah whale hunting. The increased potential for whale products to become available for household consumption and the making and selling of traditional handicraft articles would have a beneficial effect on Makah households.

Compared to Alternative 2, Alternative 3 would be expected to result in the same number of days with hunt-related trips (60) on which there could be increased business activity caused by an influx of visitors. In contrast to Alternative 2, it is possible that hunting activities in some years could be curtailed before any whales are successfully harvested. Compared to Alternative 2, therefore, it is less likely that the Tribe would be able to harvest an average of four whales per year under Alternative 3. Alternative 3 could, thus, have a smaller increase (relative to the No-action Alternative) in the amount of whale products available for household consumption and manufacturing and selling of traditional handicrafts than would Alternative 2.

4.7.3.3.2 Ceremonial and Subsistence Resources

In contrast to the No-action Alternative, Alternative 3 would have multiple positive ceremonial and subsistence effects on the Makah Tribe associated with a resumption of whale hunting. Alternative 3, like the other action alternatives, would be consistent with the Makah's stated need for the whale hunt, which is to allow the Tribe to exercise its treaty whale hunting rights to provide a traditional subsistence resource to the community and to sustain and revitalize the ceremonial, cultural, and social aspects of its whale hunting traditions.

Compared to Alternative 2, limits on PCFG whale mortality under Alternative 3 could reduce the total number of whales harvested in some years. Under some scenarios, it is possible that hunting activities for a given year could be curtailed before any whales are successfully harvested. In addition, Makah hunters would be prohibited from making an initial strike on a gray whale within 5 miles (8 km) of shore. Consequently, the positive ceremonial and subsistence effects that the Makah would experience as a result of a resumption of whale hunting could be smaller under Alternative 3 than under Alternative 2. Alternative 3, like the other action alternatives, would be consistent with the Makah's stated need for the whale hunt.

4.7.3.3.3 Social Environment

In contrast to the No-action Alternative, the benefits to the social environment (for example, increased social bonding within the Makah Tribe) that the Tribe attributes to whale hunting would be realized. However, social tensions exist between tribal members who support the hunt and those who do not. Whale hunts under Alternative 3 would probably exacerbate these tensions. There is insufficient information to determine whether the potential social benefits to the Makah Tribe would offset the potential adverse social effects. Consequently, it is impossible to determine if Alternative 3 would result in disproportionately high and adverse social effects.

Alternative 3 would make it possible for the Tribe to carry on traditional whale hunting that is sanctioned by the IWC. In contrast to the No-action Alternative, resumption of traditional activities such as whale hunting would likely be reassuring to other Native Americans.

The amount of social benefit the Makah Tribe experiences under Alternative 3 would probably be the same as under Alternative 2.

4.7.3.4 Alternative 4, Summer/Fall Hunt

4.7.3.4.1 Economics

In comparison to the No-action Alternative, there could be a minor increase, as under Alternative 2, in the level of business activities of tourist-related enterprises in and around the action area. Over the

longer term, the Tribe would have opportunities to bolster the tribal tourism sector of the reservation economy, as media stories would increase public awareness of the Makah whale hunt and the Tribe's whale hunting traditions. Boycott attempts, however, could reduce any long-term benefits from tourism.

Compared to the No-action Alternative, the potential for whale products to become available to Makah households for consumption and the making and selling of handicraft articles would increase as a result of the resumption of Makah whale hunting. The increased potential for whale products to become available for household consumption and the making and selling of traditional handicraft articles would have a beneficial effect on Makah households.

Compared to Alternative 2, Alternative 4 would be expected to result in fewer days with hunt-related trips (7 every other year, 3.5 per year on average) on which there could be increased business activity caused by an influx of visitors. In addition, the maximum number of whales struck or harvested would be limited to one ENP male whale per year under current conditions. Alternative 4 would thus have a smaller increase (relative to the No-action Alternative) in the amount of whale products available for household consumption, and manufacturing and selling of traditional handicrafts than would Alternative 2.

4.7.3.4.2 Ceremonial and Subsistence Resources

In contrast to the No-action Alternative, Alternative 4 would have multiple positive ceremonial and subsistence effects on the Makah Tribe associated with a resumption of whale hunting. Alternative 4, like the other action alternatives, would be consistent with the Makah's stated need for the whale hunt, which is to allow the Tribe to exercise its treaty whale hunting rights to provide a traditional subsistence resource to the community and to sustain and revitalize the ceremonial, cultural, and social aspects of its whale hunting traditions.

Under Alternative 4, the maximum number of whales struck or harvested would be limited to one ENP male whale every other year under current conditions. Consequently, the positive ceremonial and subsistence effects that the Makah would experience as a result of a resumption of whale hunting could be smaller under Alternative 4 than under Alternatives 2 and 3, under which up to 4 whales could be harvested per year. Alternative 4, like the other action alternatives, would nevertheless be consistent with the Makah's stated need for the whale hunt.

4.7.3.4.3 Social Environment

In contrast to the No-action Alternative, the benefits to the social environment (for example, increased social bonding within the Makah Tribe) that the Tribe attributes to whale hunting would be realized.

However, social tensions exist between tribal members who support the hunt and those who do not. Whale hunts under Alternative 4 would probably exacerbate these tensions. There is insufficient information to determine whether the potential social benefits to the Makah Tribe would offset the potential adverse social effects. Consequently, it is impossible to determine if Alternative 4 would result in disproportionately high and adverse social effects.

Alternative 4 would make it possible for the Tribe to carry on traditional whale hunting that is sanctioned by the IWC. In contrast to the No-action Alternative, permitting the Tribe to engage in traditional activities such as whale hunting would likely be reassuring to other Native Americans.

Under Alternative 4, the maximum number of whales struck or harvested would be limited to one ENP male whale per year under current conditions (refer to Table 4-7). Consequently, there would be fewer occasions for hunt-related social interactions compared to Alternatives 2 and 3, under which up to 4 whales could be harvested per year.

4.7.3.5 Alternative 5, Split-season Hunt

4.7.3.5.1 Economics

In comparison to the No-action Alternative, there could be a minor increase, as under Alternative 2, in the level of business activities of tourist-related enterprises in and around the action area. Over the longer term, the Tribe would have opportunities to bolster the tribal tourism sector of the reservation economy, as media stories would increase public awareness of the Makah whale hunt and the Tribe's whale hunting traditions. Boycott attempts, however, could reduce any long term benefits from tourism.

Compared to the No-action Alternative, the potential for whale products to become available to Makah households for consumption and the making and selling of handicraft articles would increase as a result of the resumption of Makah whale hunting. The increased potential for whale products to become available for household consumption and the making and selling of traditional handicraft articles would have a beneficial effect on Makah households.

Compared to Alternatives 2 and 3, Alternative 5 would be expected to result in fewer days with hunt-related trips (22 versus 60) on which there could be increased business activity caused by an influx of visitors. In contrast, Alternative 5 would have approximately six times as many days with hunt-related trips compared to Alternative 4. Based on the constraints imposed by the hunting season and the PCFG mortality limit, it is expected that the Tribe would harvest up to one whale per year, although the maximum allowable limit would be greater (Subsection 4.1.5, Alternative 5). Thus, the maximum possible increase (relative to the No-action Alternative) in the amount of whale products available for

household consumption, and manufacturing and selling of traditional handicrafts under Alternative 5 would be similar to that anticipated under Alternative 2, although the actual increase would likely be much smaller.

4.7.3.5.2 Ceremonial and Subsistence Resources

In contrast to the No-action Alternative, Alternative 5 would have multiple positive ceremonial and subsistence effects on the Makah Tribe associated with a resumption of whale hunting. Alternative 5, like the other action alternatives, would be consistent with the Makah's stated need for the whale hunt, which is to allow the Tribe to exercise its treaty whale hunting rights to provide a traditional subsistence resource to the community and to sustain and revitalize the ceremonial, cultural, and social aspects of its whale hunting traditions.

Under Alternative 5, hunting would be restricted to two 3-week periods in December and May each year. In addition, the landing of a single PCFG whale, or the striking and losing of a single whale, would end the hunt for any given year. Consequently, the positive ceremonial and subsistence effects that the Makah would experience as a result of a resumption of whale hunting could be smaller under Alternative 5 than under Alternatives 2, 3, 6, and 7 under which an average of 2 to 4 whales could be harvested per year. Alternative 5, like the other action alternatives, would nevertheless be consistent with the Makah's stated need for the whale hunt.

4.7.3.5.3 Social Environment

In contrast to the No-action Alternative, the benefits to the social environment (for example, increased social bonding within the Makah Tribe) that the Tribe attributes to whale hunting would be realized. However, social tensions exist between tribal members who support the hunt and those who do not. Whale hunts under Alternative 5 would probably exacerbate these tensions. There is insufficient information to determine whether the potential social benefits to the Makah Tribe would offset the potential adverse social effects. Consequently, it is impossible to determine if Alternative 5 would result in disproportionately high and adverse social effects.

Alternative 5 would make it possible for the Tribe to carry on traditional whale hunting that is sanctioned by the IWC. In contrast to the No-action Alternative, resuming traditional activities such as whale hunting would likely be reassuring to other Native Americans.

The amount of social benefit the Makah Tribe experiences under Alternative 5 would probably be the same as under Alternatives 2, 3, and 4.

4.7.3.6 Alternative 6, Different Limits on Strikes and PCFG, and Limited Duration of Regulations and Permits

4.7.3.6.1 Economics

Alternative 6 would have the same conditions as Alternative 2 regarding the hunt area, season, and methods and would, therefore, be expected to result in the same number of days with hunt-related trips. For this reason, in both the short term and the long term, the potential effects, relative to the No-action Alternative, on tourist-related business activity under Alternative 6 would likely be the same as those under Alternative 2.

Like Alternatives 2 and 3, Alternative 5 would be expected to result in 60 days per year of hunt-related trips on which there could be increased business activity caused by an influx of visitors. This increased activity could be substantially greater than under Alternatives 4 and 5, which would likely have fewer days with hunt-related trips (3.5 on average and 11 days, respectively). Alternative 6 would include greater restrictions than Alternative 2 on the maximum number of whales that could be killed per year and per 2 years, resulting in a maximum of 3.5 whales harvested per year on average. As a result, Alternative 6 would result in an increase, compared to the No-action Alternative, in the amount of whale products available for household consumption, and manufacturing and selling of traditional handicrafts. This increase would be less than under Alternatives 2 and 3 (under which up to 4 whales could be harvested in a given year) but greater than under Alternative 4 (under which a maximum of one whale could be harvested every other year under current conditions) and Alternative 5 (under which up to one whale could be harvested per year). The potential for replacement of foods that Makah families would otherwise have to purchase and increased income for households that participate in the making and selling of traditional handicrafts would be smaller than under Alternative 2, although greater than under the No-action Alternative.

4.7.3.6.2 Ceremonial and Subsistence Resources

In contrast to the No-action Alternative, Alternative 6 would have multiple positive ceremonial and subsistence effects on the Makah Tribe associated with a resumption of whale hunting. Alternative 6, like the other action alternatives, would be consistent with the Makah's stated need for the whale hunt, which is to allow the Tribe to exercise its treaty whale hunting rights to provide a traditional subsistence resource to the community and to sustain and revitalize the ceremonial, cultural, and social aspects of its whale hunting traditions.

Compared to Alternative 2, limits on the maximum number of whales that could be killed per 2 years would result in fewer whales harvested, on average, per year. Consequently, the positive ceremonial and subsistence effects that the Makah would experience as a result of a resumption of whale hunting

could be smaller under Alternative 6 than under Alternatives 2 and 3 but greater than under the No-action Alternative or Alternatives 4 and 5. Alternative 6, like the other action alternatives, would be consistent with the Makah's stated need for the whale hunt.

4.7.3.6.3 Social Environment

In contrast to the No-action Alternative, the benefits to the social environment (for example, increased social bonding within the Makah Tribe) that the Tribe attributes to whale hunting would be realized. However, social tensions exist between tribal members who support the hunt and those who do not. Whale hunts under Alternative 6 would probably exacerbate these tensions. There is insufficient information to determine whether the potential social benefits to the Makah Tribe would offset the potential adverse social effects. Consequently, it is impossible to determine if Alternative 6 would result in disproportionately high and adverse social effects.

Alternative 6 would make it possible for the Tribe to carry on traditional whale hunting that is sanctioned by the IWC. In contrast to the No-action Alternative, officially allowing the Tribe to resume traditional activities such as whale hunting would likely be reassuring to other Native Americans .

The ability to resume hunting gray whales under Alternative 6 would probably result in the Makah Tribe experiencing the same amount of social benefit as under Alternatives 2, 3, 4, and 5.

4.7.3.7 Alternative 7, Composite Alternative—Preferred

4.7.3.7.1 Economics

Alternative 7 would have the same conditions as Alternative 2 regarding the hunt area and methods and, in winter/spring hunts, would have the same hunt season. In summer/fall hunts, the timing of the hunt would be similar to Alternative 4. Hunt-related trips would likely occur on an average of 37 days per year over the proposed 10-year waiver period, with approximately 60 days with hunt-related trips annually in the winter/spring hunts and up to 14 days with hunt-related trips annually in summer/fall hunts. As a result of this alternating hunt season schedule under Alternative 7, potential impacts to tourism are difficult to compare with Alternatives 2 through 6. Over the proposed 10-year waiver period, impacts under Alternative 7's winter/spring hunts would occur on fewer days than estimated for Alternatives 2, 3, 5, and 6. These hunts would also occur during the winter/spring when there would be less activity in these sectors. Impacts under Alternative 7's summer/fall hunts would occur over an estimated 70-140 days during the summer/fall, which is the more than estimated for Alternative 4 (up 35 days over 10 years). It is expected that hunt-related activities would have greater impacts during the summer/fall when there is generally more traffic and tourism in the vicinity of the hunt area. For this reason, it is possible that Alternative 7 would result in greater impacts to tourism than Alternatives 2, 3, 5, and 6, which do not allow hunting during the summer/fall. Similarly, Alternative 7 would likely have

greater impacts than Alternative 4 due to the greater number of summer/fall hunt days over the course of the waiver period. The relative impacts to tourism of Alternative 7's three sub-alternatives are described above in Subsection 4.6, Economics.

Alternative 7 would include greater restrictions than Alternatives 2, 3, and 6 on the maximum number of whales that could be harvested per year, resulting in a maximum of 2 whales harvested per year on average. As a result, Alternative 7 would result in an increase, compared to the No-action Alternative, in the amount of whale products available for household consumption, and the manufacturing and selling of traditional handicrafts. This increase would be less than Alternatives 2, 3, and 6 (under which a maximum of 4, 4 and 3.5 whales may be harvested per year, respectively) but greater than Alternatives 4 and 5. A reduction in the number of winter/spring hunts over the waiver period, however, could reduce the availability of whale products for household consumption. The relative impacts of Alternative 7's three sub-alternatives on the availability of whale products are described above in Subsection 4.6, Economics.

4.7.3.7.2 Ceremonial and Subsistence Resources

In contrast to the No-action Alternative, Alternative 7 would have multiple positive ceremonial and subsistence effects on the Makah Tribe associated with a resumption of whale hunting. Alternative 7, like the other action alternatives, would be consistent with the Makah's stated need for the whale hunt, which is to allow the Tribe to exercise its treaty whale hunting rights to provide a traditional subsistence resource to the community and to sustain and revitalize the ceremonial, cultural, and social aspects of its whale hunting traditions.

Under Alternative 7, the maximum number of whales harvested would be limited to three in winter/spring hunts and one in summer/fall hunts. This results in an average of 2 whales per year over the 10-year waiver period if the Tribe receives authorization to hunt in the winter/spring months. Therefore, the positive effects that the Makah would experience as a result of a resumption of whale hunting could be larger under Alternative 7 than under Alternatives 4 or 5 but smaller than under Alternatives 2, 3, and 6. If the Tribe does not receive authorization to hunt in any winter/spring seasons, the effects under Alternative 7 would be the same or larger than under Alternatives 4 and 5. Implementing a low abundance threshold for the ENP stock may reduce the number of whales harvested under Alternative 7 by reducing the number of authorized hunting years. It is possible that Sub-alternative 7(c) could provide the fewest ceremonial and subsistence resources of the three sub-alternatives, with 7(a) being the likeliest to provide the most, based on the relative likelihood of triggering the three potential thresholds.

4.7.3.7.3 Social Environment

In contrast to the No-action Alternative, the benefits to the social environment (for example, increased social bonding within the Makah Tribe) that the Tribe attributes to whale hunting would be realized. However, social tensions exist between tribal members who support the hunt and those who do not. Whale hunts under Alternative 7 would probably exacerbate these tensions. There is insufficient information to determine whether the potential social benefits to the Makah Tribe would offset the potential adverse social effects. Consequently, it is impossible to determine if Alternative 7 would result in disproportionately high and adverse social effects.

Alternative 7 would make it possible for the Tribe to carry on traditional whale hunting that is sanctioned by the IWC. In contrast to the No-action Alternative, allowing the Tribe to engage in traditional activities such as whale hunting would likely be reassuring to other Native Americans.

Strike limits under Alternative 7 would provide fewer opportunities for hunting than under Alternatives 2, 3, and 6, and, therefore, less social benefit to the Makah Tribe. Conversely, there would be a greater number of whale hunts than under Alternatives 4 and 5, resulting in greater social benefits.

Implementing a low abundance threshold for the ENP stock may reduce the number of whale hunts under Alternative 7. By potentially reducing the number of authorized hunting years and, therefore, the number of strikes over the 10-year waiver period, it is possible that Sub-alternative 7(c) could provide the fewest opportunities for hunting and, therefore, the least social benefit of the three sub-alternatives, with 7(a) being the likeliest to provide the most opportunities for hunting based on the relative likelihood of triggering the three potential thresholds. The social benefit to the Tribe could be reduced under Alternative 7 if they do not receive authorization for one or more winter/spring hunts.

4.8 Social Environment

4.8.1 Introduction

This subsection addresses the potential for the alternatives to affect the social environment of the Makah Tribe, other tribes, and the general public. As described in Subsection 3.8, Social Environment, various groups and individuals either oppose or support the Makah whale hunt. Makah tribal members and other tribes generally support the hunt, while feelings among some tribal members and the general public are more mixed, with many adamantly opposing the hunt. NMFS' denial of a whale hunt under the No-action Alternative could create tension on the part of the Makah and other Indian tribes toward whale hunting opponents and the federal government, depending on the reasons for a denial. Conversely, a decision to authorize a whale hunt, and subsequent hunting, could lead to tensions on the part of whale hunting opponents towards the Makah and other Indian tribes and the federal

government. Regardless of the decision, like-minded groups could experience moments of increased social bonding.

4.8.2 Evaluation Criteria

Any of the alternatives could affect relationships and interactions among members of the Makah Tribe, other tribes, and the general public. These effects would be expressed to varying degrees as social tension or social bonding, depending on the feelings of individual group members about whale hunting. The criteria for determining the potential effects of the alternatives on the social environment are primarily qualitative and based on the anticipated magnitude and duration of changes in social tensions or social bonding. The amount and content of media coverage might intensify protests and local social tensions. The following three subsections describe how social interactions within and among the three interest groups identified in Subsection 3.8, Social Environment, might be affected under the alternatives.

4.8.2.1 Makah Tribal Members

As noted in Subsection 3.10.3.5.1, Makah Whaling, the 1999 whale hunt appeared to bolster social accord within the Makah community. Participants in the hunt reported enduring intense physical and spiritual training, which culminated in a deep bond between whalers (Subsection 3.10.3.5, Contemporary Makah Society). More broadly, most tribal members believe that restoration of whale hunting improved social and cultural conditions on the reservation (Subsection 3.8.3.1, Makah Tribal Members). Based on these experiences, as well as the potential benefits associated with reinforcing cultural identity (Subsection 4.10, Ceremonial and Subsistence Resources), whale hunts under the action alternatives could increase social bonding within the Tribe (relative to the No-action Alternative). Conversely, a decision to deny the Tribe's request to hunt whales could lead to feelings of resentment toward the federal government by those tribal members who support the hunt, depending on the reason for the denial (Subsection 4.10, Ceremonial and Subsistence Resources [Alternative 1, No Action].

A whale hunt might also generate social tension between tribal members who support the hunt and those who do not. Whale hunts under the action alternatives would probably exacerbate tensions (relative to the No-action Alternative), which might be expressed as vocal dissent and public or private criticism of tribal members who speak out against the hunt.

Under the action alternatives, tension would also increase between tribal members who support the hunt and individuals or group members (including some members of other tribes) who oppose the hunt. As mentioned in Subsection 3.8.3.1, Makah Tribal Members, tribal members have expressed frustration

with protesters and others who oppose the hunt, and some engaged in physical conflicts with protesters during the previous hunts.

4.8.2.2 Other Tribes

Many native organizations have expressed support for Makah whale hunting. In addition, some members of other regional tribes have stated the importance of solidarity with the Makah (Subsection 3.8.3.2, Other Tribes). Following the successful hunt in 1999, members of other tribes attended a community potlatch hosted by the Makah, witnessing the proceedings and sharing food. Whale hunts under the action alternatives (relative to the No-action Alternative) would probably increase social bonding between the Makah and other native groups in the region, the United States, and worldwide. At the same time, members of other tribes might be subject to anti-whaling and anti-Indian sentiments expressed by whaling opponents. Similar to the Makah, other tribes might respond to the No-action Alternative with reinforced feelings of disillusionment with the federal government.

4.8.2.3 Other Individuals and Organizations

Subsection 3.8.3.3, Other Individuals and Organizations, describes the range of attitudes about Makah whale hunting held by people locally, statewide, nationally, and internationally, as well as people affiliated with various organizations. Those expressing support for the Makah gray whale hunt have mentioned treaty rights, the relative health of the gray whale population, and the cultural meaning ascribed to whaling by the Makah. Opponents of the hunt have commented on their perceptions of the beauty, intelligence, and community structure of whales; the existence value of gray whales (collectively and individually); the pain individual whales experience if struck or killed in a hunt; and the possibility that the local economy might be impacted by a boycott in response to a whale hunt. Organizations that oppose whaling in general include animal-rights and marine conservation organizations, the whale-watching industry, and anti-treaty constituents.

Based on the experience of previous hunts, whale hunting under the action alternatives would inspire a wide range of feelings among persons and groups who oppose the hunt, including sorrow, frustration, and anger (Subsection 3.8.3.3, Other Individuals and Organizations). These feelings would be based on the concerns listed above, among others. Experience from the hunts and hunt exercises in 1998, 1999, and 2000 indicates that the resulting tensions might be expressed through demonstrations, attempts to interfere with hunt activities, or other forms of protest. These expressions might be directed at Makah tribal members, other tribes, and other individuals and organization members who have expressed support for the Makah whale hunt. Several incidents involving violent or near-violent confrontations between hunt opponents and tribal members occurred before and during the previous hunts (Subsection 3.8.3.3, Other Individuals and Organizations). Other expressions of tension that followed the successful

1999 hunt included death threats and anti-whaling messages delivered to tribal members and the U.S. Coast Guard, as well as incidents of Makah tribal members being refused service in area businesses. Some expressions of social tension directed at the Makah are founded in racism and anti-Indian sentiment, as well as resentment over the previous whale hunts. Such expressions would likely continue under all of the alternatives, including the No-action Alternative.

Relative to the No-action Alternative, a whale hunt could also increase social bonding among whaling opponents through a sense of shared adversity and a common cause. Under the No-action Alternative, hunt opponents might bond by celebrating a decision not to issue a permit. Similarly, supporters of the Makah gray whale hunt may bond through celebration under the action alternatives and through shared frustration under the No-action Alternative.

4.8.3 Evaluation of Alternatives

The following subsections consider the potential for the alternatives to affect the social environment of the Makah Tribe, other tribes, and the general public. Under the action alternatives, each hunt attempt would probably result in protests and media coverage, with the associated effects described above under Subsection 4.8.2, Evaluation Criteria. It is possible that restrictions on the total number of whales harvested, or on the number of identified whales harvested, would reduce the amount and intensity of opposition to a hunt. No information is available that would allow a prediction of the difference in social tensions under alternatives that would place limits on harvest of identified whales versus those that would not. This analysis therefore treats the potential type and magnitude of effects on the social environment as depending on whether hunting occurs, the number of days with hunt-related trips, and the amount and content of associated media coverage. Alternatives that include more hunting expeditions would provide opportunities for more expression of social tension among those with opposing viewpoints, as well as added opportunities for increased bonding among persons sharing similar viewpoints.

As noted in Subsection 3.8.3.3, Other Individuals and Organizations, many people who watch whales in the action area on a regular basis attach existence values to individual PCFG whales that regularly visit the area. It is possible that these people may express greater opposition to alternatives that allow greater numbers of PCFG whales to be killed per year or that would explicitly target identified PCFG whales.

The lowest risk of adverse effects on the social environment would occur under the No-action Alternative because no whale hunts would be permitted and there would be fewer occasions for confrontation between supporters and opponents of whale hunting compared to any of the action

alternatives. Under all of the action alternatives, whale hunts would result in episodes of increased social tension between hunt supporters and opponents. Each hunt would be expected to result in increased tension as well as increased opportunities for social bonding between like-minded observers, compared to the No-action Alternative. The number of occasions that social tensions would likely exceed conditions under the No-action Alternative would likely correspond to the number of days with hunt-related trips under each alternative. The greatest number of days with hunt-related trips (60) would be expected to occur under Alternatives 2, 3, and 6. Hunt-related trips would be expected to occur on an average of 37 days per year under Alternative 7 (60 days in winter/spring hunt years and up to14 days in summer/fall hunt years), 22 days under Alternative 5, and on 7 days every other year under Alternative 4 (3.5 per year on average). Among the action alternatives, therefore, Alternative 4 would have the lowest risk of adverse effects on the social environment, Alternatives 5 and 7 would have a moderate risk, and Alternatives 2, 3, and 6 would have the greatest risk, based on the number of occasions of elevated tension because of whale hunting. Also, under Alternatives 6 and 7, the waiver and implementing regulations would lapse after 10 years, and it is not possible to predict whether they would be replaced with a new waiver and implementing regulations or what the terms of any new waiver and regulations would be. Therefore, the analyses for Alternatives 6 and 7 consider effects only over a 10-year period.

The alternative with the lowest potential of providing benefits to Makah tribal members through social bonding would be the No-action Alternative. Any of the action alternatives would provide some potential for benefits to tribal members through social bonding.

4.8.3.1 Alternative 1, No Action

Under the No-action Alternative, no whale hunt would be permitted, and no whale hunting or associated activities (e.g., ceremonies, celebrations, protests, or law enforcement) would be anticipated. Individuals and organizations who oppose the Makah gray whale hunt would not engage in demonstrations, attempts to interfere with hunt activities, or other forms of protest. There would, therefore, be no potential for episodes of increased social tensions associated with a whale hunt. Supporters of the Makah whale hunt might bond through a sense of shared adversity and a common cause, and hunt opponents (including some Makah tribal members) might bond by celebrating a decision not to authorize a hunt. Similarly, social bonding and other potential social benefits within the Makah Tribe described above and in Section 3 would not be realized under the No-action Alternative. Renker (2018) cited observations of a connection between unhealthy social behaviors and the inability to practice traditional rituals. Such behaviors could become more common among Makah tribal members. In addition, the Makah and other tribes might feel continued tension toward hunt opponents

and the federal government, in part, because of anger over a perceived lack of respect for tribal traditions and treaty rights.

4.8.3.2 Alternative 2, Tribe's Proposed Action

Any whale hunts that occurred under Alternative 2 would result in increased tension between hunt supporters and opponents, compared to the No-action Alternative. As discussed in Subsection 4.8.2, Evaluation Criteria, the potential type and magnitude of effects on the social environment would likely be affected by the number of hunting expeditions. As described in Subsection 4.1, Introduction, there would likely be approximately 60 days with hunt-related trips per year under Alternative 2. The degree of tension expressed by some hunt opponents might also be affected by the number of PCFG whales that could be killed. The maximum number of PCFG whales that could be killed per year under Alternative 2 would be 5, although the actual number would likely be 1.9 (Table 4-1).

Supporters and opponents would be drawn from all three of the interest groups (i.e., Makah tribal members, other tribes, and other individuals and organizations) described above and in Subsection 3.8.3, Existing Conditions. The reactions of individual members of interest groups would be determined primarily by each person's set of values and beliefs. Members of specific organizations, which are generally made up of people who share similar values and beliefs, would likely express similar reactions. Members of local communities and Indian tribes (including the Makah) would be more likely to differ from one another because those groups are often based on cultural, geographical, or familial ties instead of particular belief systems.

Individuals and organizations who oppose the Makah gray whale hunt may engage in demonstrations, attempts to interfere with hunt activities, or other forms of protest. Some tribal members or other hunt supporters may engage in confrontations with protesters. Social tensions might be expressed as described above or in other ways.

4.8.3.3 Alternative 3, Offshore Hunt

Alternative 3 would likely result in the same number of days with hunt-related trips as Alternative 2 and would, therefore, result in the same number of opportunities for the expression of social tension as under Alternative 2, and more opportunities relative to the No-action Alternative. The degree of tension expressed by some hunt opponents might also be affected by the number of PCFG whales that could be killed. The maximum number of PCFG whales that could be killed per year under Alternative 3 would be 4, although the actual number would likely be 1.6 (Table 4-1). Thus, there would be a lower potential for social tension regarding the killing of PCFG whales than under Alternative 2, and greater potential relative to the No-action Alternative.

4.8.3.4 Alternative 4, Summer/Fall Hunt

Alternative 4 would likely result in fewer days with hunt-related trips than Alternatives 2 and 3 (7 every other year compared to 60 per year) and would, therefore, result in fewer opportunities for the expression of social tension than under those alternatives, but more opportunities relative to the No-action Alternative. As under the other action alternatives, the degree of tension expressed by some hunt opponents might also be affected by the number of PCFG whales that could be killed. The potential number of ENP whales killed under Alternative 4 would be determined by the PCFG limit, which would be one every other year under current conditions (refer to Table 4-7), and any whale struck would be counted as a PCFG whale. (Because Alternative 4, like Alternative 2, would allow seven strikes per year, the number of ENP whales potentially killed could be as high as seven, but this would require the PCFG abundance to more than triple, which is highly unlikely). Thus, while the potential for social tension regarding the killing of PCFG whales would be greater than under the No-action Alternative, the potential could be less than under Alternatives 2 and 3. On the other hand, under Alternative 4, tribal hunters would deliberately hunt whales that are likely to be PCFG males. As noted in Subsection 3.8.3.3, Other Individuals and Organizations, many people who watch whales in the action area on a regular basis attach existence values to individual PCFG whales that regularly visit the area. A hunt targeting these whales could increase the social tension within this group beyond the tension that would exist under Alternatives 2 or 3.

4.8.3.5 Alternative 5, Split-season Hunt

Alternative 5 would likely result in fewer days with hunt-related trips than Alternatives 2 and 3 (22 compared to 60) and would, therefore, result in fewer opportunities for the expression of social tension than under those alternatives, but more opportunities relative to the No-action Alternative or Alternative 4 (22 every year compared to 7 every other year). As under the other action alternatives, the degree of tension expressed by some hunt opponents might also be affected by the number of PCFG whales that could be killed. A maximum of one PCFG whale could be killed every year under Alternative 5 (assuming all struck and lost whales are PCFG whales that subsequently die), although the actual number would likely be one whale ever 5 years (Table 4-1). Thus, while the potential for social tension regarding the killing of PCFG whales would be greater than under the No-action Alternative, the potential would be less than under any of the other action alternatives.

4.8.3.6 Alternative 6, Different Limits on Strikes and PCFG, and Limited Duration of Regulations and Permits

Alternative 6 would likely result in the same number of days with hunt-related trips as Alternatives 2 and 3 and would, therefore, result in the same number of opportunities for the expression of social tension, and more opportunities relative to the No-action Alternative. The maximum number of PCFG

whales that could be killed per year (on average) under Alternative 6 would be 3.5, although the actual number would likely be 0.96 (Table 4-1). With respect to the potential for social tension regarding the killing of PCFG whales, Alternative 6 would, therefore, have a lower potential than under Alternatives 2 and 3, and a greater potential than under the No-action Alternative or Alternative 5. The potential could also be greater than under Alternative 4, because of the likelihood of killing more PCFG whales. On the other hand, the deliberate hunting of known whales under Alternative 4 could result in greater potential for social tension than under Alternative 6.

Also, under Alternative 6, the waiver and implementing regulations would lapse after 10 years, and it is not possible to predict whether they would be replaced with a new waiver and implementing regulations or what the terms of any new waiver and regulations would be. Social tension could increase under Alternative 6 if it creates a foreseeable point in time that compels people to elevate their expression of support or opposition to a tribal whale hunt as the 10-year period draws to a close.

4.8.3.7 Alternative 7, Composite Alternative—Preferred

Under Alternative 7, there would likely be 60 days with hunt-related trips in winter/spring hunts and 7 to 14 days with hunt-related trips in summer/fall hunts, or an average of 37 days per year over ten years (300 days for winter/spring hunts and up to 70 days for summer/fall hunts, each divided by 10 years). This would be fewer than under Alternatives 2, 3, and 6, with up to 60 days with hunt-related activities each. Alternatives 4 and 5 involve fewer days with hunt-related activities (7 every other year and 22, respectively) and, therefore, would provide fewer opportunities for both social tension and bonding, unless the Tribe does not receive authorization for any winter/spring hunts during the waiver period.

The maximum number of PCFG whales that could be killed in winter/springs hunts would be 3, although the actual number would likely be 0.82 (Table 4-1). In summer/fall hunt years, the maximum number of PCFG whales that could be killed would be 2, if the first struck whale is struck and lost. This assumes that struck and lost whales subsequently die. This results in a maximum average annual mortality of 2.5 PCFG whales per year over the course of the 10-year waiver period, and a likely average annual mortality 1.4 PCFG whales per year, assuming, precautionarily, that the first struck whale is lost in every summer/fall hunt and the second strike is utilized. This represents a higher potential for social tension regarding the killing of PCFG whales under Alternative 7 than Alternative 4, 5, and 6 but a lower potential than under Alternative 2 and 3. On the other hand, the deliberate hunting of known whales under Alternative 4 could result in greater potential for social tension than under Alternative 7.

Implementing a low abundance threshold for the ENP stock may reduce number of hunting days under Alternative 7. To compare the relative impacts of Sub-alternatives 7(a), 7(b), and 7(c) on the social

environment of the Makah Tribe, other tribes, and the public, we consider the relative likelihood of triggering the low-abundance threshold of each sub-alternative. Sub-alternative 7(c) carries the highest likelihood of reducing the number of authorized hunting years and, therefore, the number of days with hunt-related trips over the waiver period. Sub-alternative 7(a), on the other hand, is most likely to allow hunting to occur during all 10 years of the proposed waiver period. As such, of the three sub-alternatives, 7(a) is likely to result in the most opportunities for social tension and bonding while 7(c) may provide the fewest opportunities.

Also, under Alternative 7, the waiver and implementing regulations would lapse after 10 years, and it is not possible to predict whether they would be replaced with a new waiver and implementing regulations or what the terms of any new waiver and regulations would be. Social tension could increase under Alternative 7 if it creates a foreseeable point in time that compels people to elevate their expression of support or opposition to a tribal whale hunt as the 10-year period draws to a close.

4.9 Cultural Resources

This subsection addresses the potential for the alternatives to affect cultural resources in the action area, including historic sites, archaeological sites, and traditional cultural properties. The analysis considers the potential for whale hunting or related activities to affect physical sites with cultural significance. Ways in which hunt-related activities could affect cultural sites include physical damage from towing a whale to shore, or trampling of sensitive sites by persons observing or participating in a hunt or related activities. Potential effects on cultural practices and the cultural identity of the Makah Tribe are addressed in Subsection 4.10, Ceremonial and Subsistence Resources.

Two historic sites listed on the National Register of Historic Places occur in the waters or shoreline of the Makah U&A (Subsection 3.9.3.1, National Historical Register Sites). These are Tatoosh Island and the Wedding Rock Petroglyphs. In addition, Fort Núñez Gaona – Diah Veterans Park is located in Neah Bay (Subsection 3.9.3.3, Other Culturally Important Sites). Under the No-action Alternative, the potential for adverse effects on these sites would not differ from the potential under current conditions. There is a low risk of intentional or unintentional damage or disturbance by recreational users or other people in the areas where these sites occur.

It is improbable that any of these sites would be affected by activities directly related to harvesting a whale (such as towing the whale to shore, butchering, and transporting whale products from the landing site) under any of the action alternatives. Fort Núñez Gaona – Diah Veterans Park is located on Bayview Avenue in Neah Bay and would not be affected by towing a whale to shore or landing it at Front Beach, which is at the opposite side of the bay. At Tatoosh Island, logistical challenges related to

the transport of people, equipment, and butchered whale products make it unlikely that any whales would be landed at that site. In addition, the Tatoosh Island lighthouse is geographically separate from the rocky shore. Moreover, the island is owned by the Tribe and was traditionally used for landing whales, so few (if any) non-tribal onlookers would be present at the landing site and landing a whale there would be in keeping with Makah cultural tradition. The beach where the Wedding Rock Petroglyphs occur is a remote, off-reservation location that lacks vehicle access, making it an unlikely site for landing whales.

The potential for listed historic sites to be damaged by hunt observers or onlookers is also low. The only site where this could occur is the Wedding Rock Petroglyphs because access to Tatoosh Island is restricted by the Makah Tribe. Although it is unlikely that a whale would be landed at the beach where the Wedding Rock Petroglyphs are found, people could attempt to view hunt activities on the water from the access trail. It is possible that persons viewing a whale hunt might accidentally tread or encroach upon an existing archaeological or historic site. Because many activities associated with whale hunting would occur in marine locations not visible from the shoreline, the possibility of such accidental harm to this site is remote. Any damage to the Wedding Rocks Petroglyphs from shore-based visitors would likely be unrelated to any whale-hunting activities.

Unlisted sites, such as the shell midden sites along eroding beach terraces in the Olympic National Park, are also unlikely to be affected for the reasons described above. Makah whalers would be most likely to choose a beach on the reservation for landing a whale to facilitate access for butchering and celebrations. Moreover, any whale that is landed and butchered would be close to the water's edge and not as far upland as the midden sites.

Many unlisted sacred sites on the Makah Reservation were traditionally used by Makah whalers and their families to prepare for whale hunting. Some ceremonial use of these sites would likely occur under the No-action Alternative, but the use would not necessarily be related to whale hunting. Under the action alternatives, the cultural value of these sacred sites would be enhanced by their use for whale hunting-related ceremonies. As noted in Subsection 3.9.3.3, Other Culturally Important Sites, the only traditional cultural property identified for this analysis is First Beach. Under the No-action Alternative, this site would not be used for any practices directly related to whale hunting. Use of this site for butchering whales under the action alternatives would be consistent with its traditional use by the Makah.

4.10 Ceremonial and Subsistence Resources

4.10.1 Introduction

This subsection addresses the potential for the alternatives to affect the Makah Tribe's efforts to revive ceremonial and subsistence practices associated with hunting and using whales, which in turn affect Makah culture. The Makah Tribe has a long history of hunting whales (Subsection 3.10.3.4, Makah Historic Whaling), as well as culturally significant treaty language reserving the right to hunt whales. Despite a more than 70-year hiatus in hunting whales before the 1999 and 2000 hunts, the Makah have maintained a close cultural and ceremonial association to this traditional activity. Makah ceremonial and subsistence practices associated with whale hunting that are undertaken by some members include preparation for the hunt, the hunt itself, processing and distribution of the products, and consumption of products from the hunt (Subsection 3.10.3.5.1, Makah Whaling). Also important is the satisfaction many tribal members derive from harvesting, preparing, sharing, and eating traditional food; practicing traditional activities and applying and transmitting traditional knowledge; participating in ceremonial practices and spiritual connections associated with whales and whale hunting; and reinforcing cultural identity associated with the whale hunt and related activities (Subsection 3.10.3.5.1, Makah Whaling).

All of the alternatives have the potential to affect the Tribe's ceremonial and subsistence practices and Makah culture (Braund and Associates 2007; Renker 2018). Persons whose ceremonial and subsistence practices could be affected by the alternatives include residents of the Makah Reservation, members of the Tribe who live elsewhere, and nearby tribes. Makah tribal members who live off the reservation could be affected because strong kinship and cultural ties extend beyond the reservation's boundaries. Non-Makah tribes could be affected because of the close social and cultural ties among indigenous people (Subsection 3.8.3.2, Other Tribes).

Potential effects of the alternatives on archaeological resources associated with whale hunting are addressed in Subsection 4.9, Cultural Resources. Potential effects on the exercise of ceremonial and subsistence practices of indigenous people worldwide (by influencing the behavior of other countries toward indigenous people within their borders) are addressed in Subsection 4.17, Regulatory Environment Governing Harvest of Marine Mammals.

4.10.2 Evaluation Criteria

We used several criteria to determine the potential effects of the alternatives on the Tribe's ceremonial and subsistence practices related to whale hunting and the subsistence use of whales. They can be grouped into five categories: (1) access to whale hunting opportunities, (2) subsistence use, (3) traditional knowledge and activities, (4) spiritual connection to whale hunting, and (5) cultural identity.

The following five subsections describe these categories in greater detail and identify how the effects of the alternatives may be assessed and differentiated.

4.10.2.1 Access to Whale Hunting Opportunities

Under the No-action Alternative, no whale hunt would be permitted. Whale hunting would be permitted under the action alternatives, with varying degrees and types of restrictions on the timing of hunts, the area in which hunts may occur, and the number of ENP and PCFG whales that may be killed and/or harvested. The following paragraphs provide information about the ways in which such restrictions on access to whale hunting opportunities could influence the ability of tribal members to engage in ceremonial and subsistence practices. Information is also provided about the Makah's perceptions and expectations regarding hunt timing, hunt location, and harvest limits. Additional information about the potential for hunting restrictions under the alternatives to limit opportunities for hunting and the number of whales harvested is provided in Subsection 4.1, Introduction.

Traditionally, whale hunting occurred year-round, whenever whales were present and there was a need for them (Braund and Associates 2007). Historically, the hunting season for gray whales began in March when they appeared in numbers off Tatoosh Island on their coastal migration north and resumed in November during their migration south. Humpback and gray whales may have remained in the area all summer (Huelsbeck 1994), permitting whale hunting to occur from early spring through the fall (Subsection 3.10.3.4, Makah Historic Whaling). Makah tribal members have indicated a preference for hunting during the spring and fall whale migrations, as well as during the summer (Braund and Associates 2007). Several Makah indicated that the whales are fatter in the fall on their migration south. One individual also expressed a preference for hunting during the spring, observing that summer tourism and fall weather conditions could interfere with whale hunting during those times.

Historically, Makah hunted both on the ocean and on waters in the Strait of Juan de Fuca, depending on weather, wind, and the presence of whales. Any restrictions on location would contrast with traditional hunting, which occurred when and where the whales presented themselves, including in the Strait (Braund and Associates 2007). The Strait of Juan de Fuca provided hunting opportunities where conditions were safer because the weather is calm compared to the coastal portion of the Makah U&A, which can have 25-foot (7.6-m) waves (Braund and Associates 2007). Some Makah tribal members believe that excluding the Strait of Juan de Fuca from their hunting area would place whalers at increased risk, would prohibit them from whale hunting where their ancestors traditionally whaled, and would affect their ability to successfully take a whale (Braund and Associates 2007). No information is available about the distance from shore of historical hunting activities, although Braund and Associates (2007) identified areas close to shore as traditional hunting grounds and noted that shallow areas near

rocks and islands are considered to be better locations for striking whales. It is reasonable to expect that tribal hunters traditionally sought opportunities as close to shore as possible, to minimize the risks associated with hunting on the open ocean as well as the distance over which a harvested whale would need to be towed.

Because the Makah have harvested only one whale in recent history (i.e., the 1999 harvest), there are few current whale harvest data upon which to assess the effect of the size of the harvest in terms of meeting Makah needs. However, as described in Subsection 3.10.3.5.2, Makah Subsistence Consumption, the Makah do rely on subsistence foods for a significant portion of their diet and emphasize marine resources. Furthermore, the 2001 tribal survey found that 81 percent of the respondents consumed whale products (blubber, meat, or oil) obtained from the 1999 hunt, and 87 percent would like to have these products available in the future (Renker 2002) (Subsection 3.10, Ceremonial and Subsistence Resources). According to Renker's 2017 household survey (Renker 2018), 85.7 percent of survey respondents wanted whale meat in their households on a regular basis, and 80.4 percent wanted whale oil on a regular basis.

Sepez (2001) calculated that the Makah households received an estimated 2.4 pounds (1.1 kg) of whale meat (0.55 lbs/0.25 kg) and blubber (1.8 lbs/0.82 kg) per capita from the 1999 whale hunt. Makah members have commented that one whale was not adequate to feed the entire community; it was not large enough to go around as a meaningful source of food (Braund and Associates 2007). According to Sepez's (2001) analysis (Subsection 3.10.3.5.1, Makah Whaling), the 1999 whale harvested by the Makah yielded approximately "2,000 to 3,000 pounds [907.2 to 1,360.8 kg] of meat and 4,000 to 5,000 pounds [1,814.4 to 2,268 kg] of blubber, most of which was consumed at the community potlatch." The Tribe's most recent needs statement (Renker 2018) estimates that harvesting an average of four gray whales per year would yield 8 to 20 pounds (4 to 9 kg) of meat per capita and 16 to 20 pounds (7 to 20 kg) of oil or blubber per capita (and a somewhat smaller amount of whale oil after rendering). Renker (2018) reported that Makah tribal members numbered 2,692 persons, with 1,160 of those living on the reservation, and that whale products would be shared with Makah living in and outside of Neah Bay.

This information indicates that there is a high demand for whale products and that one whale would not likely meet that need. It is uncertain how many whales would be needed to meet contemporary Makah needs. One indicator is the number of whales specified in the Makah Tribe's request to resume whale hunting—i.e., an average of four whales annually or approximately one whale per year per Makah village (Renker 2018). The harvest of four whales annually would be expected to provide a substantial opportunity to the Makah to hunt, process, and share whale products and to prepare for and participate in ceremonial activities associated with whale hunting.

4.10.2.2 Subsistence Use

Subsistence use includes, among other things, harvesting, processing, sharing, and consuming foods. The ability to use a customary resource for subsistence depends on the availability of and access to that resource in traditional harvest locations. The resource must be available in sufficient numbers and of adequate health to allow a locally satisfactory harvest. A satisfactory harvest, in turn, would allow the subsistence community to participate in related activities. Access to resources can be affected by roads or trails that enhance access, by physical barriers (such as demonstrators who block access), by regulatory barriers, or by social barriers (such as an influx of recreational boaters into an area, displacing traditional users or resources). Traditional subsistence users of a resource may derive satisfaction from harvesting, processing, sharing, and consuming traditional foods. These activities reinforce traditional knowledge through use, exchange of knowledge, and training in traditional ways of performing subsistence activities (Subsection 3.10.3.5.2, Makah Subsistence Consumption). Under any of the alternatives, the extent to which the Tribe can engage in subsistence use of whales would depend on the opportunity to hunt and on the number of whales that could be harvested.

4.10.2.3 Traditional Knowledge and Activities

Surviving on locally available resources requires an intimate understanding of the environment based on a long-term relationship with the surrounding land, water, and resources. This knowledge comes from continued interaction with and observation of the surrounding environment and resources through subsistence activities, as well as through oral tradition passed down from elders to other community members and shared by active community residents. Individuals who carry and transfer this knowledge are generally those with a long history of participation in subsistence activities. The more a culturally important activity is practiced, the more likely it is that knowledge of that activity will pass from generation to generation. This valuable knowledge is not simply given away. Instead, community members who perform culturally important activities relay the knowledge, and younger participants earn the right to help as they learn from their elders. In some cases, only a limited number of people know specific skills (e.g., a harpooner) (Subsection 3.10.3.5.1, Makah Whaling).

If there is a hiatus in practicing the activity, the knowledge may be lost. It may take a long time, but eventually knowledge of specific elements of the activity wanes as elders die, especially if the cultural activities are not actively practiced. Maintaining traditional and cultural knowledge regarding whale hunting requires active participation in whale hunting (Subsection 3.10.3.4.1, Cessation of the Hunt).

Along with the knowledge of an activity, there are specific indigenous words (vocabulary) used to describe the activity, preparation for the activity, the hunting equipment, the weather and elements, the food, and ways to prepare the food, composing a seemingly endless and detailed list. Participation in

the traditional activity results in more use of indigenous words and language to describe the activity; this, in turn, results in increased cultural awareness and more people and communities identifying themselves with their indigenous culture (cultural identity through shared language). In time, knowledge, activity, and transmission from generation to generation become part of an oral tradition (Subsection 3.10.3.5.1, Makah Whaling).

Under any of the alternatives, the number of traditional activities tribal members can practice and the number of times they can practice them, as well as the amount of traditional knowledge tribal members can apply and transmit, would depend on the number of opportunities to hunt and harvest whales and the number of whales available for the Tribe to use. The number of opportunities to hunt and the number of whales available would depend upon restrictions on the timing and area of the hunt, the mortality of PCFG whales, and the number of whales that could be harvested.

4.10.2.4 Spiritual Connection to Whale Hunting

Makah whale hunting rituals, spiritual and physical training, songs, dances, and ceremonial activities are well documented historically and in association with the 1999 and 2000 whale hunts (Subsection 3.10.3.4, Makah Historic Whaling, and Subsection 3.10.3.5.1, Makah Whaling). Whale hunts increase participation in ceremonial activities and rituals related to whale hunting. Similarly, the spiritual connection to whale hunting is strengthened as participants prepare for and conduct a whale hunt and then share the proceeds of the harvest. Makah whale hunting reinforces the relationship between the Makah and the whales. Makah tribal lore indicates that when the hunters and family prepare for the hunt and conduct it properly, perform the appropriate rituals, and live the culturally correct way, the whale gives itself to the Makah (Subsection 3.10.3.4, Makah Historic Whaling).

The amount of spiritual connection that tribal members have to whale hunting would depend primarily on the opportunity to hunt. The extent of that opportunity could also affect tribal members' spiritual connection to whale hunting. The extent of the opportunity to hunt would depend upon the extent to which hunting activities would be restricted by limits on the timing and area of the hunt, the mortality of PCFG whales, and the number of whales that could be harvested.

4.10.2.5 Cultural Identity

Under current conditions (the No-action Alternative), the cultural identity of Makah tribal members is expressed in a variety of ways, including fishing, singing, dancing, potlatching, making traditional handicraft articles, and using the Makah language. Subsection 3.10.3.5, Contemporary Makah Society, describes the various activities available to tribal members to experience and strengthen their cultural identity. The Makah tribal and cultural identity associated with whale hunting in particular is well documented (Subsection 3.10.3.5.3, Symbolic Expression of Whaling). Actively hunting whales

enhances the community's connection to its whale hunting history and reinforces the sense of connection to the local marine environment and to ancestors who used the resource in the past. Other measures of cultural identity associated with whale hunting include the following:

- Use of the whale as a cultural symbol
- Pride in whale hunting traditions
- Traditional values of pride, self-esteem, responsibility, and identification with the past
- Local perceptions of community cultural identity with whale hunting
- Tribal identity
- A sense of the community cooperatively working together toward the common cultural goal of preparing to hunt, harvesting, processing, distributing, and eating the product of their communal labor
- A sense of autonomy

The potential for any of the alternatives to reinforce Makah cultural identity associated with whale hunting would depend primarily on the opportunity for tribal members to hunt. The extent to which that cultural identity may be reinforced would depend upon the extent to which hunting activities would be restricted by limits on the timing and area of the hunt, the mortality of PCFG whales, and the number of whales that could be harvested.

4.10.3 Evaluation of Alternatives

The following subsections compare the potential for the alternatives to affect Makah ceremonial and subsistence practices. For each alternative, the analysis considers its effect on ceremonial and subsistence practices, including subsistence uses, traditional knowledge and activities, spiritual connection to whale hunting, and cultural identity that would result from a decision by the federal government to permit or deny the Makah Tribe's request to hunt whales. For those alternatives that would allow hunting, the analysis also considers the effect of hunting regulations on the same set of ceremonial and subsistence practices.

The No-action Alternative carries the greatest risk of adverse effects on the Makah Tribe's ceremonial and subsistence practices associated with whale hunting. This is because under the No-action Alternative no whale hunting would be allowed, so these practices either could not occur or would be restricted. In contrast, Alternatives 2 through 7 would all allow the Makah to hunt whales, with variations in season, area, and harvest limits. Having an opportunity to hunt whales would enable the Tribe to engage more frequently in a greater range of ceremonial and subsistence practices, compared to the No-action Alternative. The amount of increase could be affected by regulations on hunting. Possible regulations include limits on the timing and area where a hunt would be allowed, and on the

number of whales that could be struck, struck and lost, or harvested, including limits on PCFG whales. Alternative 2, with the least restrictive limits on hunting among the action alternatives, would have the greatest potential to benefit the Tribe's ceremonial and subsistence practices associated with hunting whales.

In the following discussions of Alternatives 2 through 7, the degree of change from the No-action Alternative and the comparison to other alternatives are included in the summary of effects subsection. In addition, under Alternatives 6 and 7, the waiver and implementing regulations would lapse after 10 years, and it is not possible to predict whether they would be replaced with a new waiver and implementing regulations or what the terms of any new waiver and regulations would be. Therefore, the analysis for Alternatives 6 and 7 considers effects only over a 10-year period.

4.10.3.1 Alternative 1, No Action

Under the No-action Alternative, no whale hunt would be permitted. Gray whales would continue to be available in that they are abundant in traditional harvest areas, but the Makah would not have access to hunt them. Tribal members could engage in some activities associated with whale hunting, such as performing ceremonies and rituals; building whale-hunting canoes; or processing, sharing, and consuming drift whales or whales incidentally caught in fisheries. However, very few such whales have actually been used in recent times; out of 21 entangled or stranded whales in the past 20 years, only two have been used by the Tribe[17] (Subsection 2.4.2, Subsistence Use of Drift Whales). Moreover, many of the activities the Tribe could continue to pursue have limited cultural value if they are not practiced in connection with actual whale hunts. Many other activities associated with the actual hunt would not be permitted and could not occur, such as approaching, striking, killing, and towing whales to shore.

Under the No-action Alternative, transfer of knowledge related to whale hunting would be limited to discussions of past whale hunting, and revitalized culture bearers who would participate in whale hunting would not be forthcoming. There would be no language and vocabulary growth related to whale-hunting activities, and the oral tradition of whale hunting would focus on historic activities and would not include ongoing participation in this culturally central activity.

Under the No-action Alternative, the opportunity for tribal members to experience a spiritual connection to whale hunting is limited to a connection with past whale hunting. Whale hunting songs

[17] In 1994, the Northwest treaty Indian tribes advised NMFS of their intent to exercise their treaty rights to marine mammals (and this was done with the 1995 whale carcass used by Makah tribal members) (NMFS 1995). However, the Tribe's usual response is to assist the entangled animal, and Tribal biologists have participated in several recent disentanglement efforts, including two humpback whales in 2008 and 2010 (Cascadia Research Collective 2008; 2010a) and the successful disentanglements of gray whales in 2009 and 2013 (NMFS 2013a).

and dances would likely remain within whale hunting families, but the hiatus would continue and there would be little reason or opportunity to perform and share them with the larger community. Without any whale hunting activity, the spiritual connection to whale hunting may eventually wane, and young Makah tribal members would lack any active whaler role models living what the Makah consider a culturally proper life that they could respect, admire, and emulate. The community connection to whale hunting would remain a connection to the past without any present reinforcement based on active participation in whale hunting activities.

Although the amount of whale hunting activity and associated cultural use of whales would not differ from current levels, tribal identity could erode in the absence of opportunities to participate in an activity central to Makah cultural identity. The community would have little or no opportunity or incentive to work cooperatively to prepare for the hunt; to harvest, butcher, share, and eat whale; or to participate in song and dance festivals celebrating a successful harvest. Individual and community pride associated with conducting these activities would not occur, and self-esteem could decline among those Makah tribal members who believe the Tribe should continue to hunt whales.

In addition, because contemporary Makah cultural identity includes the 150-year-old treaty right to hunt whales, this alternative would continue to reinforce the sense that the Makah are not in control of their destiny, and it would undermine a sense of autonomy within the community. For Makah who believe strongly in their cultural heritage and treaty rights, this alternative would reinforce their feeling of disillusionment with the federal government.

4.10.3.2 Alternative 2, Tribe's Proposed Action

Whale hunts would be permitted under Alternative 2. An average of four whales could be harvested per year, with no more than five harvested in a single year and no more than seven whales struck per year. Hunting would be limited to the period from December 1 through May 31 in the coastal portion of the Makah U&A. The limit on the number of PCFG whales killed per year would be three, based on current population estimates (Table 4-3). Only PCFG whales harvested, not whales struck and lost, would be counted toward that limit. As a result, Alternative 2 would be expected to increase the Makah Tribe's opportunities to revive ceremonial and subsistence practices associated with hunting and using whales, compared to the No-action Alternative, but to a limited degree, as discussed below.

4.10.3.2.1 Access to Whale Hunting Opportunities

By allowing hunting only during the winter and spring months, when severe weather would be a frequent occurrence, Alternative 2 would likely limit the number of suitable hunting days to approximately 43 (Subsection 4.1.2.1, Potential Timing of a Hunt and Number of Hunting Days). This in turn could make it difficult to harvest the four whales annually allowed under Alternative 2. In

addition, during 6 months of the year, tribal members would not have the latitude to hunt and harvest whales at opportune times, such as when whales are available, when weather conditions are favorable, or when hunters are prepared.

Restricting whale hunts to the portions of the U&A west of the Bonilla-Tatoosh line would keep the Makah from hunting whales in the Strait of Juan de Fuca. Prohibiting whale hunts in the Strait of Juan de Fuca would preclude access to a traditional hunting area as well as a large area in which hunting could potentially take place. This prohibition would also limit the flexibility of tribal members to hunt in the Strait of Juan de Fuca when weather conditions there are more favorable than in the coastal portion of the Makah U&A. In addition, prohibiting hunting in the Strait of Juan de Fuca would reduce opportunities to hunt a whale close to the community and to butchering sites. A greater distance between the site of a whale kill and the location of the landing beach would mean a greater distance over which the whale carcass would have to be towed, with a greater chance of the meat spoiling.

The Makah Tribe would be allowed to harvest an average of four whales annually, with no more than five whales harvested in any single year. The limit on the number of PCFG whales killed per year would be three, based on current population estimates (Table 4-3). In addition, only PCFG whales harvested, not whales struck and lost, would be counted toward that limit. It is, therefore, unlikely that limits on PCFG whale mortality would restrict the total number of whales that could be harvested per year under Alternative 2.

4.10.3.2.2 Subsistence Use

Under Alternative 2, the opportunity to resume hunting and harvesting whales would increase the Makah Tribe's ability to engage in a broad range of subsistence practices that are currently not possible or are severely limited. Under Alternative 2, the Makah could hunt for gray whales, a traditional marine resource, using many of their traditional methods. Based on the average number of days with favorable ocean conditions, combined with the probability of encountering gray whales, there would be a total of approximately 43 suitable hunting days during the 6-month hunting season, with an additional 17 days when ocean conditions may be suitable for other hunt-related activities (e.g., scouting) (Subsection 4.1.2.1, Potential Timing of a Hunt and Number of Hunting Days [Alternative 2, Tribe's Proposed Action]). The Tribe could harvest as many as four whales per year, and the Makah community could process, share, and consume this traditional food.

Under Alternative 2, the extent to which tribal members would be able to engage in subsistence use activities would thus increase from no opportunity to hunt whales (under the No-action Alternative) to an opportunity to hunt in the coastal portion of the Tribe's U&A on approximately 60 days from December 1 through May 31. The number of whales available for subsistence use would also increase

by up to four harvested whales per year compared to the current potential use of perhaps one drift whale every 10 years[18] (i.e., drift whales or whales incidentally killed in fishing operations) under the No-action Alternative. Under Alternative 2, with its limited hunting season, it may be difficult for the Tribe to harvest the full limit of four whales on average per year. On the other hand, the initial portion of the hunting season under Alternative 2 (i.e., December and January) would overlap with the whales' southward migration when, according to some tribal members, the whales are fatter and would thus provide more products for subsistence use than whales harvested during the late winter/spring northward migration or early in the summer feeding period (which begins around June 1).

The amount of satisfaction tribal members would derive from this increased subsistence use of whales would also likely increase compared to the No-action Alternative. The Tribe's needs statement indicated that 80.4 percent of surveyed households would like whale oil on a regular basis, 85.7 percent would like whale meat on a regular basis, and 63.7 percent would like whale blubber on a regular basis (Renker 2018).

4.10.3.2.3 Traditional Knowledge and Activities

As described above, under the No-action Alternative tribal members may engage in some, but not all, of the traditional activities associated with subsistence use of whales. The ability to actively hunt whales, which is prohibited under the No-action Alternative, would be allowed under Alternative 2, increasing the number of traditional activities that tribal members could practice. Specifically, tribal members could search for and find whales and strike, harvest, and tow whales to shore. The number of times tribal members could participate in searching for and finding whales would increase compared to the No-action Alternative by approximately 60 days per year, from December 1 through May 31. The number of times they could participate in striking, harvesting, and towing whales to shore would increase by up to seven whales struck per year and four whales harvested per year on average. The increase in the number of times these activities are performed would also increase the amount of traditional knowledge associated with the activities, and the opportunities to apply and transmit that knowledge.

In addition to permitting some currently prohibited activities, and, thereby, increasing the number of traditional activities that could be practiced, implementation of Alternative 2 could increase the number of times tribal members engage in activities that are not currently prohibited. Specifically, tribal members are not currently prevented from building large whale-hunting canoes or fabricating and

[18] This is likely an overestimate given that it is rare to find a drift whale that is suitable for human consumption and attempts are made (by the Tribe and others) to free entangled whales.

maintaining whale-hunting equipment, but there is little practical reason for them to do so. If a whale hunt were authorized under Alternative 2, there would likely be an increase in the number of times that tribal members practice these activities.

Similarly, tribal members are not currently prohibited from processing and consuming whale products from drift whales, but the opportunity to do so is limited. The number of times tribal members could participate in processing whales would increase from the current potential of perhaps one drift whale every 10 years to four whales per year. The amount of whale products tribal members could share and consume would similarly increase from one drift whale every 10 years to four whales per year, although limits on hunt timing might make it difficult for tribal members to harvest the full limit.

Under Alternative 2, tribal members would again actively practice the skills necessary to build large whale-hunting canoes; fabricate and maintain whale-hunting equipment; search for and find whales; strike, harvest, and tow whales to shore; butcher and distribute whales; and perform ceremonial songs and dances to celebrate successful hunts. As a result, words and vocabulary related to preparing to hunt, hunting, harvesting, towing, and processing whales, as well as sharing, preparing, and consuming whale products, could become more widely used (Braund and Associates 2007). Makah cultural awareness, both inside and outside of the Tribe, would become more pronounced, and the whale-hunting component of the Makah oral tradition would grow.

In contrast to the No-action Alternative, Alternative 2 would enable new generations to participate in whale hunting activities; develop, apply, and transmit knowledge of whale hunting; and learn and use words related to whale hunting. Makah youth would have active whalers as role models. With a resumption of whale hunting under Alternative 2, the amount of satisfaction tribal members might derive from the practice of traditional activities and the application of traditional knowledge would increase beyond that of the No-action Alternative.

4.10.3.2.4 Spiritual Connection to Whale Hunting

Under Alternative 2, the ability to resume whale hunting could increase the Makah's spiritual connection to whale hunting over the No-action Alternative, as whale-hunting activity could resume and recur year after year. This is because the connection would be current and ongoing, rather than a connection to a past activity that can no longer be pursued (Braund and Associates 2007).

4.10.3.2.5 Cultural Identity

As described above and in Subsection 3.10.3.5, Contemporary Makah Society, Makah tribal members currently have a variety of ways to express and reinforce their cultural identity. Also, as described above and in Subsections 3.10.3.4, Makah Historic Whaling, and 3.10.3.5.3, Symbolic Expression of

Whaling, whale hunting was a culturally central activity in historic Makah society and the Tribe's whale-hunting past remains culturally important. Under Alternative 2, Makah whale-hunting rituals, spiritual training, songs, dances, and ceremonial activities would likely increase compared to the No-action Alternative and would regularly recur, thus reinforcing Makah cultural identity. The opportunity under Alternative 2 to regularly harvest, process, share, and consume whale products could lead to increased communal activities and an increase in tribal members' sense of community. The whale-hunting ceremonies that whalers and family members would follow for the hunt could provide the Makah with an additional social framework, which could contribute to social and spiritual community stability.

4.10.3.3 Alternative 3, Offshore Hunt

Under Alternative 3, as under Alternative 2, whale hunts would be permitted. Alternative 3 would include the same hunting season and the same limits on the number of whales harvested as Alternative 2, but would prohibit Makah hunters from making an initial strike on a gray whale within 5 miles (8 km) of shore and would impose additional restrictions on the mortality of PCFG whales.

The number of whales that could be harvested under Alternative 3 would be the same as under Alternative 2 (an average of four per year, with no more than five in any one year). In contrast to Alternative 2, however, whales struck and lost would be counted toward the annual mortality limit for PCFG whales, potentially reducing the total number of whales that could be harvested in some years. Under some scenarios, it is possible that hunting activities for a given year could be curtailed before any whales are successfully harvested (Subsection 4.1.3, Alternative 3). Compared to Alternative 2, therefore, it is less likely that the Tribe would be able to harvest an average of four whales per year under Alternative 3.

4.10.3.3.1 Access to Whale Hunting Opportunities

Hunt timing would be the same under Alternative 3 as under Alternative 2, resulting in the same practical effects and tribal perceptions and expectations.

As under Alternative 2, hunting would not be allowed in the portion of the Makah U&A that extends into the Strait of Juan de Fuca, resulting in similar constraints on opportunities to hunt in traditional areas close to the community and to butchering sites. The additional restriction under Alternative 3 on hunting within 5 miles (8 km) of shore would further restrict tribal members' ability to hunt whales. Areas close to shore are traditional hunting grounds, and shallow areas near rocks and islands are considered to be better locations for striking whales (Braund and Associates 2007). Whale hunts that take place more than 5 miles (8 km) off shore would have a greater potential to encounter rough seas, compared to hunts closer to shore (i.e., under the other action alternatives), and expose tribal hunters to

greater hazards. In addition, prohibiting hunting within 5 miles (8 km) of shore would further reduce opportunities to kill a whale close to the community and to butchering sites. A greater distance between the site of a whale kill and the location of the landing beach would mean a greater distance over which the whale carcass would have to be towed, with a greater chance of the meat spoiling.

Although Alternative 3 would have the same limits as Alternative 2 on the number of whales that could be harvested, whales struck and lost would be counted toward the annual mortality limit for PCFG whales, potentially reducing the total number of whales that could be harvested in some years. Under some scenarios, it is possible that hunting activities for a given year could be curtailed before any whales are successfully harvested (Subsection 4.1.3, Alternative 3). Compared to Alternative 2, therefore, it is less likely that the Tribe would be able to harvest an average of four whales per year under Alternative 3.

4.10.3.3.2 Subsistence Use

Under Alternative 3, as under Alternative 2, the opportunity to resume hunting and harvesting whales would increase the Makah Tribe's ability to engage in a broad range of subsistence practices that are currently not possible or are severely limited. Under Alternative 3, the Makah could hunt for gray whales, a traditional marine resource, using many of their traditional methods. Based on the average number of days with favorable ocean conditions, combined with the expectation that scouting expeditions would also be prepared to hunt if whales were found, it is assumed for this analysis that hunting could occur on approximately 60 days each year (Subsection 4.1.3.1, Potential Timing of a Hunt and Number of Hunting Days [Alternative 3, Offshore Hunt]). The Tribe could harvest as many as four whales per year, and the Makah community could process, share, and consume this traditional food.

Under Alternative 3, the extent to which tribal members would be able to engage in subsistence use activities would thus increase from no opportunity to hunt whales (under the No-action Alternative) to an opportunity to hunt in the coastal portion of the Tribe's U&A (greater than 5 miles [8 km] off shore) on approximately 60 days from December 1 through May 31. The number of whales available for subsistence use would also increase by as many as four harvested whales per year compared to the current potential use of perhaps one drift whale every 10 years under the No-action Alternative. The amount of satisfaction tribal members would derive from the increased subsistence use of whales would also likely increase compared to the No-action Alternative.

As under Alternative 2, the requirement to hunt only during the winter and spring months could reduce the likelihood of harvesting the full limit of four whales on average per year. The likelihood of attaining the harvest limit would be further reduced by the prohibition on hunting activities within

5 miles (8 km) of shore and by the restrictions on mortality of PCFG whales. As under Alternative 2, whales harvested during their southward migration may be fatter, thus providing more products for subsistence use than whales harvested at other times of year. Compared to Alternative 2, the Tribe's subsistence use of whales would be less under Alternative 3 because no hunting would be allowed within 5 miles (8 km) of shore and because restrictions on the mortality of PCFG whales could result in the curtailment of hunting activities in some years, possibly even before any whales are harvested.

4.10.3.3.3 Traditional Knowledge and Activities

Under Alternative 3, the increase compared to the No-action Alternative in some aspects of traditional knowledge and activities would likely be the same as under Alternative 2 because the restrictions on the hunt area, season, and methods would the same under the two alternatives, with the exception that Makah hunters would be prohibited from making an initial strike on a gray whale within 5 miles (8 km) of shore. This restriction would likely mean that the Tribe would conduct a motorized hunt and not use canoes; however, it would not be expected to result in a different number of days with hunt-related activities than under Alternative 2. Therefore, compared to the No-action Alternative, the increase in traditional knowledge and activities associated with searching for and finding whales under Alternative 3 would likely be similar to Alternative 2.

The number of times tribal members could participate in striking, harvesting, and towing whales to shore would increase by up to six whales struck per year (compared to seven whales per year under Alternative 2) and four whales harvested per year on average. The increase in the number of times these activities are performed would also increase the amount of traditional knowledge associated with the activities, and the opportunities to apply and transmit that knowledge.

Under Alternative 3, as under Alternative 2, the number of times tribal members could participate in activities associated with harvesting and processing whales would increase from the current potential of perhaps one drift whale every 10 years to as many as four whales per year, on average. The amount of whale products tribal members could share and consume would similarly increase from one drift whale every 10 years to four whales per year, although limits on hunt location and on the mortality of PCFG whales might make it difficult for tribal members to harvest the full limit. Under Alternative 3, other aspects of traditional knowledge and activities would likely increase over current conditions to the same extent as under Alternative 2.

Similar to Alternative 2, Alternative 3 would afford tribal members more opportunities, compared to the No-action Alternative, to engage in traditional activities that are currently prohibited, as well as activities that are not currently prohibited. Although it is likely that the Tribe would choose to conduct motorized hunts under Alternative 3, canoe-based hunts would still be possible. Therefore, under

Alternative 3, tribal members could again actively practice the skills necessary to build large whale-hunting canoes; fabricate and maintain whale-hunting equipment; search for and find whales; strike, harvest, and tow whales to shore; butcher and distribute whales; and perform ceremonial songs and dances to celebrate successful hunts. As a result, words and vocabulary related to preparing to hunt, hunting, harvesting, towing, and processing whales, as well as sharing, preparing, and consuming whale products, would likely become more widely used.

In contrast to the No-action Alternative, Alternative 3 would enable new generations to participate in whale hunting activities; develop, apply, and transmit knowledge of whale hunting; and learn and use words related to whale hunting. Makah youth would have active whalers as role models. With a resumption of whale hunting under Alternative 3, the amount of satisfaction tribal members might derive from the practice of traditional activities and the application of traditional knowledge would increase beyond the current level.

Compared to Alternative 2, the Makah Tribe would be able to practice the same number of activities and apply and transmit the same types of traditional knowledge. However, the number of times they could practice both currently allowed and currently prohibited activities, and could apply traditional knowledge, would be less under Alternative 3 than under Alternative 2 because Alternative 3 would be expected to result in a lower chance that the Tribe would be able to harvest four whales per year.

4.10.3.3.4 Spiritual Connection to Whaling

Under Alternative 3, the ability to resume whale hunting would likely increase the Makah's spiritual connection to whale hunting compared to the No-action Alternative, as described under Alternative 2.

4.10.3.3.5 Cultural Identity

Under Alternative 3, the ability to resume whale hunting would likely increase the cultural identity of the Makah compared to the No-action Alternative, as described under Alternative 2.

4.10.3.4 Alternative 4, Summer/Fall Hunt

Under Alternative 4, as under Alternatives 2 and 3, whale hunts would be permitted. Under Alternative 4, whale hunting would be permitted in the same portion of the Makah U&A as under Alternative 2, but the hunting season would extend from June 1 through November 30 instead of December through May. In addition, the maximum number of whales harvested would be limited to one ENP male whale every other year. It is possible that no whales could be harvested in additional years if tribal hunters are unable to locate and strike a known ENP male or if a whale is struck and lost (in which case the hunt would be ended for that year).

4.10.3.4.1 Access to Whale Hunting Opportunities

Hunting during summer under Alternative 4 would enable Makah tribal members to hunt during months with the lowest risk of encountering adverse weather conditions or rough seas that would interfere with hunting opportunities and compromise hunter safety. In addition, hunting would target PCFG whales that are feeding in the action area. Actively feeding whales tend to be found in relatively shallow waters close to shore and remain in the area for extended periods (Subsection 3.4.3.4.2, PCFG Seasonal Distribution, Migration, and Movements), potentially making them more accessible and vulnerable to a strike. Compared to Alternative 2, therefore, Alternative 4 would give tribal hunters greater latitude to hunt and harvest whales at opportune times, based on sea and weather conditions, presence and availability of whales, subsistence need, and preparedness of hunters. The area in which whale hunting would be allowed under Alternative 4 would be the same as under Alternative 2 (i.e., the coastal portion of the Makah U&A, excluding the Strait of Juan de Fuca) and would be expected to result in the same practical effects and tribal perceptions and expectations.

The maximum number of whales that could be harvested under Alternative 4 would be limited to one every other year under current conditions. It is possible, however, that no whales could be harvested in additional years if tribal hunters are unable to locate and strike a known ENP male or if a whale is struck and lost (in which case the hunt would be ended for the year). This would mean that the number of whales harvested under Alternative 4 would be 0 percent to 25 percent of the number of whales (four) specified in the Makah Tribe's request to resume whale hunting. The harvest of zero to one whale per year would thus be expected to provide opportunities for Makah tribal members to engage in ceremonial and subsistence practices that would not be available under the No-action Alternative, but to a lesser degree than under Alternatives 2 and 3.

4.10.3.4.2 Subsistence Use

Under Alternative 4, the opportunity to resume hunting and harvesting whales would increase the Makah Tribe's ability to engage in a broad range of subsistence practices that are currently not possible or are severely limited. Under Alternative 4, the Makah could hunt for gray whales, a traditional marine resource, using many of their traditional methods. Based on the expectation that locating and striking a known ENP male would take no more than 7 days, it is assumed for this analysis that hunting could occur on approximately 7 days every other year (Subsection 4.1.4.1, Potential Timing of a Hunt and Number of Hunting Days [Alternative 4, Summer/Fall Hunt]). The Tribe could harvest up to one whale every other year under current conditions, and the Makah community could process, share, and consume this traditional food.

Under Alternative 4, the extent to which tribal members would be able to engage in subsistence use activities would thus increase from no opportunity to hunt whales under current conditions (the No-action Alternative), to an opportunity to hunt in the coastal portion of the Tribe's U&A on approximately 7 days from June through November (Subsection 4.1.4.1, Potential Timing of a Hunt and Number of Hunting Days) every other year. The number of whales available for subsistence use would also increase by zero to one harvested whale every other year compared to the current potential use of perhaps one drift whale every 10 years under the No-action Alternative. Although this would be an increase over current conditions, the number of whales harvested under Alternative 4 would be 0 percent to 25 percent of the number of whales (four) specified in the Makah Tribe's request to resume whale hunting. Based on the high percentage of Makah residents desiring whale products for consumption and use, limiting the number of whales harvested to one would likely not meet the Makah's need for whale products (Braund and Associates 2007).

The amount of satisfaction tribal members would derive from the increased subsistence use of whales would also likely increase compared to the No-action Alternative. As indicated above, however, an increase of one whale per year would not likely be perceived by tribal members as adequate to meet the Tribe's needs. The Tribe's needs statement indicated that four whales per year would likely be sufficient to meet demand for whale oil, whale meat, and whale blubber (Renker 2018).

Compared to Alternatives 2 and 3, the Tribe's subsistence use of whales would be less under Alternative 4 because under the No-action Alternative no more than one whale could be harvested every other year (compared to four on average under Alternatives 2 and 3) and because restrictions on the mortality of PCFG whales could result in the curtailment of hunting activities in some years, possibly even before any whales are harvested.

4.10.3.4.3 Traditional Knowledge and Activities

Under Alternative 4, the number of times tribal members could participate in searching for and finding whales would increase compared to the No-action Alternative on approximately 7 days every other year with hunt-related activities. The number of times tribal members could participate in striking, harvesting, and towing whales to shore would also increase, with up to one whale struck and harvested every other year under current conditions (refer to Table 4-7). The increase in the number of times these activities are performed would increase the amount of traditional knowledge associated with the activities, and the opportunities to apply and transmit that knowledge.

Under Alternative 4, the number of times tribal members could participate in processing whales would increase from the current potential of perhaps one drift whale every 10 years to as many as one whale every other year. The amount of whale products tribal members could share and consume would

similarly increase from one whale every 10 years to one whale every other year, although limits on the mortality of PCFG whales could reduce that to zero whales in some additional years if a whale is struck and lost. Under Alternative 4, other aspects of traditional knowledge and activities would likely increase, compared to the No-action Alternative, to the same extent as under Alternative 2.

Similar to Alternatives 2 and 3, Alternative 4 would afford tribal members more opportunities, compared to the No-action Alternative, to engage in traditional activities that are currently prohibited, as well as activities that are not currently prohibited. Under Alternative 4, tribal members would again actively practice the skills necessary to build large whale-hunting canoes; fabricate and maintain whale-hunting equipment; search for and find whales; strike, harvest, and tow whales to shore; butcher and distribute whales; and perform ceremonial songs and dances to celebrate successful hunts. As a result, words and vocabulary related to preparing to hunt, hunting, harvesting, towing, and processing whales, as well as sharing, preparing, and consuming whale products, would likely become more widely used.

In contrast to the No-action Alternative, Alternative 4 would enable new generations to participate in whale hunting activities; develop, apply, and transmit knowledge of whale hunting; and learn and use words related to whale hunting. Makah youth would have active whalers as role models. With a resumption of whale hunting under Alternative 4, the amount of satisfaction tribal members might derive from the practice of traditional activities and the application of traditional knowledge would increase beyond the current level.

As under Alternatives 2 and 3, the Makah Tribe would be able to practice the same number of activities and apply and transmit the same types of traditional knowledge. However, the number of times they could practice both currently allowed and currently prohibited activities, and could apply traditional knowledge, would be less under Alternative 4 than under Alternatives 2 and 3.

4.10.3.4.4 Spiritual Connection to Whaling

Under Alternative 4, the ability to resume whale hunting would likely increase the Makah's spiritual connection to whale hunting compared to the No-action Alternative, as described under Alternative 2.

4.10.3.4.5 Cultural Identity

Under Alternative 4, the ability to resume whale hunting would likely increase the cultural identity of the Makah compared to the No-action Alternative, as described under Alternative 2.

4.10.3.5 Alternative 5, Split-season Hunt

Under Alternative 5, as under Alternatives 2, 3, and 4, whale hunts would be permitted. Under Alternative 5, whale hunting would be permitted in the same portion of the Makah U&A as under

Alternatives 2 and 4, but the hunting season would be limited to 3 weeks in December and 3 weeks in May, in contrast to the 6-month-long hunting seasons under Alternatives 2 and 3. During years in which no whales are struck and lost, and no PCFG whales are killed, the maximum limit for the number of whales harvested would be four on average (and no more than five in a single year), the same as under Alternatives 2 and 3. However, the landing of a single PCFG whale or the striking and losing of a single whale would end the hunt for any given year and subsequent years until the PCFG mortality limit accrues to greater than or equal to one. Based on the constraints imposed by the hunting season and the PCFG mortality limit, it is expected that the Tribe would harvest up to one whale per year (Subsection 4.1.5, Alternative 5).

4.10.3.5.1 Access to Whale Hunting Opportunities

The hunting season under Alternative 5 would occur during 3 weeks in December and 3 weeks in May as compared to Alternatives 2 and 3 (i.e., occurring December through May), resulting in the same practical effects and tribal perceptions and expectations. The difficulties associated with not having the latitude to hunt and harvest whales at opportune times would be compounded by the additional limitation on the number of days when hunting would be allowed. By limiting the hunting season to two 3-week periods in December and May, Alternative 5 would reduce the number of potential hunting days to approximately 11 days in May (most likely timing of hunt), compared to 33 days and 43 days under Alternatives 2 and 3, respectively. Compared to Alternatives 2 and 3, therefore, tribal members would have fewer opportunities to hunt, reducing the likelihood of harvesting the four whales annually allowed under Alternative 5. The hunting area under Alternative 5 would be the coastal portion of the Makah U&A, as under Alternatives 2 and 4 and would be expected to result in the same practical effects and tribal perceptions and expectations.

Although the maximum number of whales that could be harvested under Alternative 5 would be four, it is expected that the Tribe would actually harvest no more than one whale every year. This would mean that the number of whales harvested annually under Alternative 5 would be approximately 25 percent of the number of whales (four) specified in the Makah Tribe's request to resume whale hunting. The harvest of zero to one whale per year would thus be expected to provide opportunities for Makah tribal members to engage in ceremonial and subsistence practices that would not be available under the No-action Alternative, but to a lesser degree than under Alternatives 2 and 3.

4.10.3.5.2 Subsistence Use

Under Alternative 5, the opportunity to resume hunting and harvesting whales would increase the Makah Tribe's ability to engage in a broad range of subsistence practices that are currently not possible or are severely limited. Under Alternative 5, the Makah could hunt for gray whales, a traditional marine

resource, using many of their traditional methods. Based on the average number of days with favorable ocean conditions, combined with the probability of encountering gray whales, there would be a total of approximately 15 suitable hunting days (11 of those days in May) during the split hunting season, with an additional 7 days when ocean conditions may be suitable for other hunt-related activities (e.g., scouting in either May or December) (Subsection 4.1.5.1, Potential Timing of a Hunt and Number of Hunting Days [Alternative 5, Split-season Hunt]). The Tribe could harvest as many as four whales per year (although the actual number would likely be between zero and one), and the Makah community could process, share, and consume this traditional food.

Under Alternative 5, the extent to which tribal members would be able to engage in subsistence use activities would thus increase from no opportunity to hunt (under the No-action Alternative) to an opportunity to engage in hunting or hunt-related activities in the coastal portion of the Tribe's U&A on approximately 17 days in May and 5 days in December. The number of whales available for subsistence use would also increase by as many as four whales per year compared to the potential use of perhaps one drift whale every 10 years under the No-action Alternative.

The amount of satisfaction tribal members would derive from the increased subsistence use of whales would also likely increase compared to the No-action Alternative. As indicated above, however, an increase of zero to one whale per year would not likely be perceived by tribal members as adequate to meet the Tribe's needs. The Tribe's needs statement indicated that four whales per year would likely be sufficient to meet demand for whale oil, whale meat, and whale blubber (Renker 2018).

Compared to Alternatives 2 and 3, the Tribe's subsistence use of whales would likely be less under Alternative 5 because the number of whales harvested per year would probably be between zero and one, compared to four on average under Alternatives 2 and 3. Compared to Alternative 4, the Tribe's potential subsistence use of whales could be greater under Alternative 5 because the maximum number of whales harvested per year would be four, compared to one every other year under current conditions under Alternative 4 (refer to Table 4-7). Whether the actual subsistence use would be greater would depend on the Tribe's ability to locate and harvest non-PCFG whales.

4.10.3.5.3 Traditional Knowledge and Activities

Under Alternative 5, the number of times tribal members could participate in searching for and finding whales would increase compared to the No-action Alternative by approximately 22 days per year (17 days in May and 5 days in December). The number of times tribal members could participate in striking, harvesting, and towing whales to shore would increase by up to five whales struck and four whales harvested per year, although the actual number harvested would likely be between zero and one whale per year on average. The increase in the number of times these activities are performed would

also increase the amount of traditional knowledge associated with the activities, and the opportunities to apply and transmit that knowledge.

The number of times tribal members could participate in processing whales would increase from the current potential of perhaps one drift whale every 10 years (under the No-action Alternative) to zero to one whale (and possibly as many as four whales) per year. The amount of whale products tribal members could share and consume would similarly increase from one whale every 10 years to as many as four whales per year, although that number would more likely be between zero and one because of limits on hunt timing and the mortality of PCFG whales.

Similar to Alternatives 2, 3, and 4, Alternative 5 would afford tribal members more opportunities, compared to the No-action Alternative, to engage in traditional activities that are currently prohibited, as well as activities that are not currently prohibited. Under Alternative 5, tribal members would again actively practice the skills necessary to build large whale-hunting canoes; fabricate and maintain whale hunting equipment; search for and find whales; strike, harvest, and tow whales to shore; butcher and distribute whales; and perform ceremonial songs and dances to celebrate successful hunts. As a result, words and vocabulary related to preparing to hunt, hunting, harvesting, towing, and processing whales, as well as sharing, preparing, and consuming whale products, would likely become more widely used.

In contrast to the No-action Alternative, Alternative 5 would enable new generations to participate in whale hunting activities; develop, apply, and transmit knowledge of whale hunting; and learn and use words related to whale hunting. Makah youth would have active whalers as role models. With a resumption of whale hunting under Alternative 5, the amount of satisfaction tribal members might derive from the practice of traditional activities and the application of traditional knowledge would increase beyond the current level.

As under Alternatives 2, 3, and 4, the Makah Tribe would be able to practice the same number of activities and apply and transmit the same types of traditional knowledge. The number of times they could practice both currently allowed and currently prohibited activities, and could apply traditional knowledge, would be less under Alternative 5 than under Alternatives 2 and 3. Based on the anticipated number of days with hunt-related trips, the number of times tribal members could practice both currently allowed and currently prohibited activities, and could apply traditional knowledge, would likely be greater under Alternative 5 than under Alternative 4.

4.10.3.5.4 Spiritual Connection to Whale Hunting

Under Alternative 5, the ability to resume whale hunting would likely increase the Makah's spiritual connection to whale hunting compared to the No-action Alternative, as described under Alternative 2.

4.10.3.5.5 Cultural Identity

Under Alternative 5, the ability to resume whale hunting would likely increase the cultural identity of the Makah compared to the No-action Alternative, as described under Alternative 2.

4.10.3.6 Alternative 6, Different Limits on Strikes and PCFG, and Limited Duration of Regulations and Permits

Under Alternative 6, as under Alternatives 2, 3, 4, and 5, whale hunts would be permitted. Alternative 6 would have the same conditions as Alternative 2 regarding the hunt area, season, and methods. Alternative 6 would include greater restrictions than Alternatives 2 and 3 on the maximum number of whales that could be killed per year and per 2 years, resulting in a maximum of 3.5 whales harvested per year on average. Also, under Alternative 6, the waiver and implementing regulations would lapse after 10 years, and it is not possible to predict whether they would be replaced with a new waiver and implementing regulations or what the terms of any new waiver and regulations would be. Therefore, the analysis for Alternative 6 considers effects only over a 10-year period.

4.10.3.6.1 Access to Whale Hunting Opportunities

Because hunt timing (December through May) and the area in which hunting would be allowed (the coastal portion of the Makah U&A, excluding the Strait of Juan de Fuca) under Alternative 6 would be the same as under Alternative 2, the two alternatives would be expected to result in the same practical effects and tribal perceptions and expectations.

Under Alternative 6, the maximum number of whales that could be killed per year by the Tribe would be determined by the total limit on strikes, which would be not more than four in a single year and seven over 2 years, equating to 3.5 whales per year on average. The average number of whales harvested annually under Alternative 6 would be approximately 88 percent of the number of whales (four) specified in the Makah Tribe's request to resume whale hunting. The harvest of 3.5 whales per year on average would thus be expected to provide opportunities for Makah tribal members to engage in ceremonial and subsistence practices that would not be available under the No-action Alternative, but to a lesser degree than under Alternatives 2 and 3.

4.10.3.6.2 Subsistence Use

Under Alternative 6, the opportunity to resume hunting and harvesting whales would increase the Makah Tribe's ability to engage in a broad range of subsistence practices that are currently not possible or are severely limited. The Makah could hunt for gray whales, a traditional marine resource, using many of their traditional methods. Because Alternative 6 would include the same conditions as Alternative 2 regarding the hunt area, season, and methods, the two alternatives would be expected to result in the same number of days with opportunities for whale hunting and related activities. Under

Alternative 6, the extent to which tribal members would be able to engage in subsistence use activities would thus increase from no opportunity to hunt whales (under the No-action Alternative) to an opportunity to hunt in the coastal portion of the Tribe's U&A on approximately 60 days from December 1 through May 31. Alternative 6 would impose an additional burden on the Makah Tribe's ceremonial and subsistence use of gray whales as it would require the Tribe to submit a new request for waiver and invest resources in the pursuit of a waiver if the Tribe desired to continue hunting gray whales after the initial 10-year waiver and regulations lapse.

The number of whales available for subsistence use under Alternative 6 would increase by 3.5 harvested whales per year on average, compared to the potential use of perhaps one whale every 10 years (i.e., drift whales or whales incidentally caught in fishing operations) under the No-action Alternative. As under Alternative 2, limitations on the hunting season could impede the Tribe's ability to harvest the full limit each year, although the ability to hunt during much of the period of the whales' southward migration could result in the harvest of whales that provide relatively large amounts of products for subsistence use.

The amount of satisfaction tribal members would derive from the increased subsistence use of whales would also likely increase compared to the No-action Alternative. An increase of 3.5 whales on average per year would be slightly less than the amount that might be considered sufficient to meet demand for whale oil, whale meat, and whale blubber (i.e., four whales per year) (Renker 2018).

Compared to Alternatives 2 and 3, the Tribe's subsistence use of whales would likely be less under Alternative 6 because the average number of whales harvested per year would be approximately 3.5, compared to four under Alternatives 2 and 3. Compared to Alternatives 4 and 5, the Tribe's subsistence use of whales could be greater under Alternative 6 because the number of whales harvested per year would be greater than the number (zero to one) anticipated under those two alternatives.

4.10.3.6.3 Traditional Knowledge and Activities

Under Alternative 6, as under Alternative 2, the number of times tribal members could participate in searching for and finding whales would increase compared to the No-action Alternative by approximately 60 days per year. The number of times tribal members could participate in striking, harvesting, and towing whales to shore would increase by up to 3.5 whales struck and 3.5 whales harvested per year, on average. The increase in the number of times these activities are performed would also increase the amount of traditional knowledge associated with the activities, and the opportunities to apply and transmit that knowledge.

The number of times tribal members could participate in processing whales would increase from the current potential of perhaps one drift whale every 10 years to 3.5 whales per year on average. The amount of whale products tribal members could share and consume would similarly increase from one whale every 10 years to 3.5 whales per year, although limits on hunt timing might make it difficult for tribal members to harvest the full limit.

Similar to Alternatives 2, 3, 4, and 5, Alternative 6 would afford tribal members more opportunities, compared to the No-action Alternative, to engage in traditional activities that are currently prohibited, as well as activities that are not currently prohibited. Under Alternative 6, tribal members would again actively practice the skills necessary to build large whale-hunting canoes; fabricate and maintain whale hunting equipment; search for and find whales; strike, harvest, and tow whales to shore; butcher and distribute whales; and perform ceremonial songs and dances to celebrate successful hunts. As a result, words and vocabulary related to preparing to hunt, hunting, harvesting, towing, and processing whales, as well as sharing, preparing, and consuming whale products, would likely become more widely used.

In contrast to the No-action Alternative, Alternative 6 would enable new generations to participate in whale hunting activities; develop, apply, and transmit knowledge of whale hunting; and learn and use words related to whale hunting. Makah youth would have active whalers as role models. With a resumption of whale hunting under Alternative 6, the amount of satisfaction tribal members might derive from the practice of traditional activities and the application of traditional knowledge, would increase beyond the current level.

As under Alternatives 2, 3, 4, and 5, the Makah Tribe would be able to practice the same number of activities and apply and transmit the same types of traditional knowledge. The number of times they could practice both currently allowed and currently prohibited activities and could apply traditional knowledge would be slightly less under Alternative 6 than under Alternatives 2 and 3. Based on the anticipated number of days with hunt-related trips, the number of times tribal members could practice both currently allowed and currently prohibited activities, and could apply traditional knowledge, would likely be greater under Alternative 6 than under Alternatives 4 and 5.

4.10.3.6.4 Spiritual Connection to Whale Hunting

Under Alternative 6, the ability to resume whale hunting would likely increase the Makah's spiritual connection to whale hunting compared to the No-action Alternative, as described under Alternative 2.

4.10.3.6.5 Cultural Identity

Under Alternative 6, the ability to resume whale hunting would likely increase the cultural identity of the Makah compared to the No-action Alternative, as described under Alternative 2.

4.10.3.7 Alternative 7, Composite Alternative – Preferred

Under Alternative 7, as under Alternatives 2 through 6, whale hunts would be permitted. Alternative 7 would have the same conditions as Alternative 2 regarding the hunt area and methods. Alternative 7 would include greater restrictions than Alternatives 2, 3, and 6 on the maximum number of whales that could be killed per year, resulting in an average of 2 whales harvested per year, with a maximum of 3 harvested in winter/spring hunts and a maximum of 1 harvested in summer/fall hunts. Also, under Alternative 7, the waiver and implementing regulations would lapse after 10 years, and it is not possible to predict whether they would be replaced with a new waiver and implementing regulations or what the terms of any new waiver and regulations would be. Therefore, the analysis for Alternative 7 considers effects only over a 10-year period.

Implementing a low abundance threshold for the ENP stock may reduce the number of days with hunt-related trips relative to that which is already analyzed under the Preferred Alternative without a threshold in the following subsections. To compare the relative impacts of Sub-alternatives 7(a), 7(b), and 7(c) on the Tribe's efforts to revive ceremonial and subsistence practices, we consider the relative likelihood of triggering the low-abundance threshold of each sub-alternative. Sub-alternative 7(c) carries the highest likelihood of reducing the number of authorized hunting years and, therefore, the number of whales harvested and the number of days with hunt-related trips over the waiver period. Sub-alternative 7(a), on the other hand, is most likely to allow hunting to occur during all 10 years of the proposed waiver period. As such, of the three sub-alternatives, 7(a) is likely to result in more opportunities to employ ceremonial and subsistence practices, while 7(c) may result in the fewest.

4.10.3.7.1 Access to Whale Hunting Opportunities

During winter/spring hunts, there would be an estimated 60 days of hunt-related activities. During summer/fall hunts there would be 7-14 days with hunt-related trips. To compare the overall impact of Alternative 7 to the impacts of the other six alternatives, we use an annual average number (based on the 10-year span of the waiver period) of 37 days with hunt-related trips. Therefore, access to whale hunting opportunities under Alternative 7 would be lower than Alternatives 2, 3, and 6 (each with 60 days of hunt-related trips) and higher than Alternatives 4 and 5, each with less than 22 days of hunt-related trips—unless the Tribe does not receive authorization for any winter/spring hunts—as well as the No-action Alternative (no trips). The area in which whale hunting would be allowed under Alternative 7 would be the same as under Alternative 2 (i.e., the coastal portion of the Makah U&A, excluding the Strait of Juan de Fuca) and would be expected to result in the same practical effects and tribal perceptions and expectations.

Under Alternative 7, the maximum number of whales that could be harvested per year by the Tribe would three in winter/spring hunts and 1 in summer/fall hunts, or 2 per year on average over the course of the 10-year waiver period. The harvest of 2 whales per year on average would thus be expected to provide opportunities for Makah tribal members to engage in ceremonial and subsistence practices that would not be available under the No-action Alternative but to a lesser degree than under Alternatives 2, 3, and 6.

Due to the alternating hunt years' framework under Alternative 7, there would be a substantial 13-month period (from June 1 to July 1 of the following year) following a winter/spring hunt season during which hunters would not be able to pursue whales for harvest. However, ceremonial and subsistence practices would be promoted by hunt training, which could occur year-round in winter/spring hunt years so long as no more than 353 gray whales were approached each year during hunting expeditions or training exercises. Also, tribal hunters could make training harpoon throws (using a mock harpoon) on up to 18 whales at any time during winter/spring hunt years and on up to 12 whales between July and October in summer/fall hunt years (although these annual limits also include unsuccessful harpoon attempts during actual hunts). The benefits of utilizing ceremonial and subsistence practices could be reduced, however, if the Tribe does not receive authorization for one or more winter/spring hunts during the course of the waiver period.

4.10.3.7.2 Subsistence Use

Under Alternative 7, the opportunity to resume hunting and harvesting whales would increase the Makah Tribe's ability to engage in a broad range of subsistence practices that are currently not possible or are severely limited. The Makah could hunt for gray whales, a traditional marine resource, using many of their traditional methods. Compared to the No-action Alternative, the Tribes opportunity to hunt in the coastal portion of the Tribe's U&A would increase from zero to an average of 37 days per year. Alternative 7, like Alternative 6, would impose an additional burden on the Makah Tribe's ceremonial and subsistence use of gray whales as it would require the Tribe to submit a new request for waiver and invest resources in the pursuit of a waiver if the Tribe desired to continue hunting gray whales after the initial 10-year waiver and regulations lapse.

The number of whales available for subsistence use under Alternative 7 would increase by two harvested whales per year on average, compared to the potential use of perhaps one whale every 10 years (i.e., drift whales or whales incidentally caught in fishing operations) under the No-action Alternative. As under the other action alternatives, limitations on the hunting season and PCFG strike limits could impede the Tribe's ability to harvest the full limit each year, although the ability to hunt

during much of the period of the whales' southward migration in winter/spring hunt years could result in the harvest of whales that provide relatively large amounts of products for subsistence use.

The amount of satisfaction tribal members would derive from the increased subsistence use of whales would also likely increase compared to the No-action Alternative. An increase of two whales on average per year, however, would be less than the amount that might be considered sufficient to meet demand for whale oil, whale meat, and whale blubber (i.e., four whales per year) (Renker 2018).

Compared to Alternatives 2, 3, and 6, the Tribe's subsistence use of whales would likely be less under Alternative 7 because the average number of whales harvested per year would be approximately two, compared to four under Alternatives 2 and 3. Compared to Alternatives 4 and 5, the Tribe's subsistence use of whales could be greater under Alternative 7 because the number of whales harvested per year would be greater than the number (zero to one) anticipated under those two alternatives.

4.10.3.7.3 Traditional Knowledge and Activities

Under Alternative 7, the number of times tribal members could participate in searching for and finding whales would increase compared to the No-action Alternative by an average of 37 days per year. The number of times tribal members could participate in striking, harvesting, and towing whales to shore would increase by up to 2.5 whales struck and 2 whales harvested per year, on average. The increase in the number of times these activities are performed would also increase the amount of traditional knowledge associated with the activities, and the opportunities to apply and transmit that knowledge.

The number of times tribal members could participate in processing whales would increase from the current potential of perhaps one drift whale every 10 years to 2 whales per year on average. The amount of whale products tribal members could share and consume would similarly increase from one whale every 10 years to 2 whales per year on average, although limits on hunt timing and PCFG strike limits might make it difficult for tribal members to harvest the full limit each year.

Similar to Alternatives 2 through 6, Alternative 7 would afford tribal members more opportunities, compared to the No-action Alternative, to engage in traditional activities that are currently prohibited, as well as activities that are not currently prohibited. Under Alternative 7, tribal members would again actively practice the skills necessary to build large whale-hunting canoes; fabricate and maintain whale hunting equipment; search for and find whales; strike, harvest, and tow whales to shore; butcher and distribute whales; and perform ceremonial songs and dances to celebrate successful hunts. As a result, words and vocabulary related to preparing to hunt, hunting, harvesting, towing, and processing whales, as well as sharing, preparing, and consuming whale products, would likely become more widely used.

In contrast to the No-action Alternative, Alternative 7 would enable new generations to participate in whale hunting activities; develop, apply, and transmit knowledge of whale hunting; and learn and use words related to whale hunting. Makah youth would have active whalers as role models. With a resumption of whale hunting under Alternative 7, the amount of satisfaction tribal members might derive from the practice of traditional activities and the application of traditional knowledge, would increase beyond the current level.

As under Alternatives 2 through 6, the Makah Tribe would be able to practice the same number of activities and apply and transmit the same types of traditional knowledge. The number of times they could practice both currently allowed and currently prohibited activities and could apply traditional knowledge would be slightly less under Alternative 7 than under Alternatives 2, 3, and 6. Based on the anticipated number of days with hunt-related trips, the number of times tribal members could practice both currently allowed and currently prohibited activities, and could apply traditional knowledge, would likely be greater under Alternative 7 than under Alternatives 4 and 5.

4.10.3.7.4 Spiritual Connection to Whale Hunting

Under Alternative 7, the ability to resume whale hunting would likely increase the Makah's spiritual connection to whale hunting compared to the No-action Alternative, as described under Alternative 2.

4.10.3.7.5 Cultural Identity

Under Alternative 7, the ability to resume whale hunting would likely increase the cultural identity of the Makah compared to the No-action Alternative, as described under Alternative 2.

4.11 Noise

4.11.1 Introduction

This subsection addresses the potential for the alternatives to affect sensitive noise receptors in the action area, specifically receptors in the human environment. Of particular concern is the potential for noise from hunt-related activities (including vessels, aircraft, or firearms) to disturb residents, businesses, and visitors in the action area. Residential and commercial areas that could potentially be affected by noise from hunt-related activities include properties adjacent to Neah Bay and the Makah Tribal Center, as well as low-density residential areas south of the Wa'atch River on the Pacific coast and near State Route 112 on the Strait of Juan de Fuca. Recreational users of the OCNMS, the Makah Reservation, and the Olympic National Park could also be affected by noise disturbance. The potential for hunt-related noise, including underwater noise, to disturb wildlife species is addressed in Subsection 4.5, Other Wildlife.

4.11.2 Evaluation Criteria

We used two criteria to determine the potential for adverse effects on sensitive noise receptors under the alternatives. The first is the anticipated intensity and duration of noise produced by hunt-related activities (including vessels, vehicles, and aircraft involved in the hunt, protests, media coverage, and law enforcement, as well as weapons used to strike and/or kill a whale). The second is anticipated noise levels at sensitive sites, as indicated by the distance between noise sources and potential receptors.

4.11.2.1 Noise Generated by Hunt-related Activities

Under the No-action Alternative, noise from vehicles, marine vessels, and aircraft is commonly heard throughout the action area. Other sources of noise include commercial areas, sports fields, logging operations, and the foghorn at Tatoosh Island. Natural sounds, such as those of wind and surf, contribute to high ambient noise levels in portions of the action area, particularly in areas close to the shoreline of the Pacific coast and the Strait of Juan de Fuca. A whale hunt and associated activities (such as monitoring, protests, law enforcement, and weapons discharge) would be expected to result in increased noise levels in the action area. Sources of noise from hunt-related activities would include vessels and aircraft (noise would persist for the duration of each hunt), and firearms and explosive devices (noise would be intense and brief). Noise from automobile traffic would not be expected to increase at nearby properties as a result of implementing any of the action alternatives because daily and monthly traffic counts from the period of the previous hunts did not show an appreciable change in traffic volumes in the action area (Subsection 3.13.3.1.2, Vehicle Traffic Patterns During the 1999 Hunt).

It is possible that the number and types of vessels and aircraft participating in each hunting expedition (including observation, protests, law enforcement, and media coverage) would vary under the action alternatives. For example, Alternative 4 (which would allow hunting during summer) could attract more observers because of better weather conditions, or alternatives that allow more hunts might attract less media coverage as whale hunting becomes less of a novelty. Because of the difficulty of predicting such variations and how they might affect the precise numbers of vessels and aircraft participating in each hunt, this analysis assumes each hunting expedition would be accompanied by the same amount of vessel and aircraft activity and associated noise. Vessels and aircraft associated with each hunt would likely be similar to those associated with the previous hunts, described in Subsection 3.11.3.2.1, Atmospheric Noise. The amount of noise generated by vessels and aircraft under each alternative would depend on the number of days of scouting or hunting that are likely to occur.

Weapons that may be used to strike and kill whales are described in Subsection 3.15.3.5.2, Weapons Associated with the Hunt. The Makah propose to strike and secure a whale with a hand-thrown toggle-

point harpoon and to kill it with a .50-caliber rifle. An alternative method for striking a whale would be a hand-thrown darting gun with an explosive grenade. Alternative methods for killing a whale include explosive grenades delivered either by a hand-thrown darting gun or shoulder gun. If a shoulder gun were used, the blast would likely be louder than the noise associated with a rifle. The grenade is designed to detonate after entering the whale. Atmospheric noise from the detonation would be muffled by the surrounding tissue and by the water surrounding the whale and would probably not exceed the noise level of either the rifle or shoulder gun. Underwater noise from the grenade explosion, which would likely be intense, is discussed in Subsection 4.5, Other Wildlife. The amount of noise produced by weapons would depend on the number of whales that may be struck and killed under a given alternative.

4.11.2.2 Noise Levels at Receiving Properties

As a general rule, sound level in an open environment (such as occurs throughout the action area) drops 6 decibels (dB) for every doubling of the distance from the noise source (Occupational Safety and Health Administration 2013). Thus, if a sound has an intensity of 100 dB 50 feet (15.2 m) from the source (a standard distance for measuring noise output levels), the intensity at 100 feet (30.5 m) would be 94 dB; at a distance of 1 mile (1.6 km), the sound level would be approximately 60 dB. Thus, the potential for noise from hunt-related activities to affect sensitive receptors would depend primarily on the distance between the activities and the receptors. Any activities that occur closer to shore would be more audible to receptors on land than activities further off shore. For example, whale hunting during summer may target whales that are feeding in the action area and may therefore take place closer to shore than hunting during winter or spring, which may target migrating whales further off shore. In addition, most recreational visits occur during summer. Whale hunting activities during summer may be audible to more persons on trails and beaches in the Olympic National Park and the Makah Reservation compared to activities at other times of year. Conversely, hunting restrictions that cause whale hunting to occur farther from shore (e.g., by prohibiting hunters from making an initial strike on a gray whale within 5 miles (8 km) of shore) would reduce the potential for hunt-related activities to be audible to persons on shore.

For firearms, the noise level at a receiving property would also depend on the direction the muzzle is facing at the moment of discharge, because gunfire noise is louder in the direction the weapon is pointed. Weapons discharged intentionally during a whale hunt would be pointed at a downward angle toward the whale:

> The rifleman on the chase boat may not discharge his weapon until authorized to fire by a safety officer designated by the whaling captain. The safety officer would not authorize the discharge of the rifle unless the barrel of the rifle is above and within 30

> feet [9.1 m] from the target area of the whale and the rifleman's field of view is clear of all persons, vessels, buildings, vehicles, highways, and other objects or structures that if hit by a rifle shot could cause injury to human life or property (Subsection 2.3.2.2.12, Other Environmental Protection Measures).

It is reasonable to expect that the direction of fire would be away from commercial or residential areas.

Based on observations of the hunts that took place in 1999 and 2000, most hunting under the action alternatives would be expected to take place 1 to 2 miles (1.6 to 3.2 km) off shore, unless explicitly restricted to other areas (Gosho 1999; Gearin and Gosho 2000). Under any of the action alternatives, noise from vessels and weapons would be audible at few, if any, residential or commercial properties, including the Makah Tribal Center. Recreational users of beaches in the OCNMS, the Makah Reservation, and the Olympic National Park would be most likely to hear noise associated with whale hunts under the action alternatives.

Aircraft engaged in monitoring and law enforcement for the hunt would be audible primarily near vessels engaged in hunt-related activities or other vessels that might be in the vicinity of a hunt, such as recreational fishing vessels. Aircraft within OCNMS boundaries would be expected to observe the requirement to stay above an altitude of 2,000 feet (610 m). Increased noise levels (compared to the No-action Alternative) from aircraft taking off and landing would also be audible at commercial and residential properties near the landing pad at Coast Guard Station Neah Bay. Media helicopters would likely arrive from other areas and would be present only near a successful harvest or major protest activity. Aircraft monitoring hunt-related activities that occurred outside the OCNMS (e.g., events at Neah Bay under all action alternatives) would not have to maintain an altitude of at least 2,000 feet (610 m). For this reason, aircraft noise levels at receiving properties in Neah Bay would likely be louder than those along the Pacific coast portion of the Makah U&A.

The area with greatest potential for disturbance from hunt-related activities under any of the action alternatives is Neah Bay, where most protests and law enforcement activities occurred during the previous hunts. If protest vessels moor at Clallam Bay, as they did during the previous hunts, increased noise levels would also be expected there and possibly along the travel route between Clallam Bay and Neah Bay.

4.11.3 Evaluation of Alternatives

The following subsections consider the potential for the alternatives to affect sensitive noise receptors in the action area. For each alternative, the discussion addresses the potential number of occasions on which hunt-related activity may lead to elevated noise levels, as well as the likelihood that such noise would be detectable at sensitive sites.

The lowest risk of adverse effects on sensitive noise receptors would occur under the No-action Alternative because no whale hunts would be permitted. The risk under the action alternatives would increase, with the amount of increase depending on the number of days of scouting and hunting, the number of rifle shots or grenade explosions, and the distance from shore of hunt-related discharges. Table 4-1 identifies those numbers and Subsection 4.1, Introduction, describes the rationale for expecting those numbers.

Compared to the No-action Alternative, the risk of adverse effects on sensitive noise receptors would increase under any of the action alternatives because of increases in noise from motorized vessels and aircraft on days when tribal members are scouting or hunting for whales. The greatest increases in the risk of adverse effects on sensitive noise receptors would occur under Alternatives 2, 3, and 6, under which hunt-related trips would occur on approximately 60 days from December through May (primarily during the months of March through May). As noted above, much of the hunting-related noise under Alternative 3 would likely be inaudible to sensitive receptors on shore because it would occur more than 5 miles (8 km) from shore. The increased risk of adverse effects on sensitive noise receptors because of increases in noise from motorized vessels would be less under Alternatives 5 and 7 than under Alternatives 2, 3, and 6 because hunt-related trips would occur on approximately 22 days in December and May (Alternative 5), or on an average of 37 days per year (Alternative 7). The increased risk would be even less under Alternative 4, under which scouting and hunting would likely occur on only 7 days every other year (albeit during the summer months, when recreational use of trails and beaches would be higher than during the winter and spring months).

Alternative 2 would be expected to result in the greatest increased risk to sensitive noise receptors from weapons discharge, compared to the No-action Alternative, because it would likely result in up to 64 rifle shots or 12 grenade explosions per year, with no restrictions on distance from shore. The increased risk of adverse effects on sensitive noise receptors because of weapons discharge would be less under Alternative 3 because most whale hunting activity would be expected to occur farther off shore than under Alternative 2. The amount of weapons discharge under Alternative 6 and 7 would be less than under Alternatives 2 and 3, with 16 to 56 rifle shots or 3 to 11 grenade explosions per year over 10 years under Alternative 6, or an average of 40 shots or 7.5 grenade explosions per year over 10 years under Alternative 7, but there would be no constraints on distance from shore. This amount would be even less under Alternatives 4 and 5 (0 to 16 rifle shots or 0 to 3 grenade explosions), but there would also be no constraints on distance from shore.

4.11.3.1 Alternative 1, No action

Under Alternative 1, no whale hunt would be permitted, and no whale hunting or associated activities would be expected to occur. The amount of noise-generating activity in the action area under the No-action Alternative would not be expected to differ from current levels (described in Subsection 3.11.3.2, Existing Noise Levels).

4.11.3.2 Alternative 2, Tribe's Proposed Action

Under Alternative 2, vessel and aircraft noise associated with hunt-related trips would likely occur on approximately 60 days from December through May, mostly during April and May. Based on estimates of the number of rifle shots or grenade explosions per whale harvested, Alternative 2 would be likely to result in as many as 64 rifle shots or 12 grenade explosions annually. Compared to the No-action Alternative (under which there would be no hunt-related noise), the noise from vessels, aircraft, and weapons discharge would likely result in increased noise levels at receiving properties in Neah Bay on approximately 43 days each spring and possibly 17 days each winter. There could also be increased noise levels at receiving properties along State Route 112, east of Neah Bay, from protest vessels traveling between Clallam Bay and Neah Bay.

In contrast to the No-action Alternative, increased noise from vessels, aircraft, and weapons associated with whale hunts under Alternative 2 may be audible to recreational users of the OCNMS, the Makah Reservation, and the Olympic National Park. The number of recreational visitors who may be affected would be limited, however, because hunting would be restricted to the winter and early spring months when visitation is comparatively low.

4.11.3.3 Alternative 3, Offshore Hunt

Alternative 3 would include the same hunting season and the same limits on the number of whales harvested as Alternative 2, but would prohibit Makah hunters from making an initial strike on a gray whale within 5 miles (8 km) of shore. As under Alternative 2, vessel and aircraft noise associated with hunt-related trips under Alternative 3 would likely occur on approximately 60 days from December through May, mostly during April and May, and there would be as many as 64 rifle shots or 12 grenade explosions annually. Compared to the No-action Alternative (under which there would be no hunt-related noise), the noise from vessels, aircraft, and weapons discharge would likely result in increased noise levels at receiving properties in Neah Bay on approximately 43 days each spring and possibly 17 days each winter. There could also be increased noise levels at receiving properties along State Route 112, east of Neah Bay, from protest vessels traveling between Clallam Bay and Neah Bay. In addition, noise from vessels, aircraft, and weapons associated with whale hunts under Alternative 3 may be

audible to recreational users of the OCNMS, the Makah Reservation, and the Olympic National Park, in contrast to the No-action Alternative, which would involve no hunt-related noise.

Compared to Alternative 2, Alternative 3 would be likely to result in a smaller increase in noise levels at receiving properties because most hunt activities would take place farther off shore. Although some hunting activities under Alternative 3 could occur less than 5 miles (8 km) from shore (i.e., if a struck whale moves toward shore, and hunters and chase boats would be required to follow it and dispatch it), it is likely that most hunting activities would occur further off shore than under the other action alternatives because all initial strikes would occur more than 5 miles (8 km) off shore.

It is possible that Alternative 3 could result in slightly greater increases in noise levels in Neah Bay and other areas where hunt-related vessels are moored compared to Alternative 2. This is because the number of motorized vessels engaged in each hunt-related trip would likely be greater, based on the expectation that the hunting party would likely be in a motorized vessel rather than a canoe (Subsection 4.1.3.2, Potential Number and Type of Vessels [Alternative 3]). For much of each trip, however, hunt-related vessels would be 5 or more miles (8 or more km) off shore, where they would likely be inaudible to sensitive receptors on shore. In addition, any potential increases in the number of motorized vessels in the hunting party could be offset by a reduction in the number of jet skis used by interested observers, because jet skis may not have sufficient range for an offshore hunt.

4.11.3.4 Alternative 4, Summer/Fall Hunt

Under Alternative 4, the hunting season would extend from June 1 through November 30 instead of December through May. The maximum number of whales harvested would be limited to one ENP male whale every other year under current conditions. Based on the expectation that locating and striking a known ENP male would take no more than 7 days (Subsection 4.1.4, Alternative 4), vessel and aircraft noise associated with scouting and hunting would be likely to occur on approximately 7 days every other year. Alternative 4 may result in as many as 16 rifle shots or 3 grenade explosions every other year, although those values could be much lower if tribal hunters are unable to locate and strike a known ENP male or if a whale is struck and lost (in which case the hunt would be ended for the year).

Compared to the No-action Alternative (under which there would be no hunt-related noise), noise from vessels, aircraft, and weapons discharge would likely result in increased noise levels at receiving properties in Neah Bay on a maximum of 7 days every other year, or 3.5 days per year, on average. There could also be increased noise levels at receiving properties along State Route 112, east of Neah Bay, from protest vessels traveling between Clallam Bay and Neah Bay. In addition, noise from vessels, aircraft, and weapons associated with whale hunts under Alternative 4 may be audible to

recreational users of the OCNMS, the Makah Reservation, and the Olympic National Park, in contrast to the No-action Alternative, which would involve no hunt-related noise.

Alternative 4 would have a greater potential to result in the disturbance of recreational users in the action area than any of the other action alternatives because whale hunts would likely occur during the peak period of recreational use and may target whales that are feeding relatively close to shore (compared to whales that are migrating farther off shore at other times of year). The elevated potential for disturbance would occur on fewer days, however (e.g., 3.5 days under Alternative 4 versus 60 days under Alternative 2).

4.11.3.5 Alternative 5, Split-season Hunt

Under Alternative 5, the hunting season would be 3 weeks in December and 3 weeks in May, in contrast to the 6-month-long hunting seasons under the other action alternatives. In addition, the landing of a single PCFG whale, or the striking and losing of a single whale, would end the hunt for any given year. Based on the constraints imposed by the hunting season and the PCFG mortality limit, it is expected that the Tribe would harvest up to one whale per year, under current conditions (Subsection 4.1.5, Alternative 5).

Based on the length of the hunting season, vessel and aircraft noise associated with hunt-related trips would likely occur on approximately 22 days in December and May, mostly during May. These values could decrease to 0 in years in which the hunt is on hiatus to allow the PCFG mortality limit to re-set at one whale. Based on estimates of the number of rifle shots or grenade explosions per whale harvested, Alternative 5 would be likely to result in as many as 16 rifle shots or 3 grenade explosions annually, or as few as 0 rifle shots and grenade explosions during years in which the hunt is on hiatus.

Compared to the No-action Alternative (under which there would be no hunt-related noise), the noise from vessels, aircraft, and weapons discharge would likely result in increased noise levels at receiving properties in Neah Bay and along State Route 112 east of Neah Bay on approximately 17 days each spring and possibly 5 days each winter. In addition, noise from vessels, aircraft, and weapons associated with whale hunts under Alternative 5 may be audible to recreational users of the OCNMS, the Makah Reservation, and the Olympic National Park, in contrast to the No-action Alternative, which would involve no hunt-related noise.

Compared to Alternatives 2 and 3, Alternative 5 would be expected to result in fewer days with hunt-related trips (22 compared with 60) and therefore a smaller increase (compared to the No-action Alternative) in aircraft and vessel noise at receiving properties. Similarly, Alternative 5 would result in a smaller increase in noise from weapons discharges because of the smaller number of discharges. Compared to Alternative 4, Alternative 5 would result in more days of hunt-related trips (22 compared

with an average of 3.5) and similar numbers of weapons discharges (0 to 16 rifle shots and 0 to 3 grenade explosions) and would therefore result in a slightly greater increase in noise.

4.11.3.6 Alternative 6, Different Limits on Strikes and PCFG, and Limited Duration of Regulations and Permits

Under Alternative 6, the waiver and implementing regulations would lapse after 10 years, and it is not possible to predict whether they would be replaced with a new waiver and implementing regulations or what the terms of any new waiver and regulations would be. Therefore, the analysis for Alternative 6 considers effects only over a 10-year period.

Alternative 6 would have the same conditions as Alternative 2 regarding the hunt area, season, and methods and would, therefore, result in the same number of scouting and hunting days. Alternative 6 would include greater restrictions than Alternatives 2 and 3 on the maximum number of whales that could be killed per year and per 2 years. Based on estimates of the number of rifle shots or grenade explosions per whale harvested, Alternative 6 would be likely to result in as many as 56 rifle shots or 11 grenade explosions annually.

Compared to the No-action Alternative (under which there would be no hunt-related noise), the noise from vessels, aircraft, and weapons discharge would likely result in increased noise levels at receiving properties in Neah Bay and along State Route 112 east of Neah Bay on approximately 60 days (likely 43 days in spring and possibly 17 days in winter), the same as under Alternatives 2 and 3. In addition, noise from vessels, aircraft, and weapons associated with whale hunts under Alternative 6 may be audible to recreational users of the OCNMS, the Makah Reservation, and the Olympic National Park, in contrast to the No-action Alternative, which would involve no hunt-related noise. Based on the anticipated number of weapons discharges, Alternative 6 would result in a smaller increase in noise from weapons discharges than Alternative 2 or Alternative 3 and a larger increase than Alternatives 4 or 5.

4.11.3.7 Alternative 7, Composite alternative – Preferred

Under Alternative 7, like Alternative 6, the waiver and implementing regulations would lapse after 10 years, and it is not possible to predict whether they would be replaced with a new waiver and implementing regulations or what the terms of any new waiver and regulations would be. Therefore, the analysis for Alternative 7 considers effects over a 10-year period.

As with the other action alternatives, Alternative 7 would result in increased effects on sensitive noise receptors compared to the No-action Alternative (although much of the hunting-related noise under Alternative 3 would likely be inaudible to sensitive receptors on shore because it would occur more than 5 miles (8 km) from shore). These noise effects would come from motorized vessels and aircraft

on days when tribal members are scouting or hunting for whales, and from weapons discharged during a hunt. The area with the greatest potential for disturbance from hunt-related activities under any of the action alternatives is Neah Bay, where most protests and law enforcement activities occurred during the previous hunts. If protest vessels moor at Clallam Bay, as they did during the previous hunts, increased noise levels would also be expected there and possibly along the travel route between Clallam Bay and Neah Bay.

During winter/spring hunt seasons, whale hunts would likely occur on approximately 60 days from December through May, provided the Tribe receives an ITA for WNP whales, allowing them to hunt in those months. Based on estimates of the number of rifle shots or grenade explosions per whale harvested, Alternative 7 would be likely to result in as many as 48 rifle shots or 9 grenade explosions annually. In contrast to the No-action Alternative (under which there would be no hunt-related noise), increased noise from vessels, aircraft, and weapons associated with whale hunts under Alternative 7 may be audible to recreational users of the OCNMS, the Makah Reservation, and the Olympic National Park. The number of recreational visitors who may be affected would be limited, however, because hunting would be restricted to the winter and early spring months when visitation is comparatively low

During summer/fall hunt seasons, whale hunts would likely occur on 7-14 days from July through October. Based on estimates of the number of rifle shots or grenade explosions per whale harvested, Alternative 7 would be likely to result in as many as 32 rifle shots or 6 grenade explosions in summer/fall hunt years. In contrast to the No-action Alternative, increased noise from vessels, aircraft, and weapons associated with whale hunts under Alternative 7 may be audible to recreational users of the OCNMS, the Makah Reservation, and the Olympic National Park. Like Alternative 4, Alternative 7 would have a greater potential to result in the disturbance of recreational users in the action area than the other action alternatives because whale hunts would likely occur during the peak period of recreational use and may target whales that are feeding relatively close to shore (compared to whales that are migrating farther off shore at other times of year). The elevated potential for disturbance each year would occur on fewer days, however (e.g., 7-14 days under Alternative 7 versus 22-60 days under Alternatives 2, 3, 5, and 6).

To compare the overall impact of Alternative 7 to the impacts of the other six alternatives, we use an annual average number (based on the 10-year span of the waiver period) of 37 days with hunt-related trips and up to 40 rifle shots and 7.5 explosive projectiles to harvest an average of two whales per year. Alternative 7 would therefore result in a lower potential for adverse effects than Alternatives 2, 3, and 6, each with 60 days of hunt-related trips and higher numbers of shots/explosions. However, Alternative 7 would result in a greater risk than the No-action Alternative (0 days and 0

shots/explosions), as well as Alternatives 4 and 5, each with less than 22 days of hunt-related trips and fewer than 32 shots and 6 explosions, unless the Tribe does not receive authorization for any winter/spring hunts over the waiver period.

Implementing a low abundance threshold for the ENP stock may reduce the overall amount of noise generated during the 10-year waiver period. To compare the relative impacts of Sub-alternatives 7(a), 7(b), and 7(c), we consider the relative likelihood of triggering the low-abundance threshold of each sub-alternative. Sub-alternative 7(c) carries the highest likelihood of reducing the number of authorized hunting years and, therefore, the annual average number of hunt-related trips, rifle shots, and explosive projectiles used over the waiver period. Sub-alternative 7(a), on the other hand, is most likely to allow hunting to occur during all 10 years of the proposed waiver period. As such, of the three sub-alternatives, 7(c) could result in the lowest potential impact to sensitive noise receptors while 7(a) could result in the greatest potential noise impact.

4.12 Aesthetics

4.12.1 Introduction

This subsection addresses the potential for the alternatives to result in adverse aesthetic effects on observers based on the potential for viewers to see a whale hunt, either directly or through the media. Media images of the previous hunt prompted reactions ranging from revulsion to admiration. Analyses in this subsection consider the effects on observers who may be present at sites with direct views of a whale hunt (including views of a whale dying, being towed to shore, and/or being butchered), as well as those who may see such images through various media outlets. Whale hunting and related activities under the action alternatives would be short term and localized and would take place upon the water; such activities, therefore, would not affect natural visual resources in the action area, such as stacks, pillars, and islands (Subsection 3.12.3.1, Visual Resources in the Action Area).

4.12.2 Evaluation Criteria

We used two criteria to determine the potential for aesthetic effects under the alternatives. The first is the anticipated number of persons who may be present at sites that may offer views of hunt-related activities, as well as their expectations (that is, whether individuals may encounter views of hunt-related activities without intending to do so). The second criterion includes the anticipated amount, intensity, duration, scope, and content of media coverage. The following two subsections discuss these matters in greater detail and identify how the effects of the alternatives may be assessed and differentiated.

4.12.2.1 On-scene Observers

Analyses in this subsection consider two groups of potential observers: interested observers and casual observers. Interested observers include those who would actively seek viewing opportunities out of concern about the outcome of the hunt, as well as persons engaged in monitoring, law enforcement, and media coverage. Casual observers include persons, such as recreational users in portions of the OCNMS, Olympic National Park, and Makah Reservation, who may encounter views of hunt-related activities without expecting to do so.

Under any of the alternatives, the number of opportunities for interested observers to view whale hunts would depend on the number of days on which hunting occurs, as well as the distance of hunting from shore. On days with hunting, interested observers would have the opportunity to view a whale being hunted, towed to shore, or butchered; no such opportunities would occur on days when no hunting occurs. (Note that analyses in this subsection focus on days of actual hunting, rather than hunt-related activities (i.e., training or scouting), because there would be no opportunities to view a whale being hunted, towed to shore, or butchered on days when only training or scouting occurs.) Based on observations of the hunts that took place in 1999 and 2000, most hunting under the action alternatives would be expected to take place 1 to 2 miles (1.6 to 3.2 km) off shore, unless explicitly restricted to other areas. At this distance, hunt activities would be visible from few, if any, land-based vantage points. Any activities that occur closer to shore (e.g., towing a harvested whale to shore and butchering it) would be more readily viewed. Also, hunting that occurs during the summer (i.e., under Alternative 4) would likely target whales that are feeding in the action area, and may therefore take place closer to shore than hunting that targets migrating whales further off shore.

As with interested observers, the number of opportunities for casual observers to view whale hunts would depend on the number of days on which hunting occurs and the distance of hunting from shore. In addition, the number of casual observers who could see hunt activity on the water (including pursuits, strikes, and possibly the death of a whale) would vary seasonally, with the greatest number of potential observers during the peak visitation period from June through September. The potential for inadvertent encounters with views of whale hunting would occur mostly from hiking trails and beaches along the Pacific coastal portion of the action area, and from a limited number of road-based locations on the Makah Reservation (Subsection 3.12.3.2, Vantage Points and Viewing Opportunities). Similar to interested observers, casual observers would be able to view hunt activities from few, if any, land-based vantage points.

The number of potential observers (interested or casual) for a whale carcass being towed to shore and butchered would depend in part on the location of the beach to which the whale is brought. The whale

that was harvested in 1999 was brought to Neah Bay, where butchering and harvest-related ceremonies and celebrations were readily observable by numerous tribal members, local residents, protesters, enforcement personnel, and media representatives. Alternative locations where a whale carcass may be brought to shore and butchered would likely be along the Pacific coast portion of the Makah Reservation at sites that are far less prominent and accessible than Neah Bay. Under Alternative 4, which would allow whale hunting during the months of peak recreational use, there would be a greater potential for recreational users of such areas to encounter views of a whale carcass without actively seeking such views.

4.12.2.2 Media Viewers

As described in Subsection 3.12.3.3, Media Coverage of Previous Authorized Hunts, previous Makah whale hunts were the focus of intense coverage in local and regional newspapers, television broadcasts, and other media outlets. Stories and images of the hunt were also distributed nationwide and internationally. As with the previous hunts, media coverage would be expected to include images of hunt activities, protests, and public ceremonies and celebrations, as well as of a whale being struck, killed, brought to shore, and butchered.

The amount of media coverage would depend on the amount of hunt-related activity, which in turn would depend primarily on the number of days with hunt-related trips (including both hunting and scouting). It is possible that media coverage would be more intense for initial hunts, and would diminish as subsequent hunts occur. Even if that were to occur, alternatives that result in more days with hunt-related trips would still be likely to result in more media coverage overall.

4.12.3 Evaluation of Alternatives

The following subsections consider the potential for the alternatives to result in aesthetic effects on observers. For each alternative, the discussion addresses the potential number of on-scene observers who might view whale-hunting activities and the amount of media coverage.

The lowest risk of adverse aesthetic effects to casual observers would occur with the No-action Alternative, under which no whale hunts would be permitted. The No-action Alternative, however, would have adverse aesthetic effects on interested observers who desire to view a hunt. Under all of the action alternatives, interested observers could view a whale being hunted, towed to shore, or butchered from numerous points along the shoreline near Neah Bay and, to a lesser degree, the Pacific coast portion of the Makah U&A. Viewers not desiring to see a hunt, such as recreational users in the portions of the OCNMS, Olympic National Park, and Makah Reservation, may encounter views of

hunt-related activities without expecting to do so (Subsection 3.12.3.2, Vantage Points and Viewing Opportunities).

4.12.3.1 Alternative 1, No Action

Under the No-action Alternative, no whale hunt would be permitted and no whale hunting or associated activities (e.g., ceremonies, celebrations, protests, or law enforcement) would be anticipated. Therefore, there would be no potential to view hunt-related activities in the action area or through the media. With the possible exception of drift whales, no whale carcasses would be encountered by interested observers or recreational users of area beaches, trails, or campsites. Those desiring to view a hunt would not have the opportunity under this alternative.

4.12.3.2 Alternative 2, Tribe's Proposed Action

Under Alternative 2, whale hunts would likely occur on approximately 33 days from December through May, primarily during March through May. Hunts might be visible to observers at beaches and vantage points along the Pacific coast portion of the action area. Hunt-related activities would take place during the winter and spring when recreational use of these areas is typically lower than during the summer months. Compared to the No-action Alternative, Alternative 2 would result in an increased potential for persons in the action area to view (intentionally or unintentionally) a whale being hunted, towed to shore, or butchered. This increased potential would occur on approximately 33 days per year. The number of potentially affected casual observers would be limited by the timing of the hunt during periods of relatively low visitation.

As occurred in 1999 and 2000, whale hunts and associated activities (including protests and law enforcement) would likely receive extensive coverage in various media outlets. Such episodes of elevated media attention would be expected to occur on 60 days with hunt-related trips (including scouting) under Alternative 2. Public response would likely be substantial, expressing a wide range of opinions (Subsection 3.12.3.3, Media Coverage of Previous Authorized Hunts).

4.12.3.3 Alternative 3, Offshore Hunt

Under Alternative 3, whale hunts would likely occur on approximately 43 days (Subsection 4.1.3.1, Potential Timing of a Hunt and Number of Hunting Days [Alternative 3]). As under Alternative 2, hunt-related activities would take place during the winter and spring when recreational use of the action area is typically lower than during the summer months. In contrast to the other action alternatives, under Alternative 3, Makah hunters would be prohibited from making an initial strike on a gray whale within 5 miles (8 km) of shore. This would essentially eliminate the potential for persons at land-based vantage points in the action area to view a hunt, either intentionally or unintentionally. In addition, this restriction could limit the number of interested observers who seek to view the hunt from the water on

jet skis because jet skis may not have sufficient range for an offshore hunt. Compared to the No-action Alternative, Alternative 3 would therefore result in an increased potential for persons in the action area to view (intentionally or unintentionally) a whale being hunted, towed to shore, or butchered. This increased potential would occur on approximately 43 days per year. The area with this increased potential would likely be limited to Neah Bay or other locations where a harvested whale might be towed to shore and butchered.

Compared to Alternative 2, Alternative 3 would likely result in a similar number of days with hunt-related trips (60) and therefore the same opportunities for observers at beaches and vantage points along the Pacific coast portion of the action area to inadvertently view hunting activities located close to shore (e.g., scouting or towing a killed whale). Therefore, compared to the No-action Alternative, Alternative 3 would have a similar potential for observers to view some hunt activities as Alternative 2.

As occurred in 1999 and 2000, whale hunts and associated activities (including protests and law enforcement) would likely receive extensive coverage in various media outlets. As under Alternative 2, such episodes of elevated media attention would be expected to occur on 60 days with hunt-related trips. Public response to media coverage would likely be substantial, with a variety and intensity of response similar to that described in Subsection 3.12.3.3, Media Coverage of Previous Authorized Hunts. Because there would be the same number of days with hunt-related trips under Alternative 3 as under Alternative 2, Alternative 3 would likely result in a similar increase in the number of media broadcasts over the No-action Alternative compared to Alternative 2.

4.12.3.4 Alternative 4, Summer/Fall Hunt

Under Alternative 4, whale hunts would likely occur on approximately 7 days from June through November every other year. Hunts might be visible to observers at beaches and vantage points along the Pacific coast portion of the action area. In contrast to the other action alternatives, hunt-related activities under Alternative 4 would likely take place during summer when recreational use of these areas is typically at its peak. In addition, whale hunting would target PCFG whales that are feeding in the action area, and may therefore take place closer to shore than hunting that targets migrating whales further off shore. Compared to the No-action Alternative, Alternative 4 would result in an increased potential for persons in the action area to view (intentionally or unintentionally) a whale being hunted, towed to shore, or butchered. This increased potential would occur on approximately 7 days every other year.

Compared to the other action alternatives, Alternative 4 would likely result in fewer days of hunt-related trips (3.5 on average per year versus 22 to 60) and therefore fewer opportunities for observers at beaches and vantage points along the Pacific coast portion of the action area to view hunting activities.

However, the number of potential casual observers present in the action area on any given day of hunting would be greater under Alternative 4 than under Alternatives 2 and 3, because hunting would occur during the summer months when recreational use of the action area is higher. Alternative 4 would result in a smaller increase, relative to the No-action Alternative, in the number of opportunities for observers (interested or casual) to witness hunt-related activities but a greater potential for casual observers to inadvertently encounter sights of a whale being hunted, towed to shore, or butchered.

As occurred in 1999 and 2000, whale hunts and associated activities (including protests and law enforcement) would likely receive extensive coverage in various media outlets. Under Alternative 4, such episodes of elevated media attention would be expected to occur on 7 days every other year with hunt-related trips. Public response to media coverage would likely be substantial, with a variety and intensity of response similar to that described in Subsection 3.12.3.3, Media Coverage of Previous Authorized Hunts. Because there would be fewer days with hunt-related trips under Alternative 4 compared to Alternatives 2 and 3, Alternative 4 would likely result in a smaller increase in the number of media broadcasts over the No-action Alternative compared to Alternatives 2 and 3.

4.12.3.5 Alternative 5, Split-season Hunt

Under Alternative 5, hunting would likely occur during 3 weeks in December and 3 weeks in May, with a likely total of 11 days of hunting. Hunts might be visible to observers at beaches and vantage points along the Pacific coast portion of the action area. Compared to the No-action Alternative, Alternative 5 would result in an increased potential for persons in the action area to view (intentionally or unintentionally) a whale being hunted, towed to shore, or butchered. This increased potential would occur on approximately 11 days per year, although it could be as low as 0 days in years in which the hunt is on hiatus to allow the PCFG mortality limit to re-set at one whale.

Compared to Alternatives 2 and 3, Alternative 5 would likely result in fewer days of hunt-related trips, including scouting days (22 versus 60) and therefore fewer opportunities for observers at beaches and vantage points along the Pacific coast portion of the action area to view hunting activities. Alternative 5 would result in more days of hunt-related trips than Alternative 4 (22 versus 3.5 on average), but those days would occur during the winter and spring months when recreational use of the action area is comparatively low. Compared to the other action alternatives, therefore, Alternative 5 would likely result in a smaller increase, relative to the No-action Alternative, in the potential for casual observers to inadvertently encounter sights of a whale being hunted, towed to shore, or butchered.

As occurred in 1999 and 2000, whale hunts and associated activities (including protests and law enforcement) would likely receive extensive coverage in various media outlets. Under Alternative 5, such episodes of elevated media attention would be expected to occur on 22 days with hunt-related

trips. Public response to media coverage would likely be substantial, with a variety and intensity of response similar to that described in Subsection 3.12.3.3, Media Coverage of Previous Authorized Hunts. Because there would be fewer days with hunt-related trips under Alternative 5 compared to Alternatives 2 and 3, Alternative 5 would likely result in a smaller increase in media broadcasts than those alternatives, as compared to the No-action Alternative. Because there would be more days with hunt-related trips under Alternative 5 compared to Alternative 4, Alternative 5 would likely result in a greater increase in media broadcasts than Alternative 4, as compared to the No-action Alternative.

4.12.3.6 Alternative 6, Different Limits on Strikes and PCFG, and Limited Duration of Regulations and Permits

Under Alternative 6, the waiver and implementing regulations would lapse after 10 years, and it is not possible to predict whether they would be replaced with a new waiver and implementing regulations or what the terms of any new waiver and regulations would be. Therefore, the analysis for Alternative 6 considers effects only over a 10-year period.

Alternative 6 would include the same provisions as Alternative 2 for the timing and location of the hunt and would, therefore, be expected to result in the same number of days with hunting (33) and with hunt-related trips (i.e., 60 days of hunting or scouting). Compared to the No-action Alternative and Alternatives 4 and 5, therefore, Alternative 6 would result in an increased potential for persons in the action area to view (intentionally or unintentionally) a whale being hunted, towed to shore, or butchered. As under Alternatives 2 and 3, this increased potential would likely occur on approximately 33 days per year, primarily during winter and spring when recreational use of the action area is typically lower than during the summer months. Also as under Alternatives 2 and 3, episodes of elevated media attention would be expected to occur on 60 days with hunt-related trips. This represents a greater increase in media coverage than would be expected under Alternatives 4 and 5. Public response to media coverage would likely be substantial, with a variety and intensity of response similar to those described in Subsection 3.12.3.3, Media Coverage of Previous Authorized Hunts.

4.12.3.7 Alternative 7, Composite alternative – Preferred

Under Alternative 7, like Alternative 6, the waiver and implementing regulations would lapse after 10 years, and it is not possible to predict whether they would be replaced with a new waiver and implementing regulations or what the terms of any new waiver and regulations would be. Therefore, the analysis for Alternative 7 considers effects only over a 10-year period.

Alternative 7 would include the same provisions as Alternative 3 for timing and location for the hunt during winter/spring hunt seasons and would, therefore, be expected to result in the same number of days with hunting (33) and with hunt-related trips (i.e., 60 days of hunting or scouting), provided the

Tribe receives an ITA for WNP gray whales, allowing them to hunt from December through May. Compared to the No-action Alternative, Alternative 7 would result in an increased potential for persons in the action area to view (intentionally or unintentionally) a whale being hunted, towed to shore, or butchered. During winter/spring hunts, this increased potential would occur on approximately 33 days per year when recreational use of the action area is typically lower than during the summer months.

During summer/fall hunt seasons, whale hunts would likely occur on 7-14 days from July through October. Hunts might be visible to observers at beaches and vantage points along the Pacific coast portion of the action area. As with Alternative 4—but in contrast to most of the other action alternatives—hunt-related activities under Alternative 7 summer/fall hunts would likely take place during a period when recreational use of these areas is typically at its peak. In addition, whale hunting would target PCFG whales that are feeding in the action area and may, therefore, take place closer to shore than hunting that targets migrating whales further off shore. Compared to the No-action Alternative, Alternative 7 would result in an increased potential for persons in the action area to view (intentionally or unintentionally) a whale being hunted, towed to shore, or butchered. This increased potential would occur on approximately 7-14 days per year.

To compare the overall impact of Alternative 7 to the impacts of the other six alternatives, we use an annual average number of 37 days with hunt-related trips (300 winter/spring days plus 70 summer/fall days divided by the 10-year span of the waiver period). Alternative 7 would therefore result in lower potential for persons in the action area to view (intentionally or unintentionally) a whale being hunted, towed to shore, or butchered than Alternatives 2, 3, and 6 (each with 60 days of hunt-related trips). However, Alternative 7 would result in a potential than the No-action Alternative (0 days), as well as Alternatives 4 and 5 (7 every two years and 22 annual days of hunt-related trips, respectively), unless the Tribe does not receive authorization for any winter/spring hunts over the waiver period.

Implementing a low abundance threshold for the ENP stock may reduce the potential for aesthetic effects (both positive and negative). To compare the relative impacts of Sub-alternatives 7(a), 7(b), and 7(c) on aesthetics, we consider the relative likelihood of triggering the low-abundance threshold of each sub-alternative. Sub-alternative 7(c) carries the highest likelihood of reducing the number of authorized hunting years and, therefore, the annual average number of days with hunt-related trips over the waiver period. Sub-alternative 7(a), on the other hand, is most likely to allow hunting to occur during all 10 years of the proposed waiver period. As such, of the three sub-alternatives, 7(c) could result in the lowest potential for aesthetic effects while 7(a) could result in the greatest potential for aesthetic effects.

4.13 Transportation

4.13.1 Introduction

This subsection addresses the potential for a whale hunt and hunt-related activities in the action area to interfere with normal traffic patterns on highways, marine waters, and air routes near Neah Bay. In addition, the analysis addresses the potential for changes in traffic patterns to result in an increased risk of traffic accidents or to impede access by emergency services.

4.13.2 Evaluation Criteria

For this analysis, transportation resources in the action area are subdivided into three categories: land, water, and air. We used two criteria to determine the potential for effects on transportation under the alternatives. The first is the extent to which a particular alternative may affect traffic volumes or impede the movement of vehicles, vessels, or aircraft. Because each hunt would be expected to result in the same change in highway, marine, and air traffic volumes in the action area, the change in traffic would depend primarily on the amount of hunt-related activity. The amount of hunt-related activity would vary depending on the number of days with hunt-related trips. Table 4-1 identifies the anticipated number of days with hunt-related trips under each alternative and Subsection 4.1, Introduction, describes the rationale for those numbers.

The analysis also considers whether changes in traffic patterns under each alternative might result in an increased risk of traffic accidents or might impede access by emergency services. An alternative would be more likely to result in problems if it impeded or created a substantial increase in traffic during a time of year when volumes were higher than average. The following subsections describe the potential effects of each alternative on transportation, based on the extent and timing of traffic changes in each of the three transportation resource categories.

4.13.2.1 Highway Traffic

Based on experience with whale hunts in past years, it is unlikely that whale-hunt-related activities under the action alternatives would have a detectable effect on highway traffic volumes in the action area. For example, automated traffic count data for Highway 101 during the month of May 1999 (when the most recent successful hunt occurred) do not indicate any anomalous spikes in traffic volume during the days surrounding the hunt and subsequent events (Table 3-41).

As noted in Subsection 3.13.3.1.2, Vehicle Traffic Patterns During the 1999 Hunt, previous hunts affected highway traffic flow in the action area on one occasion when protesters and local police responding to them blocked traffic on State Route 112 for approximately 2.5 hours. The likelihood of a blockage occurring under the action alternatives cannot be predicted, but the potential for such an

occurrence would be expected to increase with the number of days with hunt-related activities. Table 4-1 identifies the anticipated number days with hunt-related activities under each alternative. The intensity of any roadway blockage would depend on the time of year during which it occurred. Therefore, hunts that occur during the peak travel season (June through September) (Figure 3-14) would affect more travelers and have a greater risk of impeding emergency vehicles compared to hunts during other times of year. Summer is also the period with the greatest number of visitors to the Makah Reservation (Subsection 3.13.3.1.1, Typical Vehicle Traffic Volume Patterns). A road blockage during summer would also be expected to have a greater impact on access to the reservation than a blockage at other times of year.

4.13.2.2 Marine Traffic

Accounts from previous hunts indicated that protesters operated approximately 15 vessels near hunt activities, including Neah Bay and Sekiu (Subsection 3.15.3.4, Behavior of People Associated with the Hunt). There were no reports of whale hunting or protest vessels hindering the passage of commercial or recreational fishing vessels, or of marine accidents associated with hunt-related traffic. The incident in 2000, in which a protester on a jet ski collided with a Coast Guard vessel enforcing the MEZ, was a direct result of the actions of the parties involved, rather than a byproduct of increased traffic volume.

Hunt-related activities would be unlikely to interfere with commercial shipping traffic because most (if not all) hunting would probably occur within the Coast Guard RNA, which lies almost entirely within the OCNMS area to be avoided. Commercial shipping traffic largely honors the area to be avoided (Subsection 3.6.3.1.4, Commercial Shipping) and would, therefore, be unlikely to encounter any hunt-related vessels.

The only area where commercial shipping traffic could reasonably be expected to encounter hunt-related marine traffic is in the Strait of Juan de Fuca because the area to be avoided does not extend eastward of Neah Bay on Cape Flattery. Because no hunting would be allowed in the Strait of Juan de Fuca, the potential for encounters between commercial shipping traffic and hunt-related vessels in the Strait of Juan de Fuca under any of the action alternatives would be very limited. Hunt-related marine traffic in the Strait of Juan de Fuca could consist of: (1) protest vessels, (2) enforcement vessels (3) hunting crews and support vessels transiting the approximately 9-mile (14.5-km) run between Neah Bay and coastal waters west of Cape Flattery, and (4) hunting crews and support vessels pursuing a harpooned whale travelling into the Strait of Juan de Fuca from the coastal hunt area. Protest or hunt-

related vessels traveling between Sekiu[19] and Neah Bay or Neah Bay and the open ocean would be unlikely to encounter commercial shipping traffic, however, because they would be expected to remain fairly close to shore (i.e., within 1 mile/1.6 km). Traffic lanes for commercial ships in the Strait of Juan de Fuca are generally 3 to 4 miles (4.8 to 6.4 km) from the northern shore of the Olympic Peninsula. The likelihood for protest- or hunt-related vessel traffic to interfere with commercial shipping traffic in the Strait of Juan de Fuca under any of the alternatives would therefore be very low, because most vessel traffic would be unlikely to occur in commercial shipping lanes. During the 1999 hunt, it took 8 minutes between the time the whale was harpooned and the fatal shot. Therefore, in the case that a harpooned whale is pursued into the Strait of Juan de Fuca, it is likely that any vessel interactions would be of very limited duration. Vessel traffic in areas south of the traffic lanes would have the potential to interfere with slow-moving vessels, such as small fishing vessels and tugs with barges, which are allowed to travel in waters south of the commercial traffic lanes. Any instances of interference would likely occur over a matter of minutes and would not be likely to have appreciable effects on the ability of slow-moving vessels to pass through the Strait of Juan de Fuca.

While it is possible that vessels engaged in hunts, protests, media coverage, or law enforcement could interfere with vessels entering or leaving Neah Bay, the likelihood of such interference occurring under the action alternatives cannot be predicted. The potential for interference or marine accidents would depend primarily on the number of days with hunt-related activities (Table 4-1). The potential for interference would also depend on the time of year that hunting occurs. As noted in Subsection 3.13.3.2, Marine Vessel Traffic, approximately 80 percent of all boat trips (commercial and recreational) from Neah Bay occur during the months of May through August. Approximately 6 percent of all trips occur during the 5-month period from November through March, and 6 percent occur during April. Hunt-related activities that occur during the summer peak period for marine traffic would have a greater potential to affect commercial or recreational fishing vessel traffic, compared to activities at other times of year. Recreational and commercial fishing vessel landings from Neah Bay have decreased precipitously in recent years (which was exacerbated by the COVID-19 pandemic) (Table 3-42). However, data from 2022 suggests landings could increase to pre-pandemic levels in the coming years. If the number of boat trips related to recreational and commercial fishing vessel landings continues to increase to pre-pandemic levels (Table 3-42), the likelihood of hunt-related vessel traffic interfering with other marine traffic (particularly recreational fishing trips) would likewise be expected

[19] During the hunts that took place in 1998 and 1999, several protest vessels moored in Sekiu, approximately 20 miles (32.2 km) east of Cape Flattery in the Strait of Juan de Fuca.

to increase relative to the last three years but decrease (or stay constant) relative to the entire time series assessed in Table 3-42.

4.13.2.3 Air Traffic

There is no indication from accounts of previous hunts that law enforcement or media aircraft interfered with air traffic in the action area. The likelihood of such interference occurring under the action alternatives cannot be predicted, but the potential would be expected to increase each time a hunt-related trip occurs. Hunt-related activities that occur during a peak period for aircraft use would have a greater potential to affect air traffic, compared to activities at other times of year. No data are readily available to quantify seasonal differences in air traffic in the action area, but the peak period of aircraft use likely coincides with the summer months when conditions of low wind and good visibility are relatively common.

4.13.3 Evaluation of Alternatives

The following subsections consider the potential for the alternatives to affect transportation in the action area. For each alternative, the discussion addresses the anticipated increases in the volume or patterns of highway, marine, and air traffic in the action area, as well as changes in the risk of traffic accidents and the potential for highway blockages to interfere with emergency vehicles. The lowest risk of adverse effects on transportation would occur with the No-action Alternative, under which no whale hunts would be permitted and traffic volumes and patterns on highways, marine waters, and air routes near Neah Bay would not be expected to differ from their current levels. Under all of the action alternatives, elevated levels of marine and air traffic associated with whale hunts would have the potential to interfere with normal traffic patterns and could result in an increased risk of accidents relative to the No-action Alternative. Although none of the alternatives would be likely to increase the volume of highway traffic, it is possible there could be road blockages associated with protests and ensuing law enforcement responses, creating the possibility of traffic accidents or impediments to access by emergency services.

During each hunt, there would be an increased likelihood, relative to the No-action Alternative, that protests and/or ensuing law enforcement responses could result in highway blockages; vessels involved in the hunt, protests, media coverage, and law enforcement could interfere with fishing or shipping traffic; or aircraft involved in law enforcement or media coverage could interfere with other air traffic in the action area. The number of occasions on which this potential would exceed conditions under the No-action Alternative would correspond to the number of days on which hunt-related trips would occur under a particular alternative.

The risk of adverse effects on transportation would also be related to the time of year in which whale hunting takes place. Alternatives that allow whale hunting during summer months would be more likely to affect commercial and recreational fishing boat trips from Neah Bay. Similarly, changes in traffic patterns as a result of highway blockages could have a greater effect during summer months when traffic volumes are typically higher.

4.13.3.1 Alternative 1, No Action

Under the No-action Alternative, no whale hunt would be permitted and no whale hunting or associated activities (e.g., protests, law enforcement, or media coverage) would be expected to occur. Traffic volumes in the action area would not be expected to differ from current levels. There would be no potential for hunt-related activities to interfere with highway, marine, or air traffic or to result in an elevated risk of accidents or impede access by emergency vehicles.

4.13.3.2 Alternative 2, Tribe's Proposed Action

Under Alternative 2, hunt-related trips would be expected to occur on approximately 60 days from December through May, primarily during April and May. Compared to the No-action Alternative, increased vessel and air traffic associated with whale hunts under Alternative 2 would result in an increased potential for interference with marine or air traffic in the action area and, possibly, an increased risk of accidents. Potential highway blockage resulting from protest activities and law enforcement response could result in traffic accidents or impediments to emergency vehicles. During each day with hunt-related activities, there would be an increased likelihood (relative to the No-action Alternative) that protests and/or ensuing law enforcement responses could result in highway blockages; vessels involved in the hunt, protests, media, and law enforcement could interfere with fishing or shipping traffic; or aircraft involved in law enforcement or media coverage could interfere with other air traffic in the action area. These risks would occur on approximately 60 days per year, most likely during April and May, compared to no occurrences under the No-action Alternative.

Because whale hunting under Alternative 2 would be limited to the winter and early spring months, it would not overlap the peak periods for highway and air traffic. If most hunts take place during April and May, they would overlap the period during which there is a high volume of marine vessel traffic, particularly for recreational fishing in May. More boat trips from Neah Bay occur during the months of June through August (combined) compared to May, however (Figure 3-16).

4.13.3.3 Alternative 3, Offshore Hunt

Alternative 3 would include the same hunting season as Alternative 2 and would, therefore, result in the same increased potential, compared to the No-action Alternative, for interference with marine or air traffic in the action area and risk of highway traffic accidents or impediments to emergency vehicles.

During each day with hunt-related activities, there would be an increased likelihood (relative to the No-action Alternative) that protests and/or ensuing law enforcement responses could result in highway blockages; vessels involved in the hunt, protests, media coverage, and law enforcement could interfere with fishing or shipping traffic; or aircraft involved in law enforcement or media coverage could interfere with other air traffic in the action area. These risks would occur on approximately 60 days from December through May (most likely throughout the year).

Hunting would take place farther off shore under Alternative 3 than under the other action alternatives because Makah hunters would be prohibited from making an initial strike on a gray whale within 5 miles (8 km) of shore. This would not be likely to affect the potential for interference with commercial shipping traffic, however, because most of the OCNMS area to be avoided extends more than 20 miles (32.2 km) off shore, and safety considerations and logistical constraints would likely keep hunting vessels as close as possible to the 5-mile (8-km) limit.

4.13.3.4 Alternative 4, Summer/Fall Hunt

Under Alternative 4, the hunting season would extend from June 1 through November 30 instead of December through May. Based on the expectation that locating and striking a known ENP male would take no more than 7 days (Subsection 4.1.4, Alternative 4), hunt-related trips under Alternative 4 would be likely to occur on approximately 7 days every other year. Compared to the No-action Alternative, therefore, Alternative 4 would result in an increased potential for interference with marine or air traffic in the action area and increased risk of highway traffic accidents or impediments to emergency vehicles on approximately 7 days every other year. Compared to the other action alternatives, this increased potential would occur on fewer days per year (3.5 on average versus 22 to 60 annually).

Hunting activities under Alternative 4 would likely take place during the summer, when highway, vessel, and air traffic are highest. Whale hunts during the summer months would thus have a greater potential to affect traffic compared to activities at other times of year. Compared to the other action alternatives, therefore, Alternative 4 would result in a smaller increase, relative to the No-action Alternative, in the number of occasions on which hunt-related activities could increase the potential for interference with highway, vessel, and air traffic, but a greater potential for each occasion to result in interference (though less than Alternative 7; see Subsection 4.6.3.7, Alternative 7, Composite alternative).

4.13.3.5 Alternative 5, Split-season Hunt

Under Alternative 5, the hunting season would be limited to 3 weeks in December and 3 weeks in May, in contrast to the 6-month-long hunting seasons under the other action alternatives. In addition, the landing of a single PCFG whale, or the striking and losing of a single whale, would end the hunt for any given

year. Based on the length of the hunting season, Alternative 5 would likely result in approximately 22 days per year with hunt-related trips. This could decrease to 0 days in years in which the hunt is on hiatus to allow the PCFG mortality limit to re-set at one whale. Compared to the No-action Alternative (under which there would be no hunt-related vessel traffic), Alternative 5 would therefore result in an increased potential for interference with marine or air traffic in the action area and increased risk of highway traffic accidents or impediments to emergency vehicles on approximately 22 days per year. Compared to Alternatives 2 and 3, this increased potential would occur on fewer days per year (22 versus 60). Compared to Alternative 4, this increased potential would occur on more days per year (22 annually versus 7 every other year).

The increased potential for interference, accidents, or impediments would be limited to the months of December and May (more likely during May), outside of the peak periods for highway and air traffic. As under Alternatives 2 and 3, hunt-related trips during May would have a higher potential for interference with recreational fishing vessel traffic than trips during December.

4.13.3.6 Alternative 6, Different Limits on Strikes and PCFG, and Limited Duration of Regulations and Permits

Under Alternative 6, the waiver and implementing regulations would lapse after 10 years, and it is not possible to predict whether they would be replaced with a new waiver and implementing regulations or what the terms of any new waiver and regulations would be. Therefore, the analysis for Alternative 6 considers effects only over a 10-year period.

Alternative 6 would be expected to result in the same number of days with hunt-related trips (60) as Alternative 2 and would include the same restrictions on hunting area and season. Thus, the increased potential for interference with marine or air traffic in the action area and risk of highway traffic accidents or impediments to emergency vehicles would be the same as under Alternatives 2 and 3, compared to the No-action Alternative. This increased potential and risk is greater under Alternative 6 as compared to Alternatives 4 and 5 with 0 to 22 days of hunt-related activities.

4.13.3.7 Alternative 7, Composite alternative – Preferred

Under Alternative 7, like Alternative 6, the waiver and implementing regulations would lapse after 10 years, and it is not possible to predict whether they would be replaced with a new waiver and implementing regulations or what the terms of any new waiver and regulations would be. Therefore, the analysis for Alternative 7 considers effects only over a 10-year period.

During winter/spring hunt seasons, whale hunts would likely occur on approximately 60 days from December through May, provided the Tribe receives an ITA for WNP gray whales, allowing them to hunt in those months. These hunts would not overlap the peak periods for highway and air traffic. If

most hunts take place during April and May, they would overlap the period during which there is a high volume of marine vessel traffic, particularly for recreational fishing in May. During summer/fall hunt seasons, an estimated 7-14 days with hunt-related trips would occur when highway, vessel, and air traffic are highest. Whale hunts during the summer and fall months would thus have a greater potential to affect traffic, especially commercial and recreational fishing traffic, compared to activities at other times of year.

To compare the overall impact of Alternative 7 to the impacts of the other six alternatives, we use an annual average number (based on the 10-year span of the waiver period) of 37 days with hunt-related trips. The increased potential for effects on traffic would be less under Alternative 7 than Alternatives 2, 3, and 6, each with 60 days of hunt-related trips. However, Alternative 7 would result in greater impacts on traffic than the No-action Alternative (0 days), as well as Alternatives 4 and 5 with 0 to 22 days of hunt-related trips per year, unless the Tribe does not receive authorization for any winter/spring hunts over the waiver period.

Implementing a low abundance threshold for the ENP stock may reduce the impacts of the hunt on transportation by reducing the number of authorized hunting years, should the selected threshold be triggered. As the highest threshold, Sub-alternative 7(c) carries the highest likelihood of being triggered and reducing the number of authorized hunting years and, therefore, the annual average number of days with hunt-related trips over the waiver period. Sub-alternative 7(a), on the other hand, is most likely to allow hunting to occur during all 10 years of the proposed waiver period. As such, of the three sub-alternatives, 7(c) could result in the lowest potential impact to transportation resources while 7(a) could result in the greatest potential impact.

4.14 Public Services

4.14.1 Introduction

This subsection addresses the potential for the alternatives to affect public services in the action area. This subsection analyzes the potential for a whale hunt and hunt-related activities to impede the ability of law enforcement to maintain order, and medical professionals and facilities to treat injuries. Subsection 4.13, Transportation, discusses the potential for the alternatives to have transportation-related effects on access by emergency vehicles.

4.14.2 Evaluation Criteria

We used two criteria to determine the potential for effects on public services under the alternatives. The first is the anticipated number of events requiring the attention of law enforcement personnel, and the second is the anticipated number of events requiring the attention of medical personnel.

4.14.2.1 Law Enforcement

Activities by protesters or counter-protesters could result in conflicts or legal infractions that would require intervention by law enforcement agents at sea or on land. A sudden, unanticipated increase in the number or frequency of such incidents could overwhelm the ability of local law enforcement personnel or facilities to respond. Even if such an occurrence were prevented through careful planning and coordination, hunt-related incidents could divert law enforcement resources from other missions. An increase in traffic incidents requiring law enforcement intervention could also divert law enforcement resources from other missions. Subsection 4.13.3, Evaluation of Alternatives [Transportation], also evaluates the potential for the alternatives to result in changes in traffic incidents, which could require law enforcement intervention or medical response.

As with the previous hunts, a law enforcement task force (Subsection 3.14.3.2, Police) would likely be assembled to ensure public safety during any whale hunts permitted under the action alternatives. We evaluated the enforcement response during the previous hunts in 1999 and 2000 and made inquiries with various non-tribal enforcement agencies. Based on that information, we expect that the following entities would likely commit resources to any future whale hunt: U.S. Coast Guard, National Marine Fisheries Service, Washington Fish and Wildlife Police, and Clallam County Sheriff. The task force would coordinate county, state, federal, and tribal authorities' efforts to address any potential public disturbances related to whale hunts. Planning undertaken by the previous whale hunt task force included logistics (including assuring the availability of adequate staffing, equipment, and facilities), communications, interagency cooperation, crowd control, and establishment of incident command systems. Similar planning would most likely precede any whale hunts under the action alternatives, reducing the potential for hunt-related incidents to overwhelm law enforcement personnel or facilities.

As noted in Subsection 3.14.3.2, Police, the Clallam County Sheriff's Office did not find that the previous hunts and associated activities imposed a substantial burden on staff. The reported increase in traffic stops by the Washington State Patrol on State Route 112 in 1999 could have been related to the Makah whale hunt, but it is not possible to determine from the available data whether that increase occurred before, during, or after the period of the whale hunt. There is no evidence of an increase in traffic volumes or the number of collisions on action area highways during the years in which previous hunts or practice exercises took place (Subsection 4.13.2.1, Highway Traffic [Evaluation Criteria]). Because there is no clear indication of an increase in traffic stops or collisions as a result of previous hunting activities, it is reasonable to conclude there would be no substantial increases in these rates in the action area under any of the alternatives.

During the previous Makah whale practice exercise in 1998 and hunts in 1999 and 2000, U.S. Coast Guard personnel were responsible for ensuring the safety of persons and vessels near the hunt, which included enforcing the MEZ around Makah whale hunt vessels. The Coast Guard used helicopters, a cutter, and several utility boats and Zodiacs. They issued citations for negligent vessel operations, MMPA take violations, and violations of the MEZ (Subsection 3.14.3.1, Coast Guard). The Coast Guard would likely resume these activities under any of the action alternatives. In addition to participating in law enforcement activities, the Coast Guard would likely be the first to respond to any incidents requiring search and rescue in marine waters, for example, if a vessel capsized because of inclement weather or a collision. The risk of such events occurring would probably be greater under alternatives that restricted whale hunting to winter and spring (i.e., Alternatives 2, 3, 5, and 6), when adverse weather and sea conditions would more likely occur (Subsection 4.15.2.2, Injury from Boating Accidents). As noted in Subsection 3.14.3.1, Coast Guard, most search and rescue cases occur during the summer months when sports fishers and tourists are present in greatest numbers. Therefore, under alternatives in which Makah tribal members could hunt during summer (i.e., Alternative 4), there would be a greater potential for a hunt-related boating incident to occur simultaneously with another incident requiring Coast Guard attention.

The potential for incidents requiring a law enforcement response would likely be similar for all hunt-related activities. The risk of hunt-related incidents leading to law enforcement responses that overwhelmed the ability of local law enforcement personnel or facilities to respond would thus depend on the number of days with hunt-related trips. The severity of the effect on public services could vary according to the time of year the hunts occur. If law enforcement is diverted during periods when demand might be higher (such as during the busier summer season), the consequences of the diversion could be greater.

4.14.2.2 Medical Facilities

As noted in Subsection 4.15 (Public Safety), hunt-related activities might result in injuries from boating accidents, mishaps with weapons, violence associated with protests, or possible traffic accidents. A sudden influx of persons requiring medical attention could exceed the physical or technical capacities of tribal and other local public health facilities. Additional trauma care facilities are available nearby. They include a Level 3 trauma care facility in Port Angeles and a Level 1-2 facility in Seattle. During the spring 2000 hunt, one protester sustained a shoulder injury and was transported to Port Angeles for medical care (Subsection 3.15.3.4, Behavior of People Associated with the Hunt).

The potential for injuries requiring medical attention would likely be similar for all hunt-related activities, though hunt-related trips during inclement weather and further from shore might increase the

risk of boating accidents for both protesters and hunters (Subsection 4.15.2.2, Injury from Boating Accidents). The risk of injury associated with any given alternative would, therefore, depend on the number of days with hunt-related trips, restrictions on the location of the hunt (i.e., distance from shore), and seasonal restrictions on hunting (that is, the ability of the Tribe to hunt during summer and therefore choose hunting opportunities with better weather conditions).

4.14.3 Evaluation of Alternatives

The following subsections consider the potential for the alternatives to affect public services in the action area. For each alternative, the discussion addresses the anticipated change in the number of incidents requiring law enforcement intervention and injuries requiring medical attention.

The lowest risk of adverse effects on public services would occur under the No-action Alternative because no whale hunts would be permitted and the need for law enforcement and medical attention in the action area would not be expected to differ from current levels. Under all of the action alternatives, protests and other activities associated with whale hunts would have the potential to divert law enforcement resources from other missions. Hunt-related activities could also result in an increase in the number of injuries and exceed the capabilities of local health facilities. The greatest increases in the potential for such occurrences would occur under Alternatives 2, 3, and 6, under which hunt-related trips would occur on approximately 60 days per year. Hunting under these alternatives would be limited, however, to periods when the number of recreational visitors in the action area is comparatively low, reducing the likelihood that hunt-related incidents might occur when public services resources were engaged elsewhere. On the other hand, vessels engaged in hunt-related trips during winter and spring months under these alternatives would face an elevated risk (compared to during the summer months) of encountering unanticipated storms and capsizing, resulting in injuries.

The increased potential for diversion of law enforcement resources or the occurrence of injuries that exceed the capabilities of local health facilities would be less under Alternatives 5 and 7 than under Alternatives 2, 3, and 6 because hunt-related trips would occur on approximately 22 days and 37 days, on average. Some of the hunting under Alternative 7 would occur during the summer months, however, when the risk of vessels capsizing in unanticipated storms would be reduced compared to the other action alternatives. Summer hunts would, however, occur during a comparatively busy time of year when law enforcement and medical services are more likely to be engaged elsewhere. The increased risk would be even less under Alternative 4, under which hunt-related trips would likely occur on only 7 days every other year. In addition, hunt-related trips under Alternative 4 could be conducted only during the summer months.

4.14.3.1 Alternative 1, No Action

Under the No-action Alternative, no whale hunt would be permitted and no whale hunting or associated activities (e.g., protests or law enforcement) would be expected to occur. The need for law enforcement and medical services in the action area would probably not differ from current levels. There would be no potential for injuries or incidents associated with hunt-related activities to overwhelm personnel and facilities or divert resources away from other duties. As under current scenarios, any persons who sustained injuries unrelated to hunt activities exceeding the physical or technical capacities of local public health facilities could be transported to other facilities in the region.

4.14.3.2 Alternative 2, Tribe's Proposed Action

Whale hunts and related activities under Alternative 2 would result in an increased potential for diversion of law enforcement resources or the occurrence of injuries that exceed the capabilities of local health facilities compared to the No-action Alternative. As discussed in Subsection 4.14.2, Evaluation Criteria, the potential for these effects would depend on the number of days with hunt-related trips, as well as the time of year the hunts occur. As described in Subsection 4.1, Introduction, there would likely be approximately 60 days with hunt-related trips per year under Alternative 2. Hunt-related activities would be limited to the period from December through May and would be expected to occur primarily during April and May. If a law enforcement task force were implemented, similar to previous hunts, protests or other activities would probably not overwhelm the combined personnel and facilities of county, state, federal, and tribal authorities based on the size of the protest activities experience in the 1999/2000 hunts.

Similarly, Alternative 2 could result in injuries requiring medical assistance during approximately 60 days with hunt-related trips. The increased risk of injuries compared to the No-action Alternative could result in an increased risk of exceeding the capabilities of local health facilities. Whale hunting would be limited to the winter and early spring months, outside the period when most search and rescue cases typically occur but also during a period when weather and sea conditions are more likely to contribute to boating accidents. If hunt-related activities resulted in injuries that exceeded the physical or technical capacities of local public health facilities, persons requiring medical attention could be transported to other facilities in the region.

4.14.3.3 Alternative 3, Offshore Hunt

Alternative 3 would include the same hunting season as Alternative 2 and would, therefore, result in the same increased potential, compared to the No-action Alternative, for diversion of law enforcement resources or the occurrence of injuries that exceed the capabilities of local health facilities. This increased potential would occur on approximately 60 days from December through May (most likely

during April and May). As under Alternative 2, if a law enforcement task force were implemented, similar to previous hunts, protests or other activities would probably not overwhelm the combined personnel and facilities of county, state, federal, and tribal authorities.

Hunting would take place farther off shore under Alternative 3 than under the other action alternatives because Makah hunters would be prohibited from making an initial strike on a gray whale within 5 miles (8 km) of shore. This restriction might result in a decreased need for law enforcement response during hunt-related trips compared to the other action alternatives because of the range limitations of some vessels (e.g., jet skis) used by protesters. If fewer people are able to participate near vessels engaged in hunting, there may be fewer situations that result in the issuance of citations for negligent vessel operations, MMPA take violations, or violations of the MEZ.

Alternative 3 could result in injuries requiring medical assistance during approximately 60 days with hunt-related trips, similar to Alternative 2. The increased risk of injuries compared to the No-action Alternative could result in an increased risk of exceeding the capabilities of local health facilities. Whale hunting would be limited to the winter and early spring months, outside the period when most search and rescue cases typically occur but also during a period when weather and sea conditions are more likely to contribute to boating accidents. In addition, hunt-related trips that occur farther off shore would have a greater potential to encounter rough seas, possibly increasing the risk of boating accidents and the need for medical attention compared to the other action alternatives. If hunt-related activities resulted in injuries that exceeded the physical or technical capacities of local public health facilities, persons requiring medical attention could be transported to other facilities in the region.

4.14.3.4 Alternative 4, Summer/Fall Hunt

Under Alternative 4, the hunting season would extend from June 1 through November 30 instead of December through May. Based on the expectation that locating and striking a known ENP male whale would take no more than 7 days (Subsection 4.1.4, Alternative 4), hunt-related trips under Alternative 4 would be likely to occur on approximately 7 days every other year. Compared to the No-action Alternative, therefore, Alternative 4 would result in an increased potential for diversion of law enforcement resources or the occurrence of injuries that exceed the capabilities of local health facilities. This increased potential would occur on an average of 3.5 days per year (y days every other year), which is less than under any of the other action alternatives.

Hunting under Alternative 4 would likely take place during the summer when the need for law enforcement resources is generally higher and the potential for conflict between hunt-related law enforcement needs and other law enforcement needs would be higher. As under Alternatives 2 and 3, however, implementation of a law enforcement task force would minimize the potential for protests or

other activities to overwhelm the combined personnel and facilities of county, state, federal, and tribal authorities. In addition, hunt-related trips during summer would be less likely to encounter weather and sea conditions that contribute to boating accidents, reducing the potential for any given trip to result in the need for search and rescue operations or medical attention of injured persons.

4.14.3.5 Alternative 5, Split-season Hunt

Under Alternative 5, the hunting season would be 3 weeks in December and 3 weeks in May, in contrast to the 6-month-long hunting seasons under the other action alternatives. In addition, the landing of a single PCFG whale or the striking and losing of a single whale would end the hunt for any given year. Based on the length of the hunting season, Alternative 5 would likely result in approximately 22 days per year with hunt-related trips. This could decrease to 0 days in years in which the hunt is on hiatus to allow the PCFG mortality limit to re-set at one whale.

Compared to the No-action Alternative, therefore, Alternative 5 would result in an increased potential for diversion of law enforcement resources or the occurrence of injuries that exceed the capabilities of local health facilities. This increased potential would occur on approximately 22 days per year. Compared to Alternatives 2, 3, and 6, this increased potential would occur on fewer days per year (22 versus 60). Compared to Alternative 4, this increased potential would occur on more days per year (22 versus 7 every other year). However, there would be no increase in potential in years in which the hunt is on hiatus. If a law enforcement task force were implemented, similar to previous hunts, protests or other activities would probably not overwhelm the combined personnel and facilities of county, state, federal, and tribal authorities. The increased risk of injuries compared to the No-action Alternative could result in an increased risk of exceeding the capabilities of local health facilities but is unlikely to do so for the reasons identified above.

4.14.3.6 Alternative 6, Different Limits on Strikes and PCFG, and Limited Duration of Regulations and Permits

Under Alternative 6, the waiver and implementing regulations would lapse after 10 years. Therefore, the analysis for Alternative 6 considers effects over a 10-year period.

Alternative 6 would be expected to result in the same number of days with hunt-related trips (60) as Alternative 2 and would include the same restrictions on hunting area and season. Thus, the increased potential for diversion of law enforcement resources or the occurrence of injuries that exceed the capabilities of local health facilities would be the same as under Alternative 2 compared to the No-action Alternative.

4.14.3.7 Alternative 7, Composite Alternative—Preferred

Under Alternative 7, like Alternative 6, the waiver and implementing regulations would lapse after 10 years. Therefore, the analysis for Alternative 7 considers effects over a 10-year period.

As with the other action alternatives, Alternative 7 would increase the risk of adverse effects to public services compared to the No-action Alternative. During winter/spring hunt seasons, an estimated 60 days of hunt-related trips would occur during a period when vessels engaged in hunt-related trips would face an elevated risk of encountering unanticipated storms and capsizing, resulting in injuries. During summer/fall hunt seasons, an estimated 7-14 days with hunt-related trips would occur during a period when more favorable ocean conditions would lessen the risk of such accidents and injuries. During winter/spring hunts, inclement weather would result in comparatively fewer recreational visitors in the action area, reducing the likelihood that hunt-related incidents might occur when public services resources were engaged elsewhere. Summer/fall hunts would, however, occur during a comparatively busy time of year when law enforcement and medical services are more likely to be engaged elsewhere. As under Alternatives 2 and 3, however, implementation of a law enforcement task force would minimize the potential for protests or other activities to overwhelm the combined personnel and facilities of county, state, federal, and tribal authorities.

To compare the overall impact of Alternative 7 to the impacts of the other six alternatives, we use an annual average number (based on the 10-year span of the waiver period) of 37 days with hunt-related trips. The increased potential for diversion of law enforcement resources or the occurrence of injuries that exceed the capabilities of local health facilities would be less under Alternative 7 than Alternatives 2, 3, and 6, each with 60 days of hunt-related trips. However, Alternative 7 would result in greater impacts on public services than the No-action Alternative (0 days), as well as Alternatives 4 and 5 with an average of 3.5 and 22 days of hunt-related trips, respectively, unless the Tribe does not receive authorization for any winter/spring hunts over the waiver period.

Implementing a low abundance threshold for the ENP stock may reduce adverse effects to public services under Alternative 7. To compare the relative impacts of Sub-alternatives 7(a), 7(b), and 7(c) on public services, we consider the relative likelihood of triggering the low-abundance threshold of each sub-alternative. Sub-alternative 7(c) carries the highest likelihood of reducing the number of authorized hunting years and, therefore, the annual average number of days with hunt-related trips over the waiver period. Sub-alternative 7(a), on the other hand, is most likely to allow hunting to occur during all 10 years of the proposed waiver period. As such, of the three sub-alternatives, 7(c) could result in the lowest potential impact to public services while 7(a) could result in the greatest potential impact.

4.15 Public Safety

4.15.1 Introduction

This subsection addresses the potential for a whale hunt and hunt-related activities in the action area to affect public safety. Persons whose safety may be affected by whale-hunt-related activities are divided into three groups: hunters and other participants (such as official observers, members of the media, and law enforcement personnel), protesters, and bystanders. Bystanders on the water may include recreational and other boaters; bystanders on land may include Makah tribal members at protests, tourists, or motorists. Individuals from any of these groups could be injured by weapons, boating accidents, or protests and related activities (such as civil disobedience or law enforcement actions). This subsection examines how the potential for those types of injuries might vary depending on the time of year and location of any hunt and on the frequency of any hunting.

4.15.2 Evaluation Criteria

We used three criteria to determine the potential for effects on public safety under the alternatives, based on the ways in which injury may occur as a result of any proposed gray whale hunt. These include injuries from weapons (harpoon, rifle, or explosive grenade), from boating accidents (including those associated with protest activities on the water), or from land-based protest activities.

With the exception of injuries related to adverse weather or sea conditions, the risk of injury would likely be equal for each hunt attempt. The risk of injury associated with any given alternative would, therefore, depend on the harvest limit, the number of days of hunting, the time of year the hunts occur, and the location of the hunt. Table 4-1 identifies the expected number of days of hunting and hunt-related trips under each alternative. Alternatives under which more hunts would occur would probably result in greater risk of injury to hunters, protesters, and bystanders. Alternatives that limit hunting to the winter and spring period would probably result in different levels of risk of injury than an alternative that allowed hunting during the summer (e.g., Alternative 4), depending upon the group involved and the type of injury considered. The following subsections discuss the risk of each type of injury for each of the groups that may be affected.

4.15.2.1 Injury from Weapons

Under the No-action Alternative, no whale hunting is authorized and no weapons are used in the action area to kill whales. Some level of hunting currently exists (e.g., for deer and elk), but the number of injuries associated with weapons accidents in hunting is unknown. Under any of the action alternatives, hunters and other participants would be at the greatest risk of injury from weapons because they would be handling weapons, while protesters and bystanders would experience a lesser risk. The possibility of

any person being struck by a bullet or shoulder-fired explosive projectile would be minimized by proposed safety requirements that would include, among other things, the U.S. Coast Guard navigational restrictions (Subsection 3.1.1.3, Coast Guard Regulated Navigation Area), hunter training, visibility requirements, and a lookout to determine when the shooter would have a clear line of fire at a whale (Subsection 2.3.2.2.12, Other Environmental Protection Measures). In addition, the offshore hunt area under Alternative 3 would mitigate the risk of bullets injuring persons on shore (although hunters and other participants would still be at risk as in the other action alternatives).

The risk of injury to any group of individuals from weapons would depend on several factors. One is the number of whales that could be struck and the number of whales that could be harvested, which in turn would affect the number of shots fired or grenades launched. Table 4-1 identifies the number of whales that may be struck and the number of shots fired or grenades launched under each alternative. The risk of injury would also depend on the season during which hunting occurs. Hunts that take place during the winter and spring months may have a greater potential to result in injury from weapons than hunts that occur during the summer. This is because the limited hunting season would include periods of rougher weather and sea conditions, which might hamper the accuracy of hunters using harpoons, rifles, or explosive projectiles. Less accurate strikes might result in greater risk of injury to hunt participants, protesters, and bystanders. The risk of injury from weapons may also be affected by the location of the hunt. Hunts that take place in waters more than 5 miles (8 km) off shore (as under Alternative 3) would have an elevated potential of encountering rough seas, possibly hampering the accuracy of hunters but also essentially eliminating the risk of stray projectiles striking bystanders on land.

Hunters and Other Participants

Hunters using a toggle-point harpoon could be cut by the harpoon tip or struck with the shaft. Hunters using either a harpoon or an explosive projectile as the primary weapon for striking the whale could become tangled in the line. Hunters using an explosive projectile either as the primary or secondary hunting weapon (launched either from a darting gun or shoulder gun) could be injured if the grenade exploded prematurely. There would be a greater risk with black powder grenades, where the fuse would be lit before the grenade was fired (Subsection 3.15.3.5.2, Weapons Associated with the Hunt). The fuse on penthrite grenades would not be lit until the projectile entered the whale, reducing the risk of hunter injury from premature detonation (Subsection 3.15.3.5.2, Weapons Associated with the Hunt). Hunters using a rifle as the secondary weapon for killing a whale could potentially be injured from the rifle recoiling or misfiring; hunters could also be struck directly or by ricochet with a .50 caliber bullet.

Weapons also present the potential for injury to other participants, such as members of the media, hunt observers, and enforcement officials. Such individuals could be exposed to many of the same potential injuries from weapons as hunters, but they would be less likely to be injured by a harpoon, premature detonation of grenades, or rifle recoil. Such injuries are more likely to be associated with handling a weapon.

Protesters

Protesters would face a lower risk than hunters of being injured by weapons misfiring because protesters would not likely be handling weapons. Records of the 1999 and 2000 protests do not show that protesters possessed weapons. Protesters could be struck by an errant harpoon, bullet, or explosive projectile, and protesters who attempt to interfere with a hunt by positioning their vessels between whales and hunters would be more likely to be struck by a projectile. Protesters might also sustain injuries if their vessels were struck by a projectile.

Bystanders

Recreational boaters and other potential bystanders would probably not encounter hunting activities under the action alternatives because of the large size of the hunting area, its remoteness, and the presence of the Coast Guard MEZ. Any recreational boaters who encountered hunting activities would likely avoid them. Because they would probably not be near the hunt, bystanders on the water would most likely not be injured by weapons. It is extremely unlikely that bystanders on land would be exposed to injury from weapons under the action alternatives because any hunt would probably occur hundreds to thousands of yards (meters) from shore and tribal hunters would adhere to weapon discharge procedures (e.g., visibility and shot distances) expected to constrain the area of potential danger to the immediate vicinity of the whale being pursued (Beattie 2001; Graves et al. 2004; Makah Tribe 2005). There is nevertheless a remote possibility (intended to be extremely remote under Alternative 3) that a bystander on shore could be struck by a .50 caliber bullet, which has a range of up to 5 miles (8 km).

4.15.2.2 Injury from Boating Accidents

Under the No-action Alternative, no whale hunts are authorized and no vessel activity associated with whale hunts would occur. There is a considerable amount of commercial and recreational vessel activity in the area, some of which results in boating accidents and injuries. The U.S. Coast Guard responds to approximately 100 search and rescue cases each year (Subsection 3.14.3.1, Coast Guard). The number of injuries associated with these incidents is not known. Under any of the action alternatives, boating accidents might result from protest activities on the water, the actions of a wounded whale, or adverse weather and sea conditions. Any type of boating accident could result in

traumatic injury, drowning, or hypothermia. The risk of individuals being injured in a boating accident associated with protester activities would be reduced by the Coast Guard navigational restrictions (Subsection 3.1.1.3, Coast Guard Regulated Navigation Area) to the extent protesters obeyed those restrictions.

The risk of injury to any group of individuals from boating accidents would depend on several factors. One is the number of days with hunt-related trips. Table 4-1 identifies the anticipated number of days with hunt-related trips under each alternative and Subsection 4.1, Introduction, describes the rationale for those numbers. The risk of injury would also depend on the season during which hunting occurs. Hunts that take place during the winter and spring months may have a greater potential to result in injury from boating accidents. This is because the limited hunting season would include periods of rougher weather and sea conditions, which might increase the potential for boating accidents compared to hunts that occur during milder weather and calmer seas. Risk of injury from boating accidents may also depend on the location of the hunt. Generally, the further from shore the hunt occurs, the greater the potential to encounter rough seas, and the potential consequences of any resultant injuries could be aggravated by the increased time needed to transport injured persons to medical facilities on shore. Finally, the risk of injury from boating accidents may also depend on the type of vessel used for hunting (motorized versus canoe). For this analysis, accidents caused by the behavior of protesters on the water, the behavior of a wounded whale, or as a result of attempting to tow a whale to shore, are considered as boating accidents.

Hunters and Other Participants

Protesters on small vessels, jet skis, and a small submarine accompanied the 1999 and 2000 hunts (Subsection 3.15.3.4, Behavior of People Associated with the Hunt). Some protesters attempted to interfere with the hunt by placing their vessels between whales and hunting vessels, charging hunting vessels, or harassing whales to make them move away from hunting vessels (Subsection 3.15.3.4, Behavior of People Associated with the Hunt). This type of vessel operation could cause boating accidents involving hunters or other participants. No hunters or other participants were injured as a result of actions of protest vessel operators during the 1999 and 2000 hunts.

An injured whale could also cause a boating accident. A harpooned whale might ram or otherwise strike boats. A harpooned whale might also swamp a canoe or motorized vessel by swimming away or diving (Subsection 3.4.3.5.3, Whale Response to Being Struck), though the risk would be less with a motorized vessel. Also, the secondary weapon (either a .50 caliber rifle as proposed or an explosive projectile launched from a darting gun or shoulder gun) would most likely kill a wounded whale within minutes of a harpoon strike.

A boating accident could also result if boats became unstable, swamped, capsized, or struck other boats, especially during rough weather or high seas conditions. A boat towing a whale to shore could also become unstable because of the size and weight of the whale. This type of risk would be greater under alternatives that restrict hunting to the winter and spring months (i.e., Alternatives 2, 3, 5, or 6), when the potential for encountering adverse weather conditions is greater than during summer. The risk of boating accidents may also increase with the distance of hunting from shore. Generally, the further from shore the hunt occurs, the greater the transit time and the potential to encounter rough seas. The risk of accidents may also be influenced by the type of vessels used for hunting because motorized vessels are assumed to be less susceptible than human-powered canoes to swamping or capsizing.

Protesters

Persons operating vessels engaged in protests may place themselves at risk of injury from boating accidents. For example, in 2000, one jet ski operator entering the MEZ collided with a Coast Guard vessel and sustained a shoulder injury (Subsection 3.15.3.4, Behavior of People Associated with the Hunt).

In addition, protesters may face a risk of boating accidents from the actions of an injured whale or as a result of adverse weather and sea conditions, as described in Hunters and Other Participants. The risk of injury from a wounded whale would probably be lower for protesters than for hunters, as hunters would likely be closer to injured whales. Similarly, the risk of boating accidents as a result of weather and sea conditions would be lower during hunts that take place during the summer months than during winter and spring.

The potential for boating accidents involving protesters could be reduced by restrictions on the location of hunting. Under Alternative 3, which would restrict hunting to areas more than 5 miles (8 km) from shore, it is possible that fewer protesters would be present (and exposed to injury) because they would not have the capacity to travel that far from shore or keep pace with the hunt vessels. On the other hand, protesters who do accompany an offshore hunt would be exposed to greater risk of injury from boating accidents than with nearshore hunts because of the elevated potential for encountering rough seas.

Bystanders

As described above in 4.15.2.1 Injury from Weapons [Bystanders], bystanders on the water probably would not be close enough to the hunting area to be injured in a boating accident related to protest activities or a wounded whale. The potential for recreational boaters to sustain injury because of adverse weather or sea conditions would be independent of the presence or absence of hunt-related activities under any of the alternatives.

4.15.2.3 Injury from Land-based Protest Activities

Under the No-action Alternative, no whale hunts would be authorized and no whale-hunting protests would occur. There are presently no known incidents of other forms of organized civil disobedience in the area. Under the action alternatives, protesters might stage protests on the road leading to the Makah Reservation, on or near the reservation itself, or on the water around the hunt. Potential risks associated with water-based protests are addressed in Subsection 4.15.2.2, Injury from Boating Accidents. During the 1999 and 2000 hunts, demonstrators on the Makah Reservation exchanged insults with tribal members, including hunters (Subsection 3.15.3.4, Behavior of People Associated with the Hunt). The risk of individuals being injured as a result of protest activities on land would be minimized by implementation of an enforcement management plan similar to that applied during previous hunts. The risk of injury to any group of individuals from protest activities would most likely depend on the number of days with hunt-related activities (Table 4-1).

Hunters and Other Participants

Protest activities on land might expose hunters and other participants (including law enforcement personnel) to risk of injury. No hunters or other participants were injured during the 1999 and 2000 hunts because of protests on land.

Protesters

Protesters might face a risk of injury from the actions of law enforcement personnel, protesters, or counter-protesters. In one incident during the 1998 practice whale hunt exercise, a protester was pushed from a dock but did not sustain injury. There was also an instance of Makah youth throwing rocks at protester vessels, causing no injury but damaging a vessel windshield (Subsection 3.15.3.4, Behavior of People Associated with the Hunt). No protesters were seriously injured during the 1999 and 2000 hunts because of protests on land.

Bystanders

For this analysis, Makah tribal members and non-members who are not actively engaged as hunt participants are considered bystanders, along with persons who are not engaged in protests. During the 1999 and 2000 protests, some tribal members not involved in the hunt engaged protesters, and there were some altercations, although no one was seriously injured (Subsection 3.15.3.4, Behavior of People Associated with the Hunt). Bystanders might approach protest scenes as onlookers or could be drawn into protests, with an attendant risk of personal injury.

4.15.3 Evaluation of Alternatives

The following subsections consider the potential for the alternatives to affect the safety of hunters and other participants, protesters, and bystanders. For each alternative, the discussion addresses the anticipated change in the number of injuries resulting from weapons, boating accidents, or protest activities.

The lowest risk of adverse effects to public safety would occur under the No-action Alternative because no hunting would occur and there would be no associated protest activities. Alternative 2, which would include the highest maximum number of gray whales that could harvested and would be expected to result in the greatest number of days with hunt-related trips (60), would result in the greatest increased risk to public safety from weapons, boating accidents, and protest activities compared to the No-action Alternative. Alternatives 3 and 6 would be expected to result in similar numbers of days with hunt-related trips as Alternative 2 (and during the same times of year) but would impose stricter limits on the number of ENP whales harvested and on the mortality of PCFG whales. As a result, Alternatives 3 and 6 would be expected to have a lower risk of weapons-related injuries, compared to Alternative 2, and a similar risk of injuries as a result of boating accidents or protest activities. Of the action alternatives, Alternative 3 would also have the lowest risk of weapons-related injuries to bystanders on shore because hunting would occur beyond the range of a .50 caliber rifle. The potential for boating accidents under Alternative 3 could be higher than under Alternatives 2 and 6 because hunts would take place farther off shore where there would be a greater risk of encountering rough seas.

Under Alternatives 4 and 5, hunt-related trips would be expected to occur on fewer days than under Alternatives 2, 3, 6 and 7 (22 versus 60 and 37, on average), reducing the potential for injuries as a result of boating accidents or protest activities. Stricter limits on the number of ENP whales harvested and on the mortality of PCFG whales would reduce the number of whales that could be struck and harvested, reducing the potential for weapons-related injuries compared to Alternatives 2, 3, 6 and 7. Lastly, Alternative 4 would include the strictest limits among the action alternatives on the number of whales harvested (1) and would allow hunting only during the summer months when the risk of encountering adverse weather and seas would be lowest. Compared to the other action alternatives, therefore, Alternative 4 would result in the smallest increase, relative to the No-action Alternative, in the risk to public safety from weapons, boating accidents, and protest activities. Alternative 7 may result in an even smaller increase, relative to the No-action Alternative, in the risk to public safety compared to Alternative 4 if: (1) the Tribe does not receive authorization for winter/spring hunts, resulting in a summer/fall hunt every other year for the duration of the 10-year waiver period, or (2) a

low abundance threshold for ENP gray whales is triggered, preventing the Tribe from hunting for the entire waiver period.

4.15.3.1 Alternative 1, No Action

Currently, no whale hunting occurs in the action area, so there are no accidents related to whale hunting. Recreational boaters, commercial and recreational fishers, and commercial vessels currently use the action area (Subsection 3.13.3.2, Marine Vessel Traffic), and there is likely currently some level of injury associated with boating, although the amount is unknown. Hunting also currently occurs in the action area (e.g., for deer and elk), and there is likely some level of injury from weapons associated with hunting, although the amount is unknown. Under the No-action Alternative, there would be no increased risk of injury to individuals beyond those levels that occur under current conditions.

4.15.3.2 Alternative 2, Tribe's Proposed Action

Under Alternative 2, hunt-related trips would likely occur on approximately 60 days from December through May each year, primarily during April and May. Compared to the No-action Alternative (under which there would be no whale-hunt-related injuries), there would be an increased risk of injury from weapons, boating accidents, and protest activities in the action area on each day that hunting occurred. Based on the gray whale harvest limit and restrictions on the mortality of PCFG whales, Alternative 2 would be expected to result in 7 strikes and up to 42 unsuccessful harpoon attempts each year (Table 4-4), plus 64 rifle shots and 12 grenade explosions (Table 4-1). With each strike attempt, rifle shot, or grenade explosion there would be an increased risk, compared to the No-action Alternative, of weapons-related injury to hunt participants, protesters, or bystanders.

Hunt-related trips under Alternative 2 would occur only during winter and spring when there is a greater risk of encountering rough weather. As a result, the potential for injuries from weapons or boating accidents would be elevated compared to hunts that occur during summer when milder weather and calmer seas are more common.

4.15.3.3 Alternative 3, Offshore Hunt

As under Alternative 2, hunt-related trips under Alternative 3 would likely occur on approximately 60 days from December through May each year, primarily during April and May. Compared to the No-action Alternative, Alternative 3 would thus be expected to result in the same increase as Alternative 2 in the number of days with an elevated risk of injury from boating accidents and protest activities. Because tribal hunters would be prohibited from making an initial strike on a gray whale within 5 miles (8 km) of shore, most hunt activities would likely take place more than 5 miles (8 km) off shore. This, and the time of year, would increase the potential for hunt participants and protestors to encounter

rough seas, possibly increasing the potential for boating-related accidents. As discussed in Subsection 4.1.3.2, Potential Number and Type of Vessels, it is assumed for this analysis that whale hunting under Alternative 3 would be conducted from motorized vessels rather than canoes. Because motorized vessels would likely be less susceptible than human-powered canoes to swamping or capsizing, the risk of injury to hunting party participants from boating accidents as a result of rough seas could be offset to an unknown extent by the reduced risk of swamping or capsizing. In addition, the greater distance from shore could limit the number of protest vessels that pursue the hunting party, potentially reducing the number of protesters and law enforcement personnel who are exposed to an elevated risk of boating accidents.

Alternative 3 would include the same limits on the number of whales harvested as Alternative 2 but would impose additional restrictions on the mortality of PCFG whales. Based on the gray whale harvest limit and restrictions on the mortality of PCFG whales, Alternative 3 would be expected to result in 6 strikes and up to 36 unsuccessful harpoon attempts each year (Table 4-6), plus 64 rifle shots and 12 grenade explosions (Table 4-1). With each strike attempt, rifle shot, or grenade explosion, there would be an increased risk, compared to the No-action Alternative, of weapons-related injury to hunt participants, protesters, or bystanders. Because hunts would take place in waters more than 5 miles (8 km) off shore, hunters would have an elevated potential of encountering rough seas while operating weapons, as compared to Alternative 2, possibly increasing the risk of weapons-related injuries. The potential for stray projectiles to strike bystanders on land would be eliminated, however, because the maximum range of the longest-range weapon (a .50 caliber rifle) is less than 5 miles (8 km) (Subsection 3.4.3.5.4, Method of Killing and Time to Death). As with the risk of boating accidents, the greater distance from shore could limit the number of protest vessels that pursue the hunting party, potentially reducing the number of protesters and law enforcement personnel who are exposed to an elevated risk of weapons-related injuries.

4.15.3.4 Alternative 4, Summer/Fall Hunt

Under Alternative 4, the hunting season would extend from June 1 through November 30 instead of December through May. Based on the expectation that locating and striking a known ENP male would take no more than 7 days (Subsection 4.1.4, Alternative 4), hunt-related trips under Alternative 4 would be likely to occur on approximately 7 days every other year. Compared to the No-action Alternative, therefore, Alternative 4 would result in an increased risk to public safety from weapons, boating accidents, and protest activities. This increased risk would occur on fewer days, however, than under any of the other action alternatives (3.5 on average versus 22 to 60).

Hunting under Alternative 4 would likely take place during the summer when the risk of encountering adverse weather conditions or rough seas would be lower than during winter or spring. Compared to the other action alternatives, the ability to hunt during summer under Alternative 4 could reduce the potential associated with each hunt for injury from weapons and boating accidents because of unfavorable weather and sea conditions. Hunting under Alternative 4 may also target whales that are feeding relatively close to shore (compared to whales that are migrating farther off shore at other times of year). If hunting under Alternative 4 occurred closer to shore, there would be an increased risk of injury, per rifle shot, to bystanders on shore compared to the other action alternatives. Based on the gray whale harvest limit and restrictions on the mortality of PCFG whales, Alternative 4 would be expected to result in 1 strike and up to 6 unsuccessful harpoon attempts every other year (Table 4-8), plus up to 16 rifle shots or 3 grenade explosions every other year (Table 4-1). With each strike attempt, rifle shot, or grenade explosion, there would be an increased risk, compared to the No-action Alternative, of weapons-related injury to hunt participants, protesters, or bystanders. The increased risk associated with strike attempts would be less than under any of the other action alternatives due to the lower number of potential strikes, harpoon attempts, shots, and grenade explosions.

4.15.3.5 Alternative 5, Split-season Hunt

Under Alternative 5, the hunting season would be limited to 3 weeks in December and 3 weeks in May, in contrast to the 6-month-long hunting seasons under the other action alternatives. In addition, the landing of a single PCFG whale, or the striking and losing of a single whale, would end the hunt for any given year. Based on the length of the hunting season, Alternative 5 would likely result in approximately 22 days per year with hunt-related trips. This could decrease to 0 days in years in which the hunt is on hiatus to allow the PCFG mortality limit to re-set at one whale. Compared to the No-action Alternative, therefore, Alternative 5 would result in an increased risk to public safety from weapons, boating accidents, and protest activities on approximately 22 days per year—fewer days than under Alternatives 2, 3, 6, and 7(60 and 37 days) but more than under Alternative 4 (7 days).

Based on the gray whale harvest limit and restrictions on the mortality of PCFG whales, Alternative 5 would be expected to result in as many as 5 strikes (likely fewer) and up to 30 unsuccessful harpoon attempts each year (Table 4-10), plus up to 16 rifle shots or 3 grenade explosions (Table 4-1). With each strike attempt, rifle shot, or grenade explosion, there would be an increased risk, compared to the No-action Alternative, of weapons-related injury to hunt participants, protesters, or bystanders. Risks from strike attempts would be less than under Alternatives 2 and 3 but greater than under Alternatives 4,6, and 7. Risks from rifle shots or grenade explosions would be less than under Alternatives 2, 3, 6, and 7 but greater than Alternative 4. However, a hunt under Alternative 4 may

occur closer to shore, potentially posing a greater risk from rifle shots or grenades despite an estimated lower occurrence.

4.15.3.6 Alternative 6, Different Limits on Strikes and PCGF, and Limited Duration of Regulations and Permits

Under Alternative 6, the waiver and implementing regulations would lapse after 10 years. Therefore, the analysis for Alternative 6 considers effects over a 10-year period.

Alternative 6 would be expected to result in the same number of days with hunt-related trips over the course of the 10-year waiver period as Alternative 2 and would include the same restrictions on hunting area and season. Compared to the No-action Alternative, Alternative 6 would thus be expected to result in the same increase as Alternative 2 in the number of days with an elevated risk of injury from boating accidents and protest activities.

Based on the gray whale harvest limit and restrictions on the mortality of PCFG whales, Alternative 6 would be expected to result in an average of 3.5 strikes and up to 21 unsuccessful harpoon attempts each year (Table 4-12), plus up to 56 rifle shots or 11 grenade explosions over 10 years (Table 4-1). With each strike attempt, rifle shot, or grenade explosion, there would be an increased risk, compared to the No-action Alternative, of weapons-related injury to hunt participants, protesters, or bystanders. Based on the anticipated number of strike attempts, this increase would be less than under Alternatives 2, 3, and 5 but greater than under Alternatives 4 and 7. Based on the anticipated number of rifle shots or grenade explosions, this increase would be less than under Alternatives 2 and 3 but greater than under Alternatives 4,5, and 7 (with the caveat that each shot during the summer/fall months of the hunt under Alternatives 4 and 7 could have a greater likelihood of injuring a bystander on shore).

4.15.3.7 Alternative 7, Composite Alternative – Preferred

As under Alternative 6, the waiver and implementing regulations would lapse after 10 years under Alternative 7. Therefore, the analysis for Alternative 7 considers effects over a 10-year period.

To compare the overall impact of Alternative 7 to the impacts of the other six alternatives, we use an annual average number (based on the 10-year span of the waiver period) of 37 days with hunt-related trips, 15 strike attempts, 40 rifle shots, and 7.5 explosive projectiles to harvest an average of two whales per year (Table 4-1). With each strike attempt, rifle shot, or grenade explosion, there would be an increased risk, compared to the No-action Alternative, of weapons-related injury to hunt participants, protesters, or bystanders. Based on the anticipated number of strike attempts, this increase would be less than under Alternatives 2, 3, 5, and 6 but greater than under Alternative 4. Based on anticipated number of rifle shots or grenade explosions, this increase would be less than under

Alternatives 2, 3, and 6 but greater than under Alternatives 4 and 5, unless the Tribe does not receive authorization for any winter/spring hunts over the waiver period.

Implementing a low abundance threshold for the ENP stock may further reduce the risk to public safety under Alternative 7, although it is difficult to determine to what degree and how that may compare against other alternatives. To compare the relative impacts of Sub-alternatives 7(a), 7(b), and 7(c) on public safety, we consider the relative likelihood of triggering the low-abundance threshold of each sub-alternative. Sub-alternative 7(c) carries the highest likelihood of reducing the number of authorized hunting years and, therefore, the annual average number of days with hunt-related trips, rifle shots, and explosive projectiles used over the waiver period. Sub-alternative 7(a), on the other hand, is most likely to allow hunting to occur during all 10 years of the proposed waiver period. As such, of the three sub-alternatives, 7(c) could have the lowest potential impact to public safety while 7(a) could have the greatest potential impact.

4.16 Human Health

4.16.1 Introduction

This subsection addresses the potential for the alternatives to affect human health of the Makah Tribe in the action area. Three issues pertain to human health and whale hunt-related activities: (1) the potential nutritional benefits associated with consuming whale food products, (2) the potential for exposure to contaminants in food items from whale harvests, and (3) the potential for exposure to food-borne pathogens in food items from whale harvests. Based on the information available for this analysis, all of the alternatives would have a reasonably foreseeable potential to affect human health both positively and negatively. There are too many uncertainties, however, to quantify either type of effect or to predict whether any of the alternatives would result in a net positive or negative effect on human health. We therefore analyze these points in greater detail for Alternatives 2 through 7 together in the following subsections.

4.16.2 Evaluation Criteria

Three criteria were used to determine the potential for effects on human health. The first is the change in nutritional benefits the Makah Tribe could experience under any of the alternatives. The second is the amount of environmental contamination tribal members might be exposed to as a result of consuming gray whale products. The last is the extent to which Makah tribal members would be exposed to food-borne pathogens as a result of processing and consuming whale products.

4.16.2.1 Nutritional Benefits

As described in Subsection 3.16.3.1, Nutritional and Health Benefits from Consuming Whale Food Products and Other Traditional Subsistence Foods, marine mammal tissues historically were an important nutritional component of the Makah diet (Renker 2018). Marine mammal tissues, including large whales, contain vitamins, essential elements, and both essential and beneficial polyunsaturated fatty acids (United States Department of Agriculture 2019). While many of these nutrients are present in other foods (e.g., fish, shellfish, nuts, and vegetable oils), some (e.g., polyunsaturated fats) are present in higher concentrations in marine mammal food products. Documented benefits of consuming essential fatty acids present in whale and fish food products include prevention or alleviation of symptoms associated with diabetes, kidney disease, heart disease, hypertension, and other similar health problems (Budowski 1988; Simopoulos 1999; Simopoulos 2002; Holub and Holub 2004; Ebbesson et al. 2005b; Ebbesson et al. 2005c; Reynolds et al. 2006). In addition, whale products provide a good source of antioxidants (vitamin E) and selenium, which play a role in protecting against some contaminants (e.g., mercury) (Arnold and Middaugh 2004). Whale-derived food products are a source of minerals and vitamins that have well-documented nutritional benefits to populations consuming them.

There are no specific studies that compare the types and concentrations of nutrients in food products obtained from the drift whales occasionally consumed by the Makah with those found in the fresh gray whale food products that would be available to them under Alternatives 2 through 7. Whether consuming freshly harvested gray whale food products would affect the level of nutrition available to Makah tribal members would depend largely on the types and levels of nutrition present in an individual tribal member's existing diet relative to several factors: (1) what part(s) of the whale and how much of each would be consumed, (2) what currently consumed food items (and associated nutritional levels) would be replaced by gray whale food products, and (3) how each food item would be collected, stored, and prepared for consumption. None of this information is currently available or could reasonably be obtained.

4.16.2.2 Environmental Contaminants

As described in Subsection 3.16.3.2, Environmental Contaminants in Gray Whales, gray whale tissues contain chemical contaminants that Makah tribal members would be exposed to if they consumed fresh gray whale food products generated from a successful hunt. Similar contaminants are present in the foods that Makah tribal members typically consume, including fish and shellfish from the action area as well as store-purchased food products. There are no data to compare the amount of contaminants currently being consumed by the Makah Tribe with the amount of contaminants found in fresh whale

products, making it difficult to determine the net change in contaminants to which tribal members would be exposed. Also, data do not exist to indicate the amount of fresh whale food products an individual Makah member may consume in lieu of other food sources normally consumed by the same individual. As a result of this lack of data, it is not possible to discern precise risk levels based upon the existing best available information addressing the rate of consumption and method of cooking fresh whale tissues by Makah tribal members. However, it is reasonable to conclude that whale products—in particular blubber—would likely contain higher levels of certain contaminants (e.g., PCBs) than other foods consumed by Makah (and may exceed levels that trigger human health concerns as described in guidelines published by state and federal agencies) (Subsection 3.16.3.2, Environmental Contaminants in Gray Whales). For example, PCB concentrations in Chinook salmon from the Makah National Fish Hatchery (19 µg/kg) (Missildine et al. 2005) are considerably lower than those found in samples of gray whale blubber (39 to 1,200 µg/kg) (Table 3-47).

There are no specific studies that compare the types and concentrations of contaminants in food products obtained from the drift whales occasionally consumed by the Makah with those found in the fresh gray whale food products that would be available to them under Alternatives 2 through 7. High contaminant loads are just one of many causes of death for drift whales, yet even whales that appear to be healthy (e.g., the whale killed by the Makah Tribe in 1999) can have contaminant levels higher than those found in stranded animals (Subsection 3.16.3.2, Environmental Contaminants in Gray Whales). Whether consuming freshly harvested gray whale food products would affect contaminant exposure in Makah tribal members would depend largely on the types and levels of contaminants present in an individual tribal member's existing diet relative to several factors: (1) what part(s) of the whale and how much of each would be consumed, (2) what currently consumed food items (and associated contaminants) would be replaced by gray whale food products, (3) the age and sex of the whale, (4) possibly the time of year and body condition of the whale, and (5) how each food item would be collected, stored, and prepared for consumption. None of this information is currently available or could reasonably be obtained.

4.16.2.3 Exposure to Food-Borne Pathogens

As described in Subsection 3.16.3.3, Exposure to Food-Borne Pathogens, exposure to food-borne pathogens might result from improperly handled food items. While exposure to pathogens associated with the consumption of whale products has been documented, it is not unique to consumption of whale food products. Pathogenic organisms (e.g., bacteria, viruses, and parasites) are common in other subsistence and store-purchased foods such as seafood, poultry products, meat products, dairy products, and vegetables. Any of these products could cause illness if they were improperly butchered, stored, or

prepared. Thus, under the No-action Alternative, there is some degree of risk to Makah tribal members of contracting food-borne illness from exposure to pathogens. Changes in the quantity of freshly harvested whale consumed would probably not appreciably change the potential for food-borne illness to occur in Makah tribal members, assuming they followed the same general food storage and preparation practices for whale products as for other food products.

4.16.3 Evaluation of Alternatives

The following subsections consider the potential for the alternatives to affect human health using the evaluation criteria described above.

4.16.3.1 Alternative 1, No Action

Under the No-action Alternative, no Makah gray whale hunt would be permitted. Thus, Makah tribal members would not have access to or consume freshly harvested whale products. Under this alternative, no change in the exposure to contaminants or food-borne pathogens or the nutritional composition of the diet from foods consumed by the Makah Tribe would be expected. The continued absence of freshly harvested gray whale food products from the diet of the Makah would continue to preclude tribal members from realizing the added nutritional benefits (e.g., minerals and omega-3 fatty acids) associated with consuming them, but there are no data to suggest that current diets of individual Makah members sufficiently lack these nutritional benefits. For example, the omega-3 fatty acid benefits of whale products (e.g., prevention of heart disease and glucose intolerance) may be adequately realized by tribal members from other food sources. Overall, there is insufficient information to conclude that the lack of fresh whale products under the No-action Alternative would be expected to negatively alter current dietary conditions for any tribal member.

4.16.3.2 Alternatives 2, 3, 4, 5, 6, and 7

Unlike conditions under the No-action Alternative, Alternatives 2, 3, 4, 5, 6, and 7 would allow the Makah Tribe to conduct gray whale hunts in the action area, and it is assumed that consumption of freshly harvested gray whale food products would occur. In household surveys conducted in 2001, 2006, 2011, and 2017, 80 to 90 percent of survey respondents expressed an interest in increased access to whale products (Subsection 3.10.3.5.1, Makah Whaling). Consumption could increase exposure to contaminants or food-borne pathogens and would depend in part on the number of whales likely to be harvested per year. This number would be greatest under Alternatives 2 and 3 (up to five whales), followed by Alternative 6 (up to 3.5 whales, on average), then Alternatives 4, 5, and 7 (zero to two whales per year). Whale products (meat, blubber, and other whale parts) consumed from the whale killed in 1999 amounted to approximately 2.4 pounds per person, but much of the whale was consumed at a community potlatch. The Tribe's most recent needs statement (Renker 2018) estimates that

harvesting an average of four gray whales per year would yield 8 to 20 pounds (4 to 9 kg) of meat per capita and 16 to 20 pounds (7 to 9 kg) of oil or blubber per capita (and a somewhat smaller amount of whale oil after rendering). Given these estimates, it is possible for a Makah tribal member to ingest up to 24 to 40 pounds (11 to 18 kg) of whale product per year under Alternatives 2 and 3. Harvesting an average of two gray whales per year under Alternative 7 would yield 4 to 10 pounds (2 to 10 kg) of meat per capita and 8 to 10 pounds (4 to 10 kg) of oil or blubber per capita, the second-lowest amount of the action alternatives. As described in Subsection 4.16.2, Evaluation Criteria, it is impossible to predict the precise changes in exposure to contaminants or food-borne pathogens or the nutritional composition of the Makah diet if they have the opportunity to consume freshly harvested whale products. However, it is reasonable to conclude that whale products—in particular blubber—would likely contain higher levels of certain contaminants (e.g., PCBs) than other foods consumed by Makah, such as Chinook salmon (Missildine et al. 2005).

Consumption of freshly harvested gray whale food products may temporarily increase the overall nutritional value of the Makah diet by raising the proportion of certain minerals and omega-3 fatty acids if diets currently lack this benefit. Omega-3 fatty acids have been shown to positively affect glucose tolerance and insulin sensitivity in Alaska Natives (Ebbesson et al. 2005b; Ebbesson et al. 2005c). This relative nutritional increase would occur only as long as whale products were available for consumption. The extent of the nutritional increase would depend in part on the number of whales likely to be harvested per year. This number would be greatest under Alternatives 2 and 3 (up to five whales), followed by Alternative 6 (up to 3.5 whales, on average), then Alternatives 4, 5, and 7 (zero to two whales per year, on average).

Implementing a low abundance threshold for the ENP stock may reduce the amount of edible gray whale products available to the Tribe under Alternative 7. To compare the relative impacts of Sub-alternatives 7(a), 7(b), and 7(c) on human health, we consider the relative likelihood of triggering the low-abundance threshold of each sub-alternative. Of the three sub-alternatives, (c) carries the highest likelihood of reducing the number of authorized hunting years and, therefore, the total number of whales harvested over the waiver period. Sub-alternative 7(a), on the other hand, is most likely to result in the harvest of the full amount permitted under the waiver (20 whales). As such, of the three sub-alternatives, 7(c) could have the lowest potential impact to human health while 7(a) could have the greatest potential impact.

Also, under Alternatives 6 and 7, the waiver and implementing regulations would lapse after 10 years, and it is not possible to predict whether they would be replaced with a new waiver and implementing

regulations or what the terms of any new waiver and regulations would be. Therefore, the analysis for Alternatives 6 and 7 consider effects only over a 10-year period.

4.17 Regulatory Environment Governing Harvest of Marine Mammals

4.17.1 Introduction

This subsection evaluates the potential for the seven alternatives to affect the future regulatory environment governing marine mammals in the United States (including whales) and whales worldwide. Any change in the regulatory environment may ultimately affect the harvest of marine mammals nationally and whales worldwide.

4.17.2 Evaluation Criteria

We used three criteria to determine the potential for the alternatives to affect the regulatory environment governing the harvest of marine mammals. The first is the potential change in requests for waiver of the MMPA take moratorium to allow harvest in the United States of marine mammals other than whales. The second is the potential change in requests for regulatory action to authorize harvest of whales in the United States, which would require application to the IWC for a catch limit, waiver of the MMPA take moratorium (with associated MMPA regulatory actions following NEPA review), and completion of a cooperative agreement under the Whaling Convention Act (WCA). The third is the potential change in IWC regulation of commercial, scientific, or aboriginal subsistence whaling.

Under the No-action Alternative, we would deny the Makah Tribe's request to hunt whales, and under Alternatives 2 through 7, we would authorize some level of whaling. The analysis in this subsection considers the potential precedential effect of authorizing a hunt—the possibility that authorizing a Makah gray whale hunt may lead to future regulatory changes that would in turn lead to increased hunts of whales or other marine mammals. Because such a precedent could result from any authorization of Makah whaling, even one whale per year, we anticipate that any authorization under the action alternatives (2 through 7) would have the same precedential effect. We therefore analyze Alternatives 2 through 7 together.

4.17.2.1 National Regulation of Marine Mammal Harvest

Section 101(a)(3)(A) of the MMPA directs the Secretary to determine whether and by what means it is compatible with the Act to waive the moratorium and allow taking of any marine mammal. In the history of the MMPA, there have been few requests to the Secretary of the Interior or the Secretary of Commerce to waive the MMPA take moratorium (Subsection 3.17.3.1, Waivers of the MMPA Take Moratorium). Currently, there are no active requests for waiver of the MMPA take moratorium aside from the Makah Tribe's request to hunt gray whales.

Under any of the action alternatives, we would waive the take moratorium, adopt regulations, and issue permits under the MMPA. This authorization and a subsequent hunt could lead other parties to seek similar authorizations to harvest marine mammals other than whales. Some Indian tribes traditionally harvested and used products from seals, sea otters, and other marine mammals. Northwest Indian tribes have, in the past, expressed an interest in harvesting marine mammals (Schmitten 1994). Authorization of a Makah gray whale hunt could revive the interest of the Makah or other tribes in hunting marine mammals. It could also lead to interest by non-Indians in sport or commercial hunting of marine mammals. Such interest could lead to additional requests for MMPA waivers from Indian tribes or non-Indians and could, ultimately, lead to the federally authorized harvest of additional marine mammals if such harvest is consistent with the MMPA.

4.17.2.2 National Regulation of Whaling

Section 102(f) of the MMPA prohibits commercial whaling in U.S. waters. Subsection 916c(a) of the WCA prohibits whaling except in accordance with IWC regulations. Thus, under current law, only aboriginal subsistence whaling authorized by the IWC is permitted in U.S. waters. Other Indian tribes historically hunted whales (Subsection 3.4.3.6.1, Aboriginal Subsistence Whaling), and the authorization of a Makah whale hunt under the action alternatives could lead other tribes to request a similar authorization. There are no active requests for national authorization of whale hunts under the WCA except from the Makah Tribe and Alaska Eskimo Whaling Commission (Alexander 2013).

4.17.2.3 International Regulation of Whaling

Public comments on our 2008 Draft Environmental Impact Statement (DEIS) expressed concern that NMFS' approval of Makah whaling could lead to increased whaling worldwide by creating a new category of cultural whaling, thus weakening U.S. leadership in whale conservation or strengthening the position or resolve of whaling proponents. This analysis addresses the potential for the alternatives to change the IWC regulatory environment with respect to commercial and scientific whaling and with respect to aboriginal subsistence whaling. Changes in these types of whaling might occur because of changes in the U.S. position or persuasive authority, changes in other countries' willingness to pursue whaling in response to U.S. actions, or changes in the interpretation of what constitutes aboriginal subsistence whaling.

4.17.3 Evaluation of Alternatives

For each alternative, the discussion first addresses the anticipated change in the number of requests for waivers of the MMPA take prohibition for marine mammals other than whales and the potential change in the number of marine mammals killed in the United States as a result. Historically, there have been few requests to waive the MMPA take moratorium, suggesting there would be few in the future under

current conditions. Under the No-action Alternative, such requests would be even less likely, as both Indian and non-Indian parties would be discouraged by the time and effort required to seek a waiver and by the negative results of the Makah request. Conversely, under Alternatives 2 through 7, we would authorize a Makah gray whale hunt, and that authorization would make it more likely for parties to seek an MMPA waiver compared to the No-action Alternative.

For each alternative, the analysis next considers potential changes in the number of requests for aboriginal subsistence whale hunt authorizations and the potential change in the number of whales killed in the United States as a result. There have been no requests for whale hunts historically, except by the Alaska Eskimo Whaling Commission and the Makah Tribe. The No-action Alternative would make it less likely that Indian tribes would seek authorization in the future compared to current conditions; any of the action alternatives could make it more likely, compared to the No-action Alternative. Whether such requests would result in a change in national regulations governing harvest of marine mammals is speculative because it would depend on variables associated with the specific request that are currently unknown.

Finally, for each alternative the analysis considers potential changes in IWC regulations governing any type of whaling and the potential change in the number of whales killed worldwide as a result. Changes could come about because of changes in the U.S. position at the IWC, changes in U.S. persuasive authority, or changes in the actions of other countries in response to U.S. action under one of the alternatives. It is speculative to predict how any of the alternatives would influence the regulatory landscape, given the legislative process of the IWC and the competing views and interests of the IWC parties. It is possible that denial of the Makah Tribe's request under the No-action Alternative would dampen efforts to set catch limits for whaling of any type, particularly aboriginal subsistence whaling. It is conversely possible that the approval of harvesting even a single whale per year under the action alternatives would encourage efforts to set catch limits for additional whaling, particularly aboriginal subsistence whaling.

4.17.3.1 Alternative 1, No Action

Under the No-action Alternative, we would not authorize a gray whale hunt by the Makah Tribe.

4.17.3.1.1 National Regulation of Marine Mammal Harvests

As described in Subsection 3.17.3.1, Waivers of the MMPA Take Moratorium, there have been very few requests for waiver of the take moratorium, and none since 1987 except the Makah Tribe's request. We would therefore predict very few requests in the future under current conditions. Denial of the Makah Tribe's request under the No-action Alternative would make it even less likely there would be future requests for a waiver, as both Indian and non-Indian parties would be discouraged by the time

and effort required to seek a waiver and by the negative results of the Makah request. Because of the negligible chance of future requests or authorizations under current conditions, the No-action Alternative would not measurably change the likelihood of future requests or the number of marine mammals killed in the United States as a result of such requests.

4.17.3.1.2 National Regulation of Whaling

Except for the Alaska Eskimo Whaling Commission and the Makah Tribe, there are no other groups in the United States that have requested authorization to pursue an aboriginal subsistence whale hunt. We would therefore predict very few requests in the future under current conditions. Denial of the Makah Tribe's request under the No-action Alternative would make it even less likely there would be future requests for authorization of aboriginal subsistence whaling, as any Indian tribes with a potential claim to aboriginal subsistence status would be discouraged by the time and effort required to seek a waiver and by the negative results of the Makah request. Because of the negligible chance of future requests or authorizations under current conditions, the No-action Alternative would not measurably change the number of whales killed in the United States by aboriginal subsistence whale hunters.

4.17.3.1.3 International Regulation of Whaling

Commercial and Scientific Whaling

Subsection 3.17.3.2.1, Commercial and Scientific Whaling, describes the current conditions regarding international regulation of commercial and scientific whaling. It is unlikely that denial of the Makah Tribe's request under the No-action Alternative would change the international regulatory environment for either type of whaling. The United States has consistently supported the ban on commercial whaling since 1972, and has consistently opposed the increases in scientific whaling. This position did not change with the U.S. request for a catch limit on behalf of the Alaska Eskimo Whaling Commission or the Makah Tribe, and there is no reason to expect it would change if we adopted the No-action Alternative and denied the Makah Tribe's request.

Similarly, there is no reason to expect that denial of the Makah Tribe's request would alter the persuasive authority of the United States or the actions of other countries in the IWC regarding commercial and scientific whaling. As described in Subsection 3.17.3.2.1, Commercial and Scientific Whaling, the debate over commercial whaling has dominated IWC interactions for many years, and past scientific whaling by Japan appears to have been a tool to gain leverage in that debate. Even if the Makah Tribe's request to hunt gray whales were denied under the No-action Alternative, the United States would likely still pursue aboriginal subsistence catch limits for the Alaska Eskimo Whaling Commission and support the requests of other countries for aboriginal subsistence catch limits. Thus, under the No-action Alternative, pro-whaling countries could still argue that the U.S. actions on

aboriginal subsistence whaling were inconsistent with its opposition to commercial and scientific whaling.

Aboriginal Subsistence Whaling

Denial of the Tribe's request under the No-action Alternative has the greatest potential to affect aboriginal subsistence whaling because that is the regulatory provision under which the IWC has set a catch limit for gray whales, which is shared by the Chukotkan Natives in Russia and the Makah Tribe in the United States. The IWC first set a catch limit on behalf of the Makah Tribe in 1998. We authorized a Makah whale hunt in 1999 and 2000 and have not authorized a hunt since 2000 because of litigation and administrative processes. There is no evidence to suggest that the current administrative process related to the Tribe's request (or the lack of authorization during that process) has changed any of the dynamics in the IWC or had an effect on the regulatory environment for aboriginal subsistence whaling within the IWC. We therefore consider it unlikely that denial of the Tribe's request under the No-action Alternative would have an effect on the regulation of aboriginal subsistence whaling that would represent a change from the current condition.

4.17.3.2 Alternatives 2, 3, 4, 5, 6, and 7

Under Alternatives 2 through 7, we would waive the MMPA take moratorium, promulgate hunt regulations that would allow the Tribe to apply for hunt permits, and complete the required processes under the WCA.

4.17.3.2.1 National Regulation of Marine Mammal Harvests

In contrast to the No-action Alternative, under which a denial of the Tribe's request would discourage future requests for marine mammal harvests, authorization of the Makah Tribe's request under Alternatives 2 through 7 could encourage others (including the Makah Tribe) to consider seeking a waiver of the MMPA take moratorium to allow harvest of gray whales or other marine mammals. Thus, there could be an increased likelihood of future requests. We consider the increased likelihood to be small. First, as described in Subsection 3.17.3.1, Waivers of the MMPA Take Moratorium, there have been very few requests for waiver of the take moratorium, and none since 1987 except the Makah Tribe's request. This is likely the result of the complexity of the waiver process, the length of time required to complete the process, and the lack of resulting harvest opportunities. These factors would continue to limit interest in seeking MMPA waivers, even if a Makah whale hunt were authorized under one of the action alternatives. The most likely increase in waiver applications would come from other treaty tribes, who might view the approval of the Makah's application as a precedent for approval of additional waiver applications to take marine mammals that they had harvested traditionally and that remained important to them for cultural or other reasons. If authorization of a hunt under one of the

action alternatives (Alternatives 2 through 7) did lead to additional waiver requests, the outcome of any process to consider them would depend on a number of facts specific to the requests that are not presently known, making it speculative to conclude that the harvest of marine mammals nationally would change as a result of implementing Alternatives 2 through 7. Any additional waiver requests for marine mammals would be subject to analyses under NEPA as well as the MMPA.

4.17.3.2.2 National Regulation of Whaling

Aside from Indian tribes and Alaska Natives, we are not aware of entities in the United States that could claim aboriginal status to pursue whaling under the WCA. Alaska Natives have received WCA allocations for bowhead whales since 1978. The Makah Tribe formally expressed interest in resuming a gray whale hunt starting in 1995 (Makah Tribal Council 1995). We first published a WCA quota for the Tribe's use in 1998 (63 FR 16701, April 6, 1998). The 1998 to 2002 gray whale catch limit in the Schedule was in response to a joint U.S.-Russian Federation request on behalf of the Makah Tribe and Chukotka Natives (Subsection 1.2.4.1.3, IWC Aboriginal Subsistence Whaling). Although it has been over 35 years since Alaska Natives first received a WCA allocation and over 25 years since the Makah Tribe received its allocation, no other Indian tribe or Alaska native group has requested an allocation or inquired about receiving an allocation for whales under the WCA. This history suggests that, beyond the Makah and the Alaska Eskimo Whaling Commission, there is little interest by other native groups to seek authorization to harvest whales. In addition, the complexity of the process and length of time required to complete it would probably limit the interest of most potential applicants. It therefore seems unlikely that implementation of Alternatives 2 through 7 would lead other Indian tribes to seek authorization to hunt whales.

Nevertheless, tribes other than the Makah traditionally hunted gray whales (Subsection 3.4.3.6.1, Aboriginal Subsistence Whaling), and authorization of a Makah gray whale hunt could encourage them to seek a similar authorization. If authorization of a hunt under Alternatives 2 through 7 did lead to additional requests to hunt gray whales, the outcome of any process would depend on a number of facts specific to those requests that are not presently known, making it speculative to conclude that the harvest of gray whales nationally would change as a result of implementing Alternatives 2 through 7.

Authorization of the Makah Tribe's request under Alternatives 2 through 7 could also lead the Makah Tribe or other tribes to request additional authorization to hunt other species of whale besides gray whales. Comments on our 2008 DEIS noted past interest by the Makah Tribe in hunting humpback whales, and tribes other than the Makah traditionally hunted humpback whales (Subsection 3.4.3.6.1, Aboriginal Subsistence Whaling). In the eastern North Pacific, the Central America DPS and the Mexico DPS of humpback whales are currently listed under the ESA and therefore a waiver of the

MMPA take moratorium is not possible (the western North Pacific DPS is also listed). Any future request to hunt gray whales, or humpback whales if they were delisted, would need to be authorized by the IWC and go through NEPA, MMPA, and WCA processes. The complexity of the process and length of time required to complete it would probably limit the interest of most potential applicants, including the Makah Tribe. If authorization of a hunt under Alternatives 2 through 7 did lead to an additional waiver request by the Makah Tribe or other tribes, the outcome of any process would depend on a number of facts specific to those requests that are not presently known, making it speculative to conclude that the harvest of whales nationally would change as a result of implementing Alternatives 2 through 7.

4.17.3.2.3 International Regulation of Whaling

Commercial and Scientific Whaling

Subsection 3.17.3.2.1, Commercial and Scientific Whaling, describes the current conditions regarding international regulation of commercial and scientific whaling. Since the early 1970s, the United States has consistently supported the moratorium on commercial whaling and insisted on safeguards before any such whaling can resume. The United States has also opposed lethal scientific whaling. In taking these positions, the United States has cited management concerns rather than a philosophy that all whaling of any kind should be banned. Throughout the period of time the United States has opposed commercial and lethal scientific whaling, it has supported aboriginal subsistence whaling, for example, by proposing and defending bowhead catch limits on behalf of Alaska Natives. Given the consistent U.S. position of opposing commercial and lethal scientific whaling while supporting aboriginal subsistence whaling, it is unlikely that NMFS' authorization of a Makah tribal hunt under Alternatives 2 through 7 would change the U.S. position on commercial and lethal scientific whaling or its ability to actively pursue its position.

It is also unlikely that other countries could use authorization of a Makah whale hunt under Alternatives 2 through 7 as leverage for increased commercial or scientific whaling. Though Japan attempted to use the bowhead catch limit by the United States request in 2002 in its pursuit of small-type coastal whaling, there is no evidence that this move led to a fundamental change in the U.S. position, in the positions of other countries, or in the international regulation of whaling. There is also no evidence that whaling proponents such as Japan could successfully use the U.S. authorization of a Makah hunt under domestic law as leverage to change the regulation of commercial or scientific whaling. It is more likely that the outcome of Japan's requests for small-type coastal whaling, or the pro-whaling nations' efforts to remove the moratorium on commercial whaling, depends on the balance of

power in the IWC rather than on strategic maneuvers such as those that took place in 2002 over the bowhead catch limit.

The support of Japan and the other pro-whaling countries for the ENP gray whale catch limit even as they were opposing the U.S. ASW bowhead catch limit in 2002 (Subsection 3.17.3.2.2 Aboriginal Subsistence Whaling) also suggests that pro-whaling countries do not view the Makah hunt as leverage to change the regulation of commercial or scientific whaling. In 2007, bowhead and ENP gray whale aboriginal subsistence catch limits were set by consensus at the annual meeting of the IWC (Subsection 1.4.1.2.1, Relevant Overview of Requests for Bowhead Whales on Behalf of Alaska Eskimos; Subsection 1.4.1.2.2, Overview of Requests for ENP Gray Whales on Behalf of the Makah). The IWC has subsequently set these catch limits in a block vote with the humpback catch limit request of St. Vincent and the Grenadines (Subsection 1.4.1.2.2, Overview of Requests for ENP Gray Whales on Behalf of the Makah).

Pro-whaling nations have argued that all whaling should be treated equally, limited only by principles of sound science and management. These nations could argue that the resumption of whaling by the Makah Tribe justifies an increase in other types of whaling. They might also argue that the ability of the Makah Tribe to sell handicrafts made from inedible parts (which would be authorized under Alternatives 2 through 7) makes the hunt "commercial," although this is allowed under the IWC's definitions for "subsistence use" and "aboriginal subsistence whaling." We consider it unlikely, however, that pro-whaling nations would be able to use this argument as leverage to change the regulation of commercial or scientific whaling. The United States and several other countries have a long history of opposing commercial and scientific whaling while supporting aboriginal subsistence whaling; thus, authorization of a Makah hunt would not introduce a new element into the long-standing debate over whether there is a difference between commercial and subsistence hunts. Moreover, Alaska Natives have been authorized under domestic law to make and sell handicrafts made from bowhead whales.

Another piece of evidence suggests that aboriginal subsistence whaling generally, and authorization of a Makah hunt in particular, would not influence the debate over commercial and scientific whaling. The working group proposal presented at the 2010 IWC meeting included trade-offs between scientific and commercial whaling (Subsection 3.17.3.2.1, Commercial and Scientific Whaling). Aboriginal subsistence whaling appears not to have been a consideration in the proposed compromise between scientific and commercial whaling interests.

To further test the conclusion that authorization of a Makah hunt under Alternatives 2 through 7 would not alter international regulation of commercial or scientific whaling, we analyzed the trends both before and after the initial U.S. request for a catch limit on behalf of the Makah Tribe. If a Makah hunt

were to set a precedent that would affect whaling internationally, such effects would likely be revealed shortly after the United States made its request. Figure 4-1 shows trends in commercial whaling, which declined prior to 1993, increased from 1993 through 1997, then flattened after 1998. The decline in commercial harvest began in 1988, following adoption of the commercial whaling moratorium and the U.S. threat to withdraw fishing privileges for Japanese vessels in U.S. waters (Subsection 3.17.3.2.1, Commercial and Scientific Whaling). Commercial whaling resumed in 1993, before the first U.S. request at the IWC on behalf of the Makah Tribe, and increased until 1998, at which point the trend leveled off. This record indicates that the U.S. request for an aboriginal subsistence catch limit of gray whales for the Makah Tribe did not lead to a change in the regulation of commercial whaling or a change in the level of whales harvested commercially. In more recent years, commercial harvest rates have remained constant since 2013; see Figure 3-18 for commercial harvest rates across the entire time series until 2021.

Figure 4-2 shows the data for scientific whaling, which increased steadily from 1986 through 1996, and continued to increase after 1997, though there is no statistically detectable trend from 1997 to the present. This record also indicates that the U.S. request for an aboriginal subsistence catch limit of gray whales for the Makah Tribe did not lead to a change in the regulation of scientific whaling or a change in the level of whales harvested in scientific studies. In more recent years, scientific harvest rates have remained constant since 2013; see Figure 3-19 for scientific harvest rates across the entire time series until 2019.

Aboriginal Subsistence Whaling

Compared to the No-action Alternative, there is a potential that NMFS' authorization of a Makah whale hunt under Alternatives 2 through 7 would be viewed as an expansion of the definition of aboriginal subsistence whaling, leading to increased requests at the IWC for aboriginal subsistence catch limits, changes in the regulation of aboriginal subsistence whaling, and ultimately an increase in whaling within that category. One distinction between Makah whale hunting and other aboriginal subsistence hunts approved by the IWC is the Tribe's 70-year hiatus in whaling. There is the possibility that pro-whaling nations would use a perceived expansion of the definition to bolster their requests for whaling operations that have characteristics similar to aboriginal subsistence whaling but differ in some way. Japan's argument that small-type coastal whaling is similar to aboriginal subsistence whaling is an example of how an IWC party might use Makah whaling to support its desired whaling operations.

Such an argument has been made, however, even in the absence of a Makah hunt. While there is evidence that pro-whaling parties within the IWC will use the authorization of any whaling activities, including a Makah hunt for gray whales, to support their efforts to receive approval for their proposed whaling operations, it is speculative whether such maneuvers would lead to a change in the regulation of aboriginal subsistence whaling or an increase in such whaling. Language adopted by the IWC when the

joint United States-Russian Federation request was first approved referred to "aborigines whose traditional aboriginal subsistence and cultural needs have been recognized," suggesting the possibility that each IWC party was free to recognize the subsistence and cultural needs of its aborigines (IWC 1998). This language, which was subsequently deleted from the schedule, appears not to have influenced subsequent discussion in the IWC about the definition of aboriginal subsistence whaling or the determination of need.

As noted above, if a Makah whale hunt were to have a precedential effect on whaling regulations, it is likely such an effect would have been manifested following approval of the initial U.S. request for a catch limit on the Makah Tribe's behalf. Figure 4-3 shows the trend in aboriginal subsistence harvests from 1984 through 2013. The trend prior to 1998 is confounded by the fact that the hunt by the Chukotka Natives ceased altogether in 1992 and 1993 following the dissolution of the Soviet Union and state support for the hunt. It began to rebuild slowly and did not recover to the point that the full catch limit was harvested until 1998.

Looking just at the trend since 1997 when the Makah catch limit was approved, there has been a slight increasing trend in aboriginal subsistence harvests. The trend is weakly defined; only 27 percent of the harvest variability is explained by the trend line. The trend becomes much slighter if 1997 is dropped out. The rationale for dropping 1997 is that it is unlikely there would have been any effect on harvests in 1997 from the U.S. request made and approved in October 1997. Thus, it appears that any correlation (which does not imply causation) with the U.S. request for a Makah hunt is weak. In more recent years, aboriginal subsistence harvest rates have remained relatively constant since 2013; see Figure 3-20 for ASW harvest rates across the entire time series until 2021.

We also examined the history of requests in the IWC for aboriginal subsistence catch limits since the initial U.S. request for a Makah gray whale catch limit in 1997. Since then, there have been no requests from additional countries for an aboriginal subsistence catch limit and no requests on behalf of additional aboriginal groups. Denmark/Greenland and St. Vincent and the Grenadines have requested increases to their catch limits, but these were made on the basis of aboriginal needs and there is no indication the requests were in response to the U.S. request for gray whales. From 1998 to 2013, aboriginal subsistence strike and catch limits (i.e., annual not-to-exceed levels reported in the IWC annual reports) for all species have fluctuated between 403 and 432 animals. There is no apparent correlation between these limits and the actual numbers of whales harvested by aboriginal subsistence hunters globally, as evidenced by some of the lowest harvests occurring during a period with the highest overall aboriginal catch limits (Figure 4-3).

For these reasons, we consider it unlikely that authorization of a Makah whale hunt under Alternatives 2 through 7 would change the international regulatory landscape for aboriginal subsistence whaling or lead to the increased harvest of whales in aboriginal subsistence whale hunts (relative to the No-action Alternative).

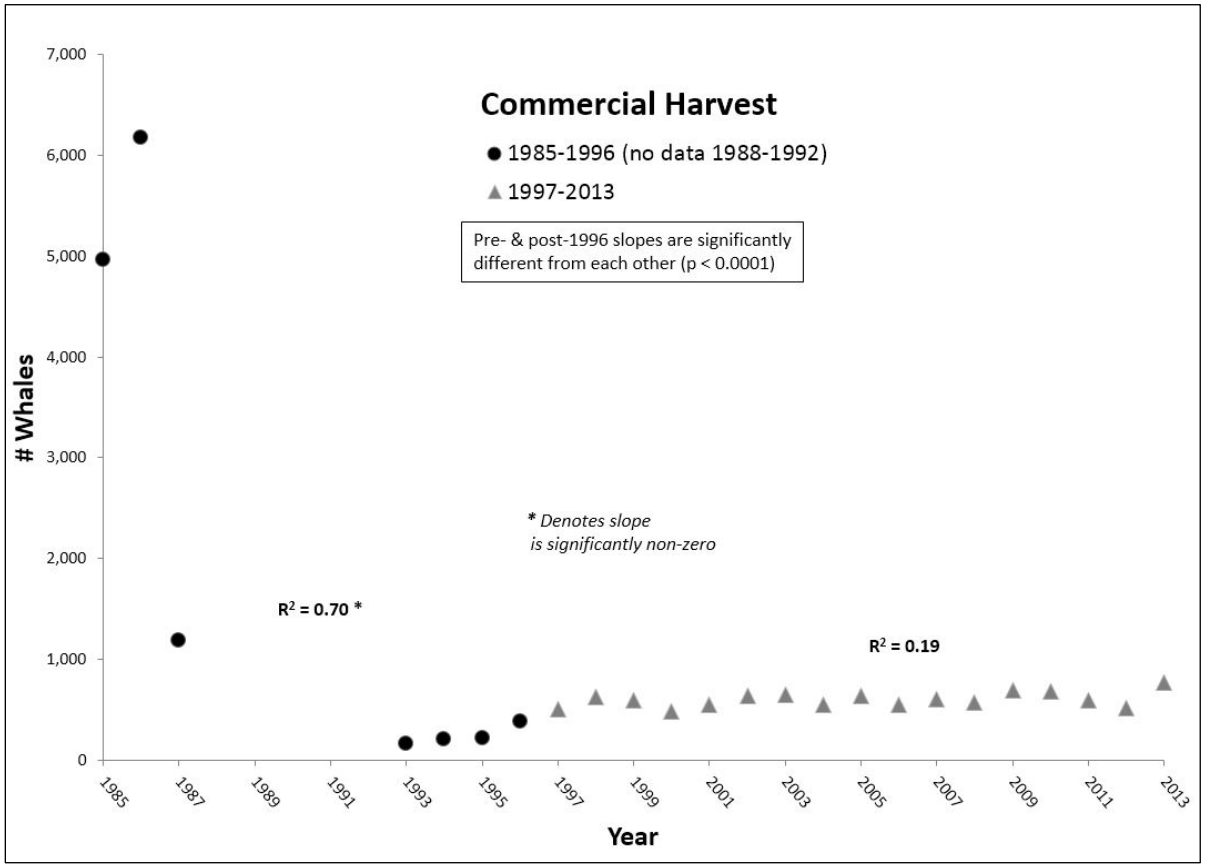

Figure 4-1. Trend analysis for commercial harvest before and after 1996. See Figure 3-18 for commercial harvest rates across the entire time series until 2021.

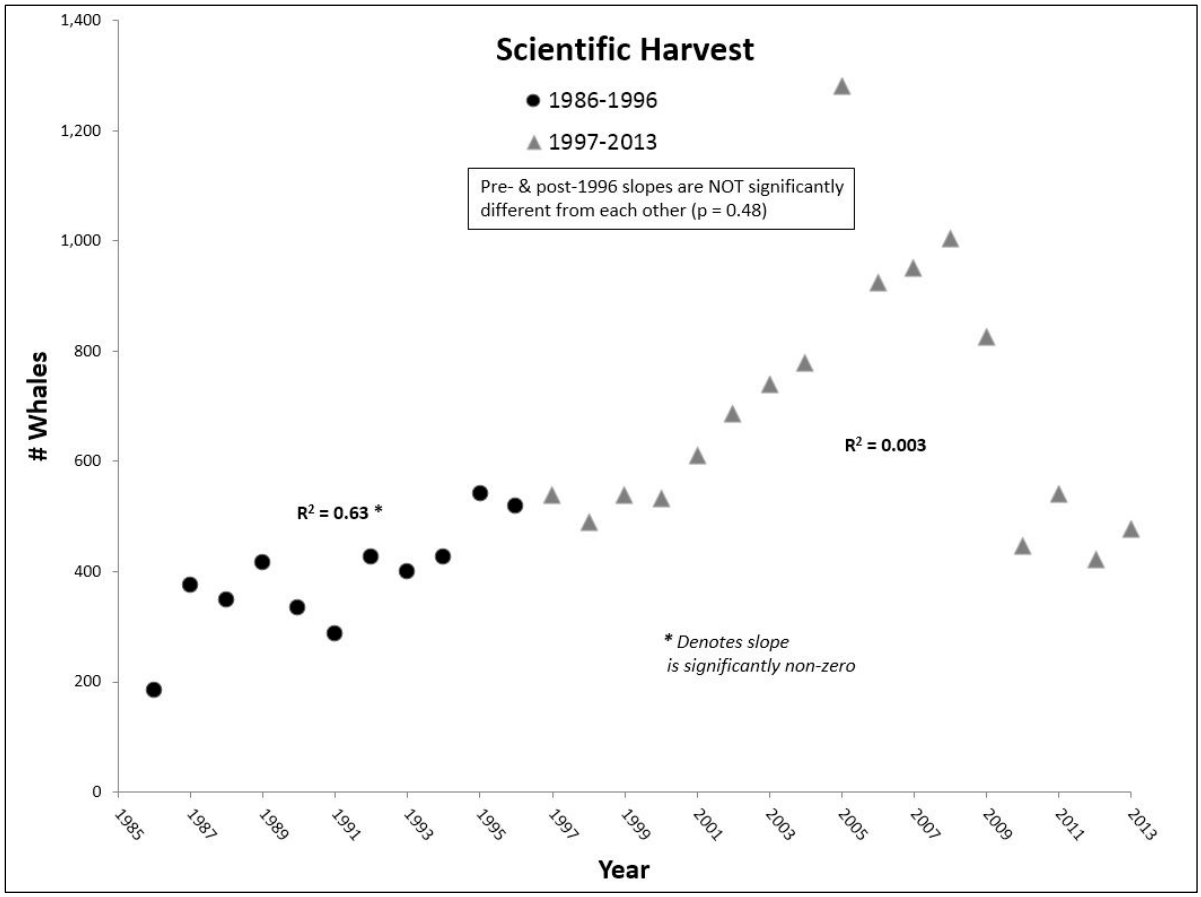

Figure 4-2.Trend analysis for scientific whaling before and after 1996. See Figure 3-19 for scientific harvest rates across the entire time series until 2019.

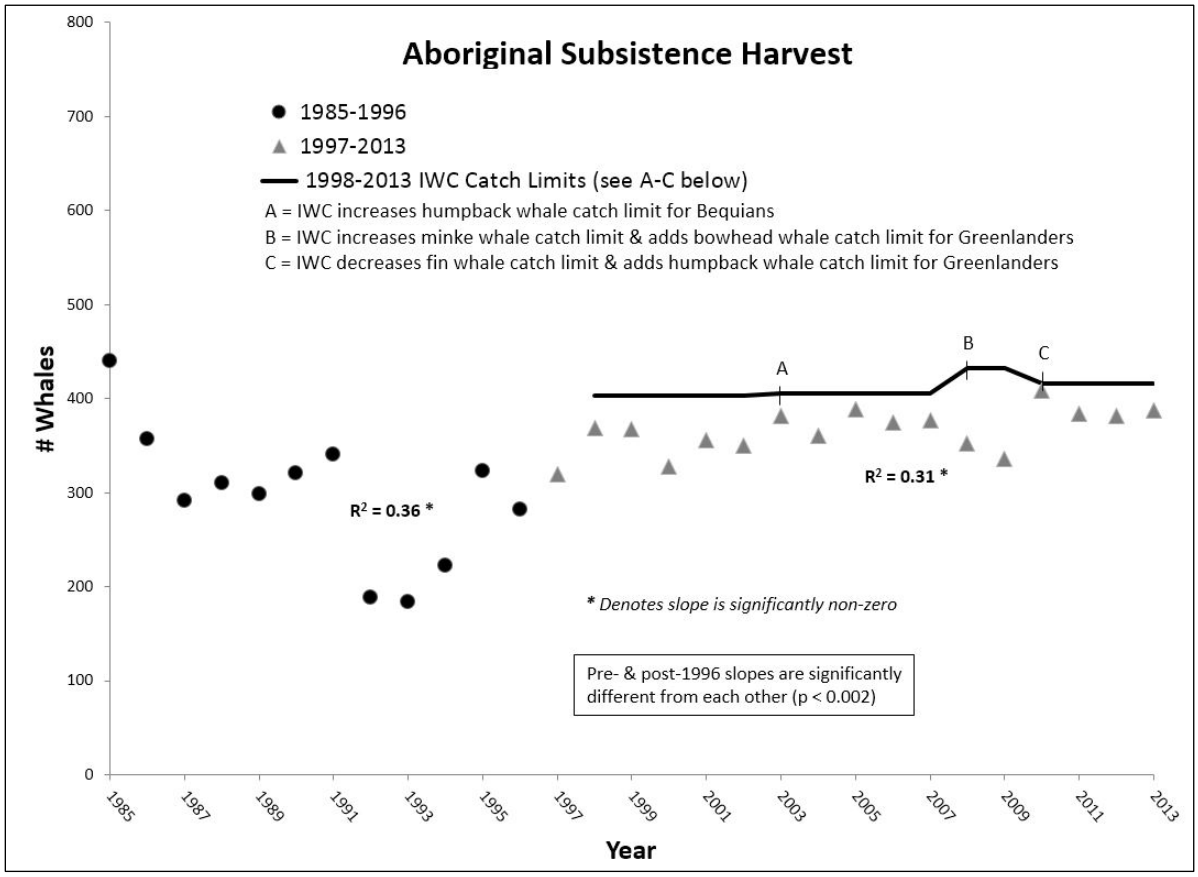

Figure 4-3. Trend analysis for aboriginal subsistence whaling before and after 1996. See Figure 3-20 for aboriginal subsistence harvest rates across the entire time series until 2021.

4.18 Alternative Comparison by Resource

Table 4-17 draws together the conclusions from the information and discussion presented above in the "Evaluation of Alternatives" subsections and summarizes the results of our analyses for each of the resources. This table is provided as an aid for the reader but is not intended to replace the more detailed discussion in the subsections above. Alternative 1 is the No-action Alternative and is the baseline for comparing the action alternatives.

Table 4-17. Summary of Effects of the Various Alternatives.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
WATER QUALITY	**Groundwater**	Current risk levels would continue.	No expected effect.	Similar to Alternative 2.	Similar to Alternatives 2 and 3.	Similar to Alternatives 2-4.	Similar to Alternatives 2-5.	Similar to Alternatives 2-6.	None of the action alternatives are likely to increase the risk of adverse impacts on groundwater.
	Marine Waters	Current risk levels would continue (includes occasional disposal of drift whale carcasses).	Increased vessel traffic creates increased risk of fuel spills, but spills would be small scale, localized, and rapidly diluted. Spills could also be mitigated by modifying existing spill response plans. Negligible increased risks from disposal/leakage of whale carcasses.	Similar to Alternative 2, although restricting the hunt to offshore marine waters and the reliance on motorized vessels could increase the risk of spills in offshore marine waters. Negligible increased risks from disposal/leakage of whale carcasses.	Lower than Alternatives 2 and 3; fewer hunt-related trips and better weather conditions would reduce the risk of vessels capsizing in unanticipated storms. Negligible increased risks from disposal/leakage of whale carcasses. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Lower than Alternatives 2 and 3, but greater than Alternative 4 (based on number of hunt-related trips). Negligible increased risks from disposal/leakage of whale carcasses. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar to Alternatives 2 and 3.	Lower than Alternatives 2, 3, and 6 due to fewer days with hunt-related trips and better weather conditions in summer/fall hunt years, but greater than Alternatives 4 and 5 with more days with hunt-related trips. Negligible increased risks from disposal/leakage of whale carcasses.	All action alternatives are likely to increase the risk of adverse impacts on marine water quality. Alternative 2 would likely have the most impact, while Alternative 4 would likely have the least impact.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
MARINE HABITAT AND DEPENDENT SPECIES	**Pelagic Species and Communities**	Current levels of disturbance would continue.	Increased vessel traffic and carcass hauling could result in local, short-lived disturbance of fish, zooplankton, and other pelagic species. No appreciable ecological effects.	Similar to Alternative 2, although the potential for disturbance would be largely restricted to offshore areas.	Lower than Alternatives 2 and 3 because of reduced hunt-related traffic. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Lower than Alternatives 2 and 3, but greater than Alternative 4 because of increased hunt-related traffic. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar to Alternatives 2 and 3, but greater than Alternatives 4 and 5 because of increased hunt-related traffic.	Lower than Alternatives 2, 3, and 6 due to fewer days with hunt-related activities (hunt-related traffic) and fewer harvested whales, but greater than Alternatives 4 and 5.	All action alternatives are likely to increase the risk of adverse impacts on pelagic species and communities. Alternative 2 would likely have the most impact, while Alternative 4 would likely have the least impact.
	Benthic Species and Communities	Current levels of disturbance would continue.	Increased vessel traffic and carcass hauling could result in local, short-lived disturbance of marine plant, macroalgal, shellfish, and other benthic species. No appreciable ecological effects.	Similar to Alternative 2.	Similar to Alternatives 2 and 3. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar to Alternatives 2-4. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar to Alternatives 2-5.	Similar to Alternatives 2-6.	All action alternatives could increase the risk of adverse impacts on benthic species and communities. Alternative 4 would likely have the least impact.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
GRAY WHALES	**ENP Gray Whale Stock**	Current IWC-set catch limits would continue. ENP gray whale stock is likely to remain at or near carrying capacity.	No discernable impacts because overall harvest would remain at IWC-set levels.	Similar to Alternative 2.	Similar to Alternatives 2 and 3.	Similar to Alternatives 2-4.	Similar to Alternatives 2-5.	Similar to Alternatives 2-6.	None of the action alternatives are likely to increase the risk of adverse impacts on the ENP gray whale stock.
	WNP Gray Whale Stock	The IWC has not set a catch limit for WNP gray whales.	A small likelihood (median probability = 0.056 to 0.084) of striking a WNP gray whale each year if the maximum number of strikes occur.	Smaller likelihood (median probability = 0.048 to 0.072) of striking a WNP gray whale compared to Alternative 2.	No impacts expected based on hunt timing.	Smaller likelihood (median probability = 0.04 to 0.06) of striking a WNP gray whale compared to Alternatives 2 and 3.	Smaller likelihood (median probability = 0.028 to 0.042) of striking a WNP gray whale compared to Alternatives 2, 3, and 5.	Smaller likelihood (median probability = 0.024 to 0.035) of striking a WNP gray whale in winter/spring hunt years compared to Alternatives 2, 3, 5, and 6; No impacts in summer/fall hunt years based on hunt timing.	All action alternatives (except perhaps Alternative 4) are likely to increase the risk of adverse impacts on the WNP gray whale stock. Alternative 2 would have the most risk while Alternative 4 would have the least risk.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
GRAY WHALES (CONTINUED)	**PCFG Gray Whales**	No hunting would occur in the PCFG seasonal range.	Under current conditions, 1.9 (maximum of 6) PCFG whales are likely to be killed per year. If more than 3.0 whales are killed, they may not be replaced in a subsequent year and would exceed current estimates of PBR. It is unclear whether the intensity of unsuccessful harpoon attempts (17 per year) or approaches (142 per year) would result in more than a temporary disturbance of PCFG whales and cause them to avoid this portion of their range.	Compared to Alternative 2, approximately 1.6 (maximum of 3) PCFG whales are likely to be killed per year, and fewer PCFG whales would be subjected to unsuccessful harpoon attempts (9.8 per year). The number of PCFG whales approached per year would be the same as Alternative 2.	Compared to Alternative 2, the hunt would focus on known males in the PCFG seasonal range. The maximum and likely number of PCFG whales killed per year is 0.5 (1 every other year). Also, fewer PCFG whales would be subjected to unsuccessful harpoon attempts (6 every other year) and approaches (58 every other year).	Compared to Alternative 2, approximately 0.25 (i.e., one PCFG whale every 4 years) and a maximum of one PCFG whale is likely to be killed per year. Far fewer PCFG whales would be subjected to unsuccessful harpoon attempts (1.5 per year) and approaches (33 per year). Effects would be the same as the No-action Alternative during years of hunt hiatus.	Compared to Alternative 2, approximately 0.96 (maximum of 3.5) PCFG whales are likely to be killed per year, and less than half the PCFG whales would be subjected to unsuccessful harpoon attempts (5.5 per year). The number of PCFG whales approached per year would be the same as under Alternative 2.	Compared to Alternative 2, Approximately 1.4 (maximum of 3 in winter/spring hunt years, 2 in summer/fall hunt years) PCFG whales are likely to be killed per year, and half the PCFG whales would be subjected to unsuccessful harpoon attempts, on average (8.5 per year). The number of PCFG whales approached would be up to 142, if the Tribe utilizes all allowable approaches each year and if each approach is made on a unique individual.	All action alternatives are likely to increase the risk of adverse impacts on PCFG gray whales. Alternative 2 would likely have the most impact, while Alternative 5 would likely have the least impact.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
GRAY WHALES (CONTINUED)	**Gray Whales Using the Makah U&A and OR-SVI Areas**	No hunting would occur in local survey areas.	Under current conditions, 1.6 Makah U&A whales or 1.8 OR-SVI whales might be killed per year. It is unclear whether killed whales would be replaced in the same year in which they were killed or in subsequent years because of the uncertainties regarding PCFG recruitment. It is also unclear whether the intensity of unsuccessful harpoon attempts (11 to 12 per year) or approaches (82 to 92 per year) would result in more than a temporary disturbance of whales using local survey areas.	Compared to Alternative 2, slightly fewer Makah U&A or OR-SVI whales might be killed (1.4 to 1.6 per year, respectively). The number of such whales subjected to unsuccessful harpoon attempts would also be lower (8 to 9 per year); however, the number approached per year would be the same as under Alternative 2.	Compared to Alternative 2, the hunt would focus on known males in the PCFG seasonal range. The maximum and likely number of Makah U&A or OR-SVI whales killed per year is 0.5 (1 every other year). Also, fewer whales would be subjected to unsuccessful harpoon attempts (6 every other year) and approaches (58 every other year).	Compared to Alternative 2, far fewer Makah U&A or OR-SVI whales might be killed (0.21 to 0.24 per year, or roughly 1 whale every 4-5 years). The number of such whales subjected to unsuccessful harpoon attempts (approximately 1.2 to 1.4 per year) and approaches (28 to 32 per year) would also be much lower than under Alternative 2. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Compared to Alternative 2, fewer Makah U&A or OR-SVI whales might be killed (0.82 to 0.92 per year). The number of such whales subjected to unsuccessful harpoon attempts would also be lower (5 to 6 per year); however, the number approached per year would be the same as under Alternative 2.	Compared to Alternative 2, fewer Makah U&A and OR-SVI whales might be killed (1.4 per year, on average). The number of such whales subjected to unsuccessful harpoon attempts would also be lower (8.1 to 8.3 per year, on average); however we assume that the number approached under Alternative 7 would be 142 if the Tribe utilizes all allowable approaches every year and that each approach is made on a unique individual.	All action alternatives are likely to increase the risk of adverse impacts on gray whales using local survey areas. Alternative 2 would likely have the most impact, while Alternative 5 would likely have the least impact.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
GRAY WHALES (CONTINUED)	**Individual Whales**	On average, 124 whales could be harvested in the Chukotkan hunt annually, experiencing manner and time to death particular to that hunt. Approximately 3 percent would be struck and lost.	On average, four whales annually could be harvested in a Makah hunt rather than a Chukotkan hunt. Manner and time to death would be similar to the Chukotkan hunt (if Makah use grenades) or shorter (if Makah use a .50 caliber rifle). As many as 43 percent (i.e., 3 out of 7 whales) could be struck and lost in a Makah hunt, compared to approximately 3 percent under Alternative 1. It is likely that non-lethal takes would not result in more than a temporary disturbance of whales.	Similar to Alternative 2 except that motorized hunts may result in quicker kills and fewer struck-and-lost whales. The number of whales subjected to disturbance from unsuccessful harpoon attempts would also be lower (36 per year); however, the number approached per year would be the same as under Alternative 2. Approaches by non-hunt-related vessels might also be lower because of the offshore nature of this hunt.	Similar to Alternative 2 except that summer/fall hunts would have better ocean and weather conditions that may result in quicker kills and fewer struck-and-lost whales. Also, fewer whales would be subjected to disturbance from unsuccessful harpoon attempts (6 every other year) and approaches (58 every other year).	Similar to Alternative 2 except that the number of whales subjected to disturbance from unsuccessful harpoon attempts (30 per year) and approaches (122 per year) would be lower. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar to Alternative 2 except that the number of whales subjected to disturbance from unsuccessful harpoon attempts would be lower (21 per year), while the number approached would be the same.	Similar to Alternative 2 except the average annual harvest in the Makah hunt would be lower (2 per year, on average), and fewer whales would be subjected to unsuccessful harpoon attempts per year (16 on average), while the number approached would be the same. An alternating hunt season would allow the Tribe to hunt in summer/fall months every other year when better ocean and weather conditions may result in quicker kills and fewer struck-and-lost whales.	All action alternatives are likely to increase the risk of adverse impacts on individual gray whales. Alternative 2 would likely have the most impact, while Alternative 4 would likely have the least impact.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
OTHER WILDLIFE SPECIES	**Marine Mammals**	Current levels of disturbance would continue.	Hunt-related activities would increase the number of vessels and aircraft and the amount of noise in the action area over approximately 60 days. Chance of disturbance is low because the action area is large, most hunting would occur well offshore of pinniped haulouts, and most marine mammals do not associate with gray whales (except killer whales). Any disturbance would be temporary and localized. Injury from vessel collisions or projectiles is unlikely.	Similar to Alternative 2, although limiting hunt to offshore marine areas would likely reduce any disturbances and risks to marine mammals (e.g., all pinniped haulouts are within 5 miles of shore).	Similar to Alternatives 2 and 3, but fewer hunt-related trips. There is a greater potential for hunt-related activities to disturb seals and sea lions because hunted whales would likely be feeding closer to shore and in close proximity to islands, rocks, and pinniped haulouts. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Lower than Alternative 2 (because of fewer hunt-related trips) and Alternative 4 (because of seasonal restrictions), but potentially higher than Alternative 3 because hunting would be closer to shore. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar to Alternative 2.	Lower than Alternatives 2, 3, and 6 due to fewer days with hunt-related activities as well as fewer gunshots and grenade explosions, however the summer/fall hunt activities could have a great potential for disturbance to pinnipeds, as described under Alternative 4. Greater potential for disturbance than Alternative 4 and 5 due to larger number of days with hunt-related activities.	All action alternatives could increase the risk of adverse impacts on marine mammals. Alternative 2 would likely have the most impact, while Alternative 5 would likely have the least impact.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
OTHER WILDLIFE SPECIES (CONTINUED)	**Other Marine Wildlife**	Current levels of disturbance would continue.	Hunt-related activities would increase the number of vessels and aircraft and the amount of noise in the action area over approximately 60 days. Disturbance would vary among species and habitat associations and in most cases would be localized and temporary. Most serious impact would be nest abandonment. Tatoosh and White Rock Islands would have buffers. Concerns about nest abandonment could be addressed by including buffers around other rocks and islands.	Similar to Alternative 2, although limiting the hunt to offshore marine areas would likely reduce any risks to other marine wildlife (e.g., all rocks and islands used for nesting are within 5 miles of shore).	Although hunting would occur on fewer days than under Alternatives 2 and 3, disturbance of seabirds, bald eagles, and murrelets could be higher given the overlap with nesting, fledging, and foraging periods. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Lower than Alternative 2 (because of fewer hunt-related trips) and Alternative 4 (because of seasonal restrictions), but potentially higher than Alternative 3 because hunting would be closer to shore. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar to Alternative 2.	Lower than Alternatives 2, 3, and 6 due to fewer days with hunt-related activities as well as fewer gunshots and grenade explosions, however summer/fall hunt periods overlap with nesting, fledging, and foraging periods of seabirds, eagles, and murrelets. Greater potential for disturbance than Alternative 4 and 5 due to larger number of days with hunt-related activities.	All action alternatives could increase the risk of adverse impacts on other marine wildlife. Alternative 2 would likely have the most impact while Alternative 5 would likely have the least impact due to seasonal restrictions and limited days with hunt-related activities.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
Environmental Justice	**Economics**	Current levels of tourism would continue. Current occasional household use of products from drift whales and whales incidentally caught in fishing operations (potentially one whale every 10 years).	Potential for short-term increase in visitors to Neah Bay during 7 to 30 days of hunting. Other visitors might avoid Neah Bay because of a hunt. Long-term effects on number of visitors are uncertain. Household use of products from up to four whales.	Similar to Alternative 2, but possibly fewer whale products available when hunts are curtailed because of the mortality limit on PCFG whales.	Fewer hunt days and whales would result in a smaller increase in economic benefits than under all other Alternatives. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar or lower economic benefits than Alternatives 2 and 3 because of fewer hunt days and number of whales likely harvested. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar or lower economic benefits than Alternatives 2 and 3 (but higher than Alternatives 4 and 5) because of number of whales likely harvested.	Similar to lower economic benefits than Alternatives 2, 3, and 6 but higher than Alternatives 4 and 5 because of the number of whales likely harvested (2 per year, on average).	All action alternatives are likely to have a mix of beneficial and adverse impacts on economics. Alternative 2 would have the greatest likelihood of mixed impacts, while Alternative 4 would have the least.
	Ceremonial and Subsistence Resources	Current limited availability of drift whales and whales incidentally caught in fishing operations (potentially one whale every 10 years). Lack of access to resource has disproportionate impact on Tribe.	Consistent with Makah's stated need for access to ceremonial and subsistence resources.	Similar to Alternative 2, but possibly fewer whale products available when hunts are curtailed by the mortality limit on PCFG whales.	Fewer hunt days and whales would result in a smaller increase in ceremonial and subsistence effects than under all other Alternatives. Stored whale products may still be available during years of hunt hiatus.	Similar or lower ceremonial and subsistence effects than Alternatives 2 and 3 because of fewer hunt days and number of whales likely harvested. Stored whale products may still be available during years of hunt hiatus.	Similar or lower ceremonial and subsistence effects than Alternatives 2 and 35 (but higher than Alternatives 4 and 5) because of number of whales likely harvested.	Similar or lower ceremonial and subsistence effects than Alternative 2, 3, and 6, but higher than Alternative 4 and 5 because of the number of whales likely harvested.	All action alternatives are likely to have beneficial impacts on ceremonial and subsistence resources. Alternative 2 would likely have the most impact, while Alternative 4 would likely have the least impact.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
ENVIRONMENTAL JUSTICE (CONTINUED)	**Social Environment**	Potential for tension between Makah Tribe and others, including federal government.	Potential for tension between Makah Tribe and others. Potential for social bonding among some tribal members and tension among others. Native Americans generally might be reassured by U.S. support for traditional tribal activity.	Similar to Alternative 2.	Similar to Alternatives 2 and 3, although limits on maximum number of whales struck/harvested would result in fewer occasions for hunt-related social interactions compared to Alternatives 2 and 3, and tension may be reduced during years of a hunt hiatus.	Similar to Alternatives 2-4, although tension may be reduced during years of a hunt hiatus.	Similar to Alternatives 2-5.	Similar to Alternatives 2-6.	All action alternatives are likely to have a mix of beneficial and adverse impacts on the social environment. Alternative 2 would have the greatest likelihood of mixed impacts, while Alternative 4 would have the least.

	Resources	Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
SOCIAL ENVIRONMENT	**Makah Tribal Members, Other Tribes, and Other Individuals and Organizations**	Likely no protests and related social tensions. No change from current level of tension between members opposed to the hunt and those supporting it. The latter may feel continued frustration with U.S. government.	Tension could increase between hunt opponents and supporters, with opponents likely to protest. Supporters are likely to feel reassured by U.S. government support for traditional tribal activity.	Some hunt opponents may feel less tension if there is a reduced likelihood of the Tribe killing a PCFG whale in nearshore waters. Tension may increase for some hunt supporters and opponents if there is an emphasis on hunting without the traditional use of canoes. The degree of tension by hunt opponents could be affected by the number of whales killed. The maximum number of whales killed would be 3, predicted at 1.2, resulting in lower potential of social tension in comparison to Alternative 2.	Similar to Alternatives 2 and 3, although the decrease in hunting days would result in fewer opportunities for expression of social tension than other alternatives with sustained hunt times. Degree of tension expressed by hunt opponents could be affected by whales killed. Maximum number of whales hunted under Alternative 4 is one every other year, potentially resulting in a lesser degree of social tension than all other alternatives.	Similar to Alternatives 2-4, although the decrease in hunting days (as well as the hunt hiatus) would result in fewer opportunities for expression of social tension than other alternatives with sustained hunt times. The maximum of one whale being killed would decrease the potential for social tension in comparison to other alternatives.	Similar to Alternatives 2-5, although having a lower potential for expression of social tension than Alternative 2 but a greater potential than Alternatives 4 and 5 based on the likely number of whales killed.	Similar to Alternatives 2-6, although having a lower potential for expression of social tension than Alternatives 2, 3, and 6 but a greater potential than Alternatives 4 and 5 based on the likely number of whales killed.	All action alternatives are likely to have a mix of beneficial and adverse impacts on Makah tribal members, other tribes, and other individuals and organizations. Alternative 2 would have the greatest likelihood of mixed impacts while Alternative 4 would have the least.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
CULTURAL RESOURCES	**Sites with Cultural Significance**	No change from current conditions.	It is possible, but improbable, that activities related to a whale hunt would damage or disturb (e.g., encroachment by observers) existing, listed archaeological or historic sites. Unlisted sites traditionally used by Makah whalers would be enhanced by their use for whale hunting-related ceremonies.	Similar to Alternative 2.	Similar to Alternatives 2 and 3. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar to Alternatives 2-4. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar to Alternatives 2-5.	Similar to Alternatives 2-6.	All action alternatives are likely to have a mix of beneficial and adverse impacts on sites with cultural significance. Alternative 2 would have the greatest likelihood of mixed impacts, while Alternative 4 would have the least.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
CEREMONIAL AND SUBSISTENCE RESOURCES	**Access to Whale Hunting Opportunities**	No change from current conditions, i.e., no access to whale hunting opportunities.	Compared to No-action Alternative, increased access to hunting opportunities associated with harvesting an average of four whales per year.	Similar to or less than Alternative 2 because hunts would be restricted to offshore marine waters and could be curtailed by the mortality limit on PCFG whales.	Fewer hunt days and whales would result in less access to hunting opportunities than under other Alternatives. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Fewer hunt days and whales would result in less access to hunting opportunities than under Alternatives 2 and 3. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar or lower access to hunting opportunities than Alternatives 2, and 3 but higher than Alternatives 4 and 5 because of number of hunt days and whales likely harvested.	Similar or lower access to hunting opportunities than Alternative 2, 3, and 6, but higher than Alternatives 4 and 5 because of the number of hunt days and whales likely harvested.	All action alternatives are likely to have beneficial impacts on access to whale hunting opportunities. Alternative 2 would likely have the most impact, while Alternative 4 would likely have the least impact.
	Subsistence Use	The Tribe could pursue some subsistence uses of whales (such as using drift whales or whales incidentally caught in fishing operations), but they would have limited cultural value if not practiced in connection with actual whale hunts.	Compared to the No-action Alternative, increased subsistence use of whales because of opportunity to hunt (up to 33 estimated days of hunting) and opportunity to process, share, and consume up to an average of four whales per year (maximum of five).	Similar to Alternative 2, except motorized hunts may increase the opportunity for subsistence use of whales in more seasons (including southbound whales in the winter). The Tribe's subsistence use would be less than Alternative 2 because no hunting would be allowed within 5 miles of the shore and restrictions on the mortality of whales could result in curtailment of hunting activities in some years, potentially before any whales are harvested.	The maximum harvest limit would satisfy less than 15% of the number of whales requested by the Makah Tribe. Stored whale products may still be available during years of hunt hiatus.	The Tribe's subsistence use of whales would be less under Alternative 5 than Alternatives 2 and 3 because fewer whales would likely be harvested. Compared to Alternative 4, subsistence use could be greater because of the increase in the maximum number of whales harvested per year. Stored whale products may still be available during years of hunt hiatus.	Alternative 6 would impose an additional requirement on the Tribe requiring them to submit a new request for waiver and invest resources in the pursuit of a waiver if they desired to continue hunting after the initial 10-year waiver and regulation lapse. The average of 3.5 whales per year would be slightly lower than the amount requested by the Tribe to satisfy their needs (four whales). The Tribe's subsistence use of whales would be greater under Alternatives 2 and 3 and less under Alternatives 4 and 5 in comparison to Alternative 6 on the basis of allowance of harvested whales per year.	Alternative 7 would impose an additional requirement on the Tribe requiring them to submit a new request for waiver and invest resources in the pursuit of a waiver if they desired to continue hunting after the initial 10-year waiver and regulation lapse. The average of 2 whales per year would be half the amount requested by the Tribe to satisfy their needs (four whales). The Tribe's subsistence use of whales would be greater under Alternatives 2, 3, and 6and less under Alternatives 4 and 5 in comparison to Alternative 7 on the basis of allowance of harvested whales per year.	All action alternatives are likely to have beneficial impacts on subsistence use of whale products. Alternative 2 would likely have the most impact, while Alternative 4 would likely have the least impact.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
CEREMONIAL AND SUBSISTENCE RESOURCES (CONTINUED)	**Cultural Identity**	Tribal identity could erode in the absence of opportunities to participate in an activity central to Makah cultural identity.	Makah whale-hunting rituals, spiritual training, songs, dances, and ceremonial activities could increase over current conditions and regularly recur, reinforcing Makah cultural identity. The opportunity to regularly harvest, process, share, and consume whale products could increase tribal members' sense of community. The whale-hunting ceremonies could provide an additional social framework, which could contribute to community social and spiritual stability.	Similar to Alternative 2.	Similar to Alternatives 2 and 3.	Similar to Alternatives 2-4.	Similar to Alternatives 2-5.	Similar to Alternatives 2-6.	All action alternatives are likely to have beneficial impacts on the Tribe's cultural identity.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
NOISE	**Noise Levels at Receiving Properties**	No change from current conditions.	Increased noise levels from vessels and aircraft at receiving properties in Neah Bay and possibly along State Route 112 east of Neah Bay during an estimated 33 days of hunting and 60 days of hunt-related activity. Increased noise levels from 64 rifle shots or 12 grenade explosions. Noise may also be audible to recreational users in the hunt vicinity. Limited number of recreational visitors may be affected because hunting would occur in winter and early spring when visitation is lower.	Similar to Alternative 2 except that limiting hunt activity to offshore marine waters could reduce noise levels (especially from weapons discharge) at receiving properties because of increased distance.	Similar increased noise levels as in Alternative 2, occurring on fewer days compared to all other action alternatives. Fewer rifle shots (16 every other year) and grenade explosions (3 every other year) compared to Alternative 2. This alternative has a greater potential than any others to disturb recreational users in the action area on any given day of hunting or hunt-related activities because of hunt time being in peak usage during summer months and the targeting of nearshore feeding whales. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar increased noise levels as in Alternative 2. Disturbance would occur on fewer days than Alternatives 2 and 3 but more days than Alternative 4. Same number of rifle shots and grenade explosions as Alternative 4. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar increased noise levels as in Alternative 2 (but a larger increase in noise levels than Alternatives 4 and 5 because of more hunting days and weapons discharges). Similar number of rifle shots (56) and grenade explosions (11) as Alternatives 2 and 3 (with 64 rifle shots and 12 grenade explosions).	Similar increased noise levels as Alternative 2, occurring on fewer days than Alternatives 2, 3, and 6 but more days than Alternatives 4 and 5. Fewer rifled shots (40) and grenade explosions (8), on average, than Alternatives 2, 3, and 6 but more than Alternatives 4 and 5. Hunt activities during the summer/fall hunt seasons have a greater potential to disturb recreational users in the action area on any given day because of peak usage during the summer months and targeting of nearshore feeding whales.	All action alternatives are likely to increase the risk of adverse impacts on noise levels at receiving properties. Alternative 2 would likely have the most impact, while Alternative 4 would likely have the least impact.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
AESTHETICS	**On-scene Observers**	Current lack of opportunity to view an authorized whale hunt would continue.	Harvest of four whales during an estimated 33 days of hunting would be visible to observers at beaches and vantage points along coastal portion of action area. Hunting during winter/spring period when visitation is lower would reduce number of unintentional observers.	Compared to Alternative 2, there would be about the same number of days of hunting (20 versus 7 to 30), but because hunting would be limited to offshore marine waters, fewer on-scene observers would unintentionally observe a whale being hunted.	Compared to Alternatives 2 and 3, there would be fewer days with hunt-related trips and opportunities for on-scene observers. However, the number of potential casual observers present in the action area on any given day of hunting would be greater under Alternative 4 than under the other action alternatives because hunting would occur during the summer months when recreational use of the action area is higher. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Compared to Alternatives 2 and 3, there would likely be fewer days of hunt-related trips and opportunities for on-scene observers. Alternative 5 would result in more days of hunt-related trips than Alternative 4, but those days would occur during the winter and spring months when recreational use of the action area is comparatively low. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar to Alternative 2.	Compared to Alternatives 2, 3, and 6, there would be fewer days of hunting, on average, per year, however the number of potential casual observers present in the action area on any given day during the summer/fall hunts would be greater than during the winter hunt seasons of those alternatives. Compared to Alternatives 4 and 5, Alternative 7 would present greater opportunities for on-scene observers due to the number of hunting days.	All action alternatives are likely to have a mix of beneficial and adverse impacts on on-scene observers. Alternative 2 would have the greatest likelihood of mixed impacts, while Alternative 4 would have the least.

	Resources	Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
	Media Observers	Current lack of opportunity to view an authorized whale hunt would continue.	Any whale hunts would receive media coverage. However, inclement weather during the hunt period could limit media coverage.	Similar to Alternative 2 except that offshore hunting may reduce the ability of media outlets to directly observe hunt activity.	Similar to Alternatives 2 and 3, although having fewer hunt days would likely result in a smaller increase in media attention than other alternatives. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Compared to Alternatives 2 and 3, there would likely be fewer days of hunt-related trips and presence of media observers. Alternative 5 would result in more days of hunt-related trips than Alternative 4. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar to Alternative 2.	Compared to Alternative 2, 3, and 6, there would likely be fewer days of hunt0related trips and presence of media observers, but more than Alternatives 4 and 5.	All action alternatives are likely to have a mix of beneficial and adverse impacts on media observers. Alternative 2 would have the greatest likelihood of mixed impacts while Alternative 4 would have the least.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
TRANSPORTATION	**Highway, Marine, and Air Traffic**	No change from current conditions.	Increased hunt-related traffic could increase potential for interference with highway, marine, or air traffic in the action area and could increase the risk of traffic accidents. However, hunts would be limited to the winter and early spring months and would not overlap with peak periods for highway or air traffic.	Similar to Alternative 2, although hunting would take place further offshore.	Fewer days of hunting (but in the summer) would likely result in fewer occasions for interference with highway, vessel, and air traffic, but a greater potential for each occasion to result in interference. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar to Alternatives 2 and 3, although the increased potential for interference, accidents, or impediments would be limited to the months of December and May (more likely during May), outside of the peak periods for highway and air traffic. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar to Alternative 2.	Fewer days of hunting per year (on average) than Alternative 2, 3, and 6 would likely result in fewer occasions to interference with highway, vessel, and air traffic, but a greater potential for each occasion to result in interference in summer/fall hunt seasons.	All action alternatives are likely to increase the risk of adverse impacts on highway, marine, and air traffic. Alternative 2 would likely have the most impact, while Alternative 4 would likely have the least impact.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
PUBLIC SERVICES	**Law Enforcement and Medical Facilities**	No change from current conditions.	Hunt-related protests could increase law enforcement needs, possibly diverting such resources from other missions. Persons suffering hunt-related injuries that exceed the capacities of local health facilities could be transported to other facilities in the region.	Similar to Alternative 2, except that potential motorized vessel hunts offshore in the winter and early spring could result in fewer hunt-related protest activities but could also increase the need for search/rescue and medical attention because of boating accidents associated with rough seas.	The potential for conflict between hunt-related law enforcement needs and other law enforcement needs would be higher during the summer; however, there is less potential for boating accidents because of better sea conditions. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Less than Alternatives 2 and 3 because of fewer hunt-related trips but greater than alternative 4. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar to Alternative 2.	Less than Alternatives 2, 3, and 6 because of fewer hunt-related trips but greater than Alternatives 4 and 5. The potential for conflict between hunt-related law enforcement needs and other law enforcement needs would be higher during the summer/fall hunt seasons; however, there is less potential for boating accidents because of better sea conditions.	All action alternatives could increase the risk of adverse impacts on law enforcement and medical facilities. Alternative 2 would likely have the most impact, while Alternative 4 would likely have the least impact.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
PUBLIC SAFETY	**Injury from Weapons, Boating Accidents, and Land-based Protest Activities**	No change from current conditions.	Makah hunters, other participants, protesters, and bystanders would be at risk of injury from weapons, protest activities, or boating accidents during the winter and spring. Increased potential for hunt-related injury falls disproportionately on tribal members (but risk is voluntarily assumed by the Tribe).	The risk of injury from protest activities would be similar to Alternative 2. Limiting hunting to offshore marine waters would result in less risk of weapon-related injuries to bystanders on shore. However, boating accidents and weapon-related injuries for persons associated with the hunt could increase given the less favorable weather and sea conditions off shore.	Less than Alternatives 2 and 3 because of fewer hunting days and weapons discharges plus the ability to hunt during summer months (with more favorable weather and ocean conditions) would decrease the potential of injury from weapons and boating accidents. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Less than Alternatives 2 and 3 because of fewer hunting days and weapons discharges. Effects would be the same as the No-action Alternative during years of hunt hiatus.	Similar to Alternative 2, although slightly less risk because of fewer weapons discharges.	Less than Alternatives 2, 3, and 6 because of fewer hunting days and weapons discharges, but greater than Alternatives 4 and 5. Hunts during the summer/fall hunt seasons with more favorable weather and ocean conditions would further decrease the potential from weapons and boating accidents on those days.	All action alternatives are likely to increase the risk of adverse impacts because of injury from weapons, boating accidents, and land-based protest activities. Alternative 2 would likely have the most impact, while Alternative 4would likely have the least impact.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
HUMAN HEALTH	**Nutritional Benefits, Environmental Contaminants, and Exposure to Food-borne Pathogens**	No change from current conditions.	Insufficient information about nutritional value and contaminant levels in current Makah diet to predict the precise changes in exposure to contaminants or food-borne pathogens or the nutritional composition of the Makah diet if tribal members have the opportunity to consume freshly harvested whale. However, whale products, in particular blubber, could contain higher levels of certain contaminants.	Same lack of information as noted for Alternative 2. Nutritional benefits and contaminant exposure would be similar to Alternative 2 given the similar number of whales likely to be harvested each year.	Same lack of information as noted for Alternative 2. Nutritional benefits and contaminant exposure would be less than Alternatives 2 and 3 given the lower number of whales likely to be harvested each year.	Similar to Alternative 4 given the potentially lower number of whales likely to be harvested each year.	Similar to Alternative 2.	Same lack of information as noted for Alternative 2. Nutritional benefits and contaminant exposure would be less than Alternatives 2, 3, and 6 but greater than Alternatives 4 and 5 given the expected number of whales harvested each year.	All action alternatives are likely to have a mix of beneficial and adverse impacts associated with nutritional benefits, environmental contaminants, and exposure to food-borne pathogens. Alternative 2 would have the greatest likelihood of mixed impacts, while Alternative 4 would have the least.

Resources		Alternative 1 No-action	Alternative 2 Tribe's Proposed Action	Alternative 3 Offshore Hunt	Alternative 4 Summer/Fall Hunt	Alternative 5 Split-season Hunt	Alternative 6 Different Limits on Strikes and PCFG Whales, and Limited Duration of Regulations and Permits	Alternative 7 Composite Alternative (Preferred)	Impact Relative to No-action Alternative
NATIONAL AND INTERNATIONAL REGULATORY ENVIRONMENT	**Marine Mammals Nationally**	It is uncertain, but possible, that a decision not to authorize a Makah whale hunt could discourage future requests for a waiver of the MMPA.	Authorizing a Makah hunt may prompt other requests by Indian tribes for a similar waiver of the MMPA. The outcome of future requests would depend on the specific facts presented.	Similar to Alternative 2.	Similar to Alternatives 2 and 3.	Similar to Alternatives 2-4.	Similar to Alternatives 2-5.	Similar to Alternatives 2-6.	It is uncertain what, if any, impacts the action alternatives are likely to have on the national regulatory environment for marine mammals.
	Worldwide Whaling	A U.S. decision not to authorize a Makah whale hunt is unlikely to influence the position of the United States or other countries regarding IWC issues.	It is unlikely that authorizing a Makah hunt would increase whaling worldwide by emboldening pro-whaling countries.	Similar to Alternative 2.	Similar to Alternatives 2 and 3.	Similar to Alternatives 2-4.	Similar to Alternatives 2-5.	Similar to Alternatives 2-6.	It is uncertain what, if any, impacts the action alternatives are likely to have on worldwide whaling.

LIST OF FIGURES

5.0 CUMULATIVE EFFECTS

5.1 Background

5.1.1 Context for Analysis

NEPA defines cumulative impact as "the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions, regardless of what agency (federal or non-federal) or person undertakes such other actions" (40 CFR 1508.7). Section 3, Affected Environment, describes the current status of each resource, which reflects the effects of past and current actions. Section 4, Environmental Consequences, evaluates the effects of the Makah Tribe's proposed hunt and the alternative actions on the current status of each resource. This section now considers the cumulative effects of each alternative on each resource in the context of the effects of past actions, current conditions, and reasonably foreseeable future actions and conditions.

5.1.2 Geographical Area and Temporal Scope for Analysis

The Environmental Protection Agency (EPA 1999) makes the following recommendations regarding the geographical area of cumulative impact analyses:

- Geographic boundaries used in cumulative impact analysis should be based on all resources of concern and all of the actions that may contribute, along with the project effects, to cumulative impacts.
- Generally, the scope of analysis will be broader than the scope of analysis used in assessing direct or indirect effects.
- The proper spatial scope of the analysis should include geographic areas that sustain the resources of concern. Importantly, the geographical boundaries should not be extended to the point that the analysis becomes unwieldy and useless for decision-making.
- In many cases, the analysis should use an ecological region boundary that focuses on the natural units that constitute the resources of concern.

Separate guidance by the Council on Environmental Quality (CEQ 1997) notes the following steps for determining the appropriate area for the analysis of cumulative impacts:

1. Determine the area that will be affected by the proposed action; CEQ refers to this area as a "project impact zone."
2. Identify the resources within that zone that could be affected by the proposed action.

3. Determine the geographic areas occupied by those resources outside of the project impact zone. In most cases, the largest of these areas will be the appropriate area for the analysis of cumulative impacts.

4. Determine the affected institutional jurisdictions, both for the proposing agency and other agencies or groups.

The CEQ guidance also suggests that for migratory wildlife (e.g., gray whales), possible areas that could be used in a cumulative impact analysis could include breeding grounds, migration routes, wintering areas, or the total range of affected population units.

As described in Section 1, Purpose and Need, and Section 2, Alternatives, the action alternatives would restrict gray whale hunts to the coastal portion of the Makah Tribe's U&A situated within the larger action area defined as the entire U&A and adjacent marine waters and land areas (refer to Figure 1-1). In accordance with CEQ guidance, we consider this larger area to be the project impact zone (referred to in this FEIS as "action area"). The resources within the action area that could be affected by the proposed action are those addressed in Section 3, Affected Environment. Most are found within the action area, but some resources (e.g., gray whales and ships) are highly mobile and occupy areas outside of that area. After reviewing guidance by the CEQ (1997) and EPA (1999) and the alternatives and resources addressed in this FEIS, we believe that the geographic area best suited for analyzing cumulative impacts consists of the entire range of the ENP stock, from the Arctic to Mexico. This area contains essential breeding, feeding, and migration habitats for the ENP stock of gray whales (which the Tribe proposes to hunt), as well as the PCFG whales that are a key resource of interest in this FEIS. Within this area, there are a wide range of activities that affect gray whales, ranging from site-specific impacts like ship strikes to large-scale impacts like climate change. In our analysis of cumulative impacts, we discuss possible effects on WNP whales where appropriate; however, we did not include the Western North Pacific in our analysis area because it is not within the primary range of ENP whales that are the focus of the proposed action and action alternatives.

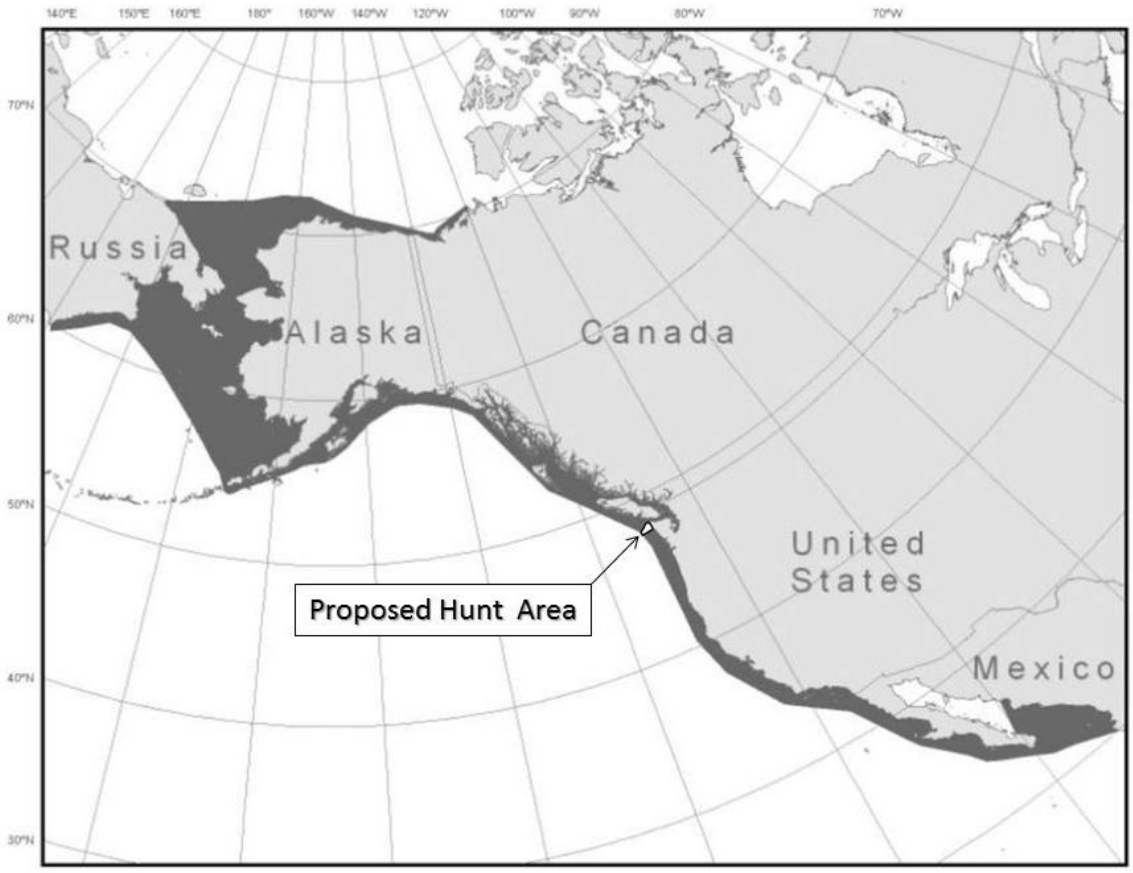

Figure 5-1. Analysis area (dark shading) for cumulative impacts relative to the proposed hunt area/project area. Adapted from Carretta et al. (2014).

To determine the temporal scope of our cumulative impact analysis, we reviewed guidance by the CEQ (1997) that notes the appropriate time frame should account for how far into the future the effects of the proposed action are projected to last. Similarly, guidance by the EPA (1999) notes that the most common temporal scope is the life of the project and that the analysis "should extend until the resource has recovered from the impact of the proposed action." We believe that it is not appropriate to limit our cumulative impact analysis to a specific time frame because the proposed action (and all but one of the other action alternatives) would have impacts for an indefinite period of time. Gray whales are long-lived animals and take 6 to 12 years to mature (Subsection 3.4.3.1.5, Reproduction and Calf Production), so it may take a long time to detect if the proposed action or action alternatives are affecting gray whales as expected under current harvest models (Subsection 3.4.3.4.4, PCFG Status, Carrying Capacity, and Related Estimates, IWC Implementation Review of PCFG Gray Whales). Thus, we believe it is important to consider whether removing even a few animals per year (especially over an extended period of time) from the relatively small PCFG could have long-lasting impacts, therefore, we recognize

the long-term nature of the proposed action and its potential effects by acknowledging and considering them into the future.

5.1.3 Past, Present, and Reasonably Foreseeable Future Actions

Relevant past and present actions are those that have influenced the current condition of the resource. For the purposes of this FEIS, past and present actions include both human-controlled events (such as subsistence harvest and commercial fisheries) and natural events (such as climate change) that also can be influenced by human activity. The cumulative impact analysis relies on the descriptions of current conditions (based on past and present actions) presented in Section 3, Affected Environment.

Reasonably foreseeable future actions are those that (1) have already been or are in the process of being funded or permitted, (2) are described or included as priorities in government planning documents, or (3) are likely to occur or continue based on traditional or past patterns of activity. Our analysis considers both human and natural actions that are occurring in the affected environment and affecting the same resources as the proposed action and alternatives. Reasonably foreseeable future actions considered must also fall into the temporal and geographic scope described in Subsection 5.1.2, Geographical Area and Temporal Scope for Analysis.

Reasonably foreseeable future actions were identified from scoping for this EIS and the large body of information used to develop Section, 3 Affected Environment, with particular attention given to those actions likely to affect gray whales. We determined that the following actions should be addressed in our cumulative impact analysis: harvest of gray whales, shipping, military exercises, fisheries, tourism, marine energy and mining projects, scientific research, natural mortality, climate change, and U.S. government policy. Table 5-1 compares those actions with past and present actions, Subsections 5.1.3.1 through 5.1.3.10 describe each action's impacts and its relevance to our analysis, and Figures 5-2 and 5-3 show the location of several of these actions (i.e., those with available geographic data) relative to the analysis area and the proposed hunt area/action area.

Table 5-1. Past, present, and reasonably foreseeable future actions considered in the cumulative impact analysis.

Action	Past and Present	Reasonably Foreseeable Future
Harvest	Subsistence and commercial harvest	Subsistence harvest
Shipping	Shipping and liquefied natural gas terminals	Shipping and liquefied natural gas terminals

Military Exercises	Naval testing and training	Naval testing and training
Fisheries	Pot and net fisheries	Pot and net fisheries
Tourism	Whale watching	Whale watching
Marine Energy and Mining Projects	Oil and gas exploration and extraction, and mineral and salt mining	Oil and gas exploration and extraction, mineral and salt mining, and wave and tidal energy projects, offshore wind energy
Scientific Research	Biological and oceanographic surveys	Biological and oceanographic surveys
Natural Mortality	Predation, disease, and starvation	Predation, disease, and starvation
Climate Change and Ocean Acidification	Global warming and ocean acidification	Global warming and ocean acidification
U.S. Government Policy	Past government policies discouraging or forbidding some cultural practices, including those related to whaling	Maintenance of Treaty between the U.S. and Makah Tribe

5.1.3.1 Harvest

Aboriginal hunters in the North Pacific have harvested gray whales for more than a thousand years (Krupnik 1984; O'Leary 1984). Details and issues related to past and present aboriginal harvest of gray whales can be found in the following subsections of this FEIS:

- 1.2.4.1.3, IWC Aboriginal Subsistence Whaling
- 1.4.1, Summary of Aboriginal Subsistence Whaling Catch Limits
- 3.4.3.3.4, ENP Status, Carrying Capacity, and Related Estimates
- 3.4.3.6.1, Aboriginal Subsistence Whaling
- 4.1.1.3, Potential Number of ENP and PCFG Whales Killed; Likelihood of Striking a WNP Whale; Likely Number of Whales Harvested
- 4.17, Regulatory Environment Governing Harvest of Marine Mammals

Since 2004, the IWC Schedule has read as follows for the ENP gray whale stock catch limit:

> [T]he taking of gray whales from the Eastern stock in the North Pacific is permitted, but only by aborigines or a Contracting Government on behalf of aborigines, and then only when the meat and products of such whales are to be used exclusively for local consumption by the aborigines (IWC Schedule 2005 and subsequent years, paragraph 13(b)(2)).

Paragraph 13(b) of the current Schedule (IWC 2022a) sets catch limits for 2018 through 2025. Paragraph 13(b)(2) sets a catch limit of 980 ENP gray whales that is limited to 140 whales per year (reviewable annually by the IWC and its Scientific Committee). The annual catch limit (as

conveyed in the Schedule) has stayed the same since 1998. During the past three Schedule cycles when the Makah Tribe has not been able to harvest whales, the Chukotkans have harvested them instead (Subsection 4.1.1.3, Potential Number of ENP and PCFG Whales Killed; Likelihood of Striking a WNP Whale; Likely Number of Whales Harvested). Given these considerations, we conclude that gray whales will continue to be harvested in aboriginal subsistence hunts at current or very similar levels with oversight by the IWC. We conclude that subsistence harvest of ENP gray whales at current levels, with close oversight by the IWC, is a reasonably foreseeable future action in the Chukotkan region (and possibly in the coastal portion of the Makah U&A if NMFS were to complete the actions described in Subsection 1.1.1, Summary of the Proposed Action) (Figure 5-2) that will continue to impact gray whales. Under Alternatives 6 and 7, the waiver would expire after 10 years. It is likely that the Makah Tribe would pursue another waiver, and possible that NMFS may issue such a waiver if the Tribe were to request it. In that case, the IWC and its Scientific Committee would continue to set and review the catch limit and oversee the humaneness of the hunt.

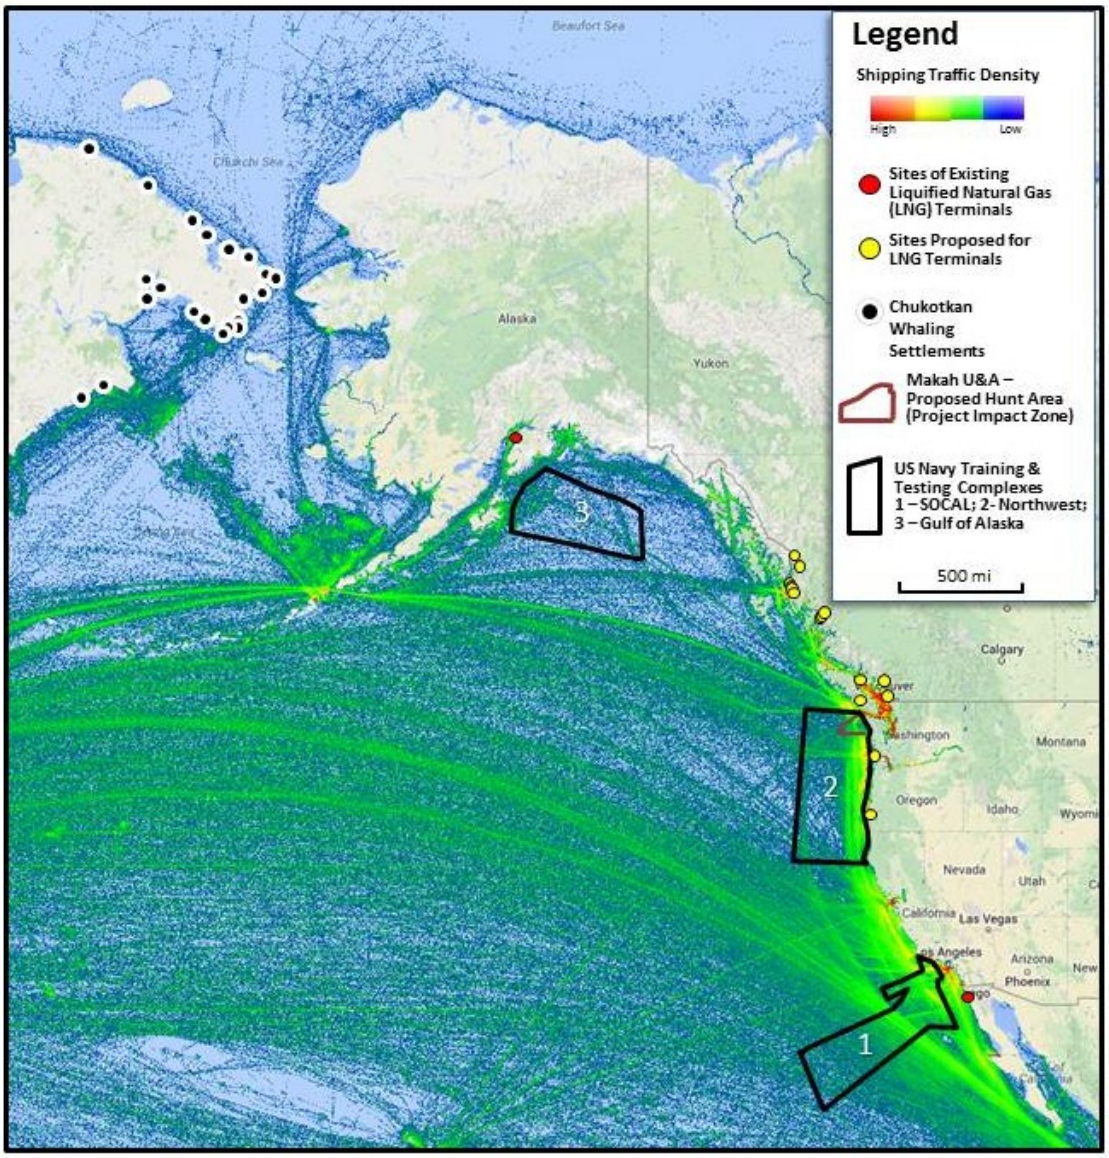

Figure 5-2. Location of the proposed hunt area relative to shipping traffic, LNG terminals, Chukotkan whaling settlements, and U.S. Navy training and testing complexes. [1]

5.1.3.2 Shipping

Details and issues related to past and present shipping effects can be found in the following subsections of this FEIS:

- 3.2.6, Spill Prevention
- 3.4.3.6.4, Oil Spills and Discharges
- 3.4.3.6.11, Climate Change and Ocean Acidification
- 3.6.3.1.4, Commercial Shipping

[1] Data layer sources: Shipping (https://www.marinetraffic.com/); LNG terminals (LNG in BC 2014; US Department of Energy 2014); Chukotkan whaling settlements (Borodin et al. 2012); US Navy Training and Testing Area (U.S. Navy 2013, 2014a, 2014b).

- 3.11.3.2.2, Marine Noise

Figure 5-2 displays the tracks of recent shipping traffic in the analysis area. Shipping traffic is concentrated in the nearshore zone used by migrating and traveling gray whales. The highest traffic densities are associated with the following coastal ports and interior waters (south to north): Guerrero Negro (Baja Mexico); Long Beach and San Francisco Bay ports (California); Columbia River and inland ports (Oregon and Washington); Strait of Juan de Fuca and Puget Sound ports (Washington); Georgia Basin ports including Vancouver and Victoria, as well as Port Hardy and Prince Rupert (British Columbia, Canada); and Anchorage/Nikiski, Akutan/Dutch Harbor, and Nome (Alaska). Effects on gray whales from shipping include ship strikes, noise, and spills. In our most recent stock assessment report (Carretta et al. 2023), we determined that, from 2014 to 2018, the total serious injury and mortality of ENP gray whales attributed to ship strikes is nine animals (including seven deaths) or 1.8 whales per year; For whales in the PCFG range and season during this same period, it is three animals, or 0.6 whale per year. Additional mortality from ship strikes probably goes unreported because stranded whales may not have obvious signs of trauma or struck whales do not strand or strand where they are not observed.

The number of containers moving through major North American ports was up over 4 percent in the first half of 2014 (Journal of Commerce 2014). The projected growth of shipping into Puget Sound will increase the number of container ships traversing the Makah U&A, including the Strait of Juan de Fuca. Approximately 4,400 to 4,800 vessels annually traversed the Strait of Juan de Fuca from 2010 to 2021 (Subsection 3.13.3.2.2, Offshore Vessel Transits). The Washington Ports Association projects a 4 percent annual growth rate of container shipping into Puget Sound through 2025 (BST Associates 2004). A recent vessel traffic study for Puget Sound and the Washington coast projects a similar steady rise in shipping through 2030, with much of that traffic attributed to large, dry bulk freighters and container ships transiting the Strait of Juan de Fuca.[2] Container ships in the Strait are controlled by the Coast Guard's vessel separation scheme (Subsection 3.6.3.1.4, Commercial Shipping). Although none of the alternatives would allow the Makah Tribe to hunt in the Strait of Juan de Fuca portion of their U&A, some hunt-related vessel activity can be expected in that area (Subsection 1.4.2, Summary of Recent Makah Whaling – 1998 through 2007) and it would, therefore, be added to a volume of vessel traffic that is projected to increase in the future.

While most shipping routes are well established, it is difficult to project the future of shipping coast wide because of uncertain future fuel prices and the limits on future capacity of west coast

[2] This study was prepared in support of a May 2014 draft EIS addressing the operation of the North Wing of the BP Cherry Point Marine Terminal dock located in northern Puget Sound (U.S. Army Corps of Engineers 2014).

ports to accommodate increased volumes (White 2008). New shipping routes could be established in the Arctic if the extent and duration of ice cover continues to decrease. However, sea ice conditions are highly variable, and major uncertainties regarding the predictability and safety of navigational pathways (Wilson et al. 2004) suggest that significant investments would be needed before a trans-Arctic passage could reliably be used (Ho 2010).

Future shipping levels could also be affected by an increase in liquefied natural gas (LNG) facilities within or adjacent to areas inhabited by gray whales along the west coast. Presently, there is one LNG export (liquefaction) terminal located near Kenai, Alaska and one import (regasification) terminal near Ensenada, Mexico. Information compiled by the California Energy Commission (2010) indicates that at least ten LNG terminals were being considered for construction in California, Oregon, Washington, and British Columbia in recent years. The operation of such terminals would increase large tanker shipping in the analysis area, and LNG tankers could encounter gray whales while transiting to and from terminals. The Federal Energy Regulatory Commission (FERC) is responsible for authorizing the siting and construction of onshore and nearshore LNG import or export facilities. As of February 2022, the U.S. Department of Energy (2022) had identified one approved LNG terminal that has yet to be built (an export terminal in Nikiski, Alaska) in the U.S. portion of the analysis area. There is also one proposed export terminal in Baja, Mexico. In British Columbia, there are currently 16 proposed LNG projects primarily near Vancouver and Prince Rupert (LNG in BC 2014) (Figure 5-2).

It is difficult to predict the number and location of LNG facilities that will actually be built within the cumulative effects analysis area. In addition to a rigorous review process, many LNG projects (e.g., Oregon's Bradwood Landing and California's Clearwater Port projects) face significant local opposition as has been witnessed in the Pacific Northwest and California or are abandoned during the development stages for various reasons. Market forces will likely continue to dictate the number of facilities constructed in North America, and a shift to renewable energy resources may reduce dependence on LNG over time.

We conclude that shipping is a reasonably foreseeable future action that will likely increase, leading to increased impacts to gray whales (most likely resulting from vessel strikes and pollution from spills), especially from southern Alaska to Mexico, but potentially in the Arctic if shipping traffic expands into those waters.

5.1.3.3 Military Exercises

The cumulative effects analysis area includes waters from Russia to Mexico (Figure 5-1), which are traversed by naval vessels from many countries. Naval vessels represent a minute fraction of all vessel traffic in the analysis area and are unlikely to have more than a negligible effect on ENP

gray whales when transiting (Subsection 5.1.3.2, Shipping). Military training and testing exercises, however, could affect ENP gray whales because of whales being exposed to explosions, projectiles, and underwater noises. Countries that may regularly engage in training and testing activities in the analysis area include the United States, Canada, Mexico, and Russia.

The U.S. Navy has operated regularly in the ENP since 1841. Most naval facilities within or adjacent to the analysis area are located in San Diego (main homeport of the Pacific Fleet) and Puget Sound (home to the third largest fleet concentration in the United States). The analysis area encompasses naval operations off the coasts of California, Oregon, Washington, and Alaska. Training and testing in the coastal waters of the ENP currently occurs primarily in three complexes that overlap with the gray whale range (Figure 5-2): Southern California Range (SOCAL) Complex,[3] Northwest Training Range Complex (Washington), and Gulf of Alaska Training Area. In addition, the Navy may conduct training and testing exercises in the coastal waters of other countries through "Rim of the Pacific" (RIMPAC) military exercises (Sorenson 2014).

Effects of past and current naval activities on gray whales are reflected in the current condition of the whales, which is described in Subsection 3.4.3, Gray Whales – Existing Conditions. Where naval exercises are expected to continue as they have in the past, we expect there would be no new or additional effects on gray whales. Although the Navy frequently modifies its testing and training activities as needed to evaluate new technologies or emerging threats, such modifications do not necessarily result in substantive changes in effects on gray whales. Regardless, NMFS actively consults with the Navy on military exercises throughout the ENP and provides biological analyses, mitigation measures, and permits, as warranted, to minimize take of marine mammals and ESA-listed species. The discussion below addresses the three Navy complexes within our analysis area for cumulative impact analysis.

SOCAL Range Complex: The Navy's SOCAL Range Complex is situated between Dana Point and San Diego, California, and extends more than 600 nm (1,111 km) southwest into the Pacific Ocean (Figure 5-2), encompassing 120,000 square nm (412,000 square km) of sea space. This area overlaps with the southern portion of the gray whale migration corridor.

Pursuant to a final EIS issued in December 2018 (U.S. Navy 2018), the Navy is currently conducting training and testing in the SOCAL Range Complex for the following activities: anti-air warfare, amphibious warfare, strike warfare, anti-surface warfare, anti-submarine warfare, electronic warfare, mine warfare, and naval special warfare. Details regarding each activity can

[3] The SOCAL Range Complex is one of three complexes in the larger Hawaii-Southern California Training and Testing Study Area.

be found in the Navy's final EIS. In a 2018 Biological Opinion (NMFS 2018b), we reviewed the Navy's activities and determined that takes of marine mammals would likely result from exposure to sound or pressure waves in the water. There is also a chance that bottom feeders like gray whales could ingest small fragments of expended ordnance used in certain training exercises; however, they typically feed in waters shallower than those used in naval exercises. We further concluded that we do not expect any stress responses for gray whales, due to Navy activities, to continue long enough to have fitness consequences for individual animals because these whales are likely to have energy reserves sufficient to meet the demands of their normal behavioral patterns and the additional demands of any stress responses. Therefore, we would not expect gray whales to experience reductions in their annual or lifetime reproductive success as a result of their response to being exposed to active sonar during the training and testing the U.S. Navy plans to conduct in the SOCAL Complex.

In our Biological Opinion (NMFS 2018b), we also noted that the estimates of WNP gray whale exposures to training and testing activities are probably an over-estimate of the actual exposures even if they represent the best estimate available. The few WNP gray whales that may be exposed to naval activities in the SOCAL Complex would only be exposed periodically or episodically, if at all (especially during the summer months when they would be expected to be foraging in WNP waters). We concluded that the Navy's training and testing activities are not likely to adversely affect the population dynamics, behavioral ecology, and social dynamics of individual WNP gray whales in ways or to a degree that would reduce their fitness. We also noted that an action that is not likely to reduce the fitness of individual whales would not be likely to reduce the viability of the populations those individual whales represent (that is, we would not expect reductions in the reproduction, numbers, or distribution of those populations). As a result, the activities the U.S. Navy plans to conduct in the SOCAL Complex would not appreciably reduce the WNP gray whales' likelihood of surviving and recovering in the wild.

In July 2020, we issued an extension of the MMPA letters of authorization (85 FR 41780, July 10, 2020) to the Navy for training and testing activities in the SOCAL Complex during the 5-year period from 2018 to 2023 that allow for the following amounts of harassment[4] to be allowable for an additional two years, through 2025:

[4] Under the 1994 Amendments to the MMPA, harassment is statutorily defined for military readiness activities as any act of pursuit, torment, or annoyance which — (Level A Harassment) injures or has the significant potential to injure a marine mammal or marine mammal stock in the wild, or (Level B Harassment) disturbs or is likely to disturb a marine mammal or marine mammal stock in the wild by causing disruption of natural behavioral patterns, including, but not limited to, migration, surfacing, nursing, breeding, feeding, or sheltering to the point where such behavioral patterns are abandoned or significantly altered.

- ENP gray whales = 27 Level A harassments and 16,703 Level B harassments
- WNP gray whales = 0 Level A harassments and 19 Level B harassments

As part of our authorization, the Navy is also required to invoke various mitigation measures, including lookouts, mitigation zones, and a stranding response plan.

Northwest Training Range Complex (NWTR Complex): The Navy's NWTR Complex includes an area extending 250 nm (463 km) westward from the coasts of Washington, Oregon, and Northern California and encompassing 122,440 square nm (420 square km) (Figure 5-2) (U.S. Navy 2014a). This area overlaps with portions of the ENP migration corridor, the PCFG range, and the coastal portion of the Makah U&A where the Tribe proposes to hunt ENP gray whales.

Pursuant to a final Supplemental EIS issued in September 2020 (U.S. Navy 2020), the Navy is currently conducting training and testing in the NWTR Range Complex for an indefinite period of time but will review its compliance with NEPA and other laws approximately every 5 years for substantive changes and to update/renew permits from regulatory agencies as necessary. The Navy EIS evaluates a number of activities related to training, testing, research, development, and evaluation. Details regarding each activity can be found in the Navy's final Supplemental EIS.

Navy acoustic modeling predicts there would be a highly variable number of events per year (from a few to several thousand) where gray whales could be exposed to sound that may result in a short-term (temporary) change in hearing because of stress on auditory tissues from exposure to high-intensity sound. Recovery may occur within minutes, hours, or days and is not considered injurious. Therefore, the Navy concludes that long-term consequences would not be expected on individual gray whales or the ENP and WNP stocks overall. The Navy also notes that it does not anticipate encountering WNP gray whales during training or testing activities, as their presence is very rare in the study area.

In our 2020 Biological Opinion related to the naval activities in the NWTR Complex (NMFS 2020a), we determined that takes of marine mammals would likely result from exposure to sound or pressure waves in the water or interactions with vessels, projectiles, or expended materials. However, due the small population size and limited number of sightings off the U.S. west coast, we concluded that the potential for any stressor to cause an effect to WNP gray whales was extremely unlikely and that the proposed action was therefore not likely to adversely affect WNP gray whales. Our analysis also did not identify situations where the proposed training activities are likely to indirectly affect other ESA-listed baleen whales, including humpback, fin, blue, and sei whales by disrupting marine food chains or by adversely affecting the predators, competitors, or forage base of endangered or threatened species. In addition, we concluded that endangered or

threatened individuals that are likely to be exposed to the Navy's activities in the NWTR Complex are not likely to experience reductions in fitness.

In light of the expected impacts on other whale species analyzed in that Biological Opinion, it is reasonable to conclude that any stress responses or disruptions of normal behavior patterns of ENP gray whales would not continue long enough to have fitness consequences for individual animals because these whales are likely to have energy reserves sufficient to meet the demands of their normal behavioral patterns and the additional demands of any stress responses. Therefore, we would not expect gray whales to experience reductions in their annual or lifetime reproductive success as a result of their response to being exposed to naval training activities in the NWTR Complex. Also, given the offshore location of most of the naval activities, we do not expect bottom feeders like gray whales to ingest small fragments of expended ordnance used in certain training exercises because they would typically feed in waters shallower than those used in naval exercises. The few WNP gray whales that may be exposed to naval activities in the NWTR Complex would only be exposed periodically or episodically, if at all (especially during the summer months when they would be expected to be foraging in WNP waters).

In November 2020, we issued an MMPA letter of authorization (85 FR 72312, November 12, 2020) to the Navy for training activities in the NWTR Complex during the 7-year period November 9, 2020 to November 8, 2027. This authorized:

- ENP gray whales = 0 Level A harassments and 10 Level B harassments
- No Level A or B harassments for WNP gray whales.

As part of our authorization, the Navy is also required to invoke various mitigation measures, including personnel training and lookouts/surveillance (including visual and aural monitoring).

Gulf of Alaska Range Complex (GOA Complex): The Navy's GOA Complex includes a Temporary Maritime Activities Area (TMAA) that is established in conjunction with the Federal Aviation Administration (FAA) for up to 14 days per year to support the Navy's "Northern Edge" training exercise. The TMAA is a surface, undersea space, and airspace maneuver area within the GOA for ships, submarines, and aircraft to conduct required training activities. As depicted in Figure 5-2, the TMAA is a roughly rectangular area oriented from northwest to southeast, approximately 300 nm (556 km) in length by 150 nm (278 km) in width, located south of Prince William Sound and east of Kodiak Island. With the exception of Cape Cleare on Montague Island located over 12 nm (22 km) from the northern point of the TMAA, the nearest shoreline (Kenai Peninsula) is located approximately 24 nm (44 km) north of the TMAA's northern boundary. This area overlaps with the northern portion of the gray whale migration corridor and is near

areas where some gray whales are known to feed during the summer (Subsection 3.4.3.1.4, Feeding Ecology and Role in the Marine Ecosystem).

The Navy issued a final Supplemental EIS in September 2022 (U.S. Navy 2022) that analyzes the potential environmental effects that may result from (1) ongoing naval training activities (one joint force exercise occurring over a maximum time period of 14 days during summer months [April through October]) and (2) proposed naval training activities associated with conducting two large-scale joint force exercises, including anti-submarine warfare activities and the use of active sonar. These exercises would each last up to 21 days during a focused exercise period; outside of that activity period (i.e., during the other 46 to 49 weeks of the year), the Navy does not train within the TMAA or other areas of the GOA Complex. Activities associated with these exercises include: anti-air warfare, strike warfare, anti-surface warfare, anti-submarine warfare, electronic warfare, mine warfare, and naval special warfare. Details regarding each activity can be found in the Navy's final Supplemental EIS.

In our Biological Opinion related to the Navy's activities in the GOA Complex (NMFS 2022b), we determined that takes of marine mammals would likely result from exposure to sound or pressure waves in the water. Due to the very rare occurrence of WNP gray whales in Alaska and the extremely unlikely overlap of Navy activities with the DPS in the action area, we concluded that the effects of the proposed action were discountable and the action is, therefore, not likely to adversely affect WNP gray whales. Even so, in light of the expected impacts on other whale species analyzed in that Biological Opinion, it is reasonable to conclude that any stress responses or disruptions of normal behavior patterns of ENP gray whales would not continue long enough to have fitness consequences for individual animals because these whales are likely to have energy reserves sufficient to meet the demands of their normal behavioral patterns and the additional demands of any stress responses. Therefore, we would not expect gray whales to experience reductions in their annual or lifetime reproductive success as a result of their response to being exposed to naval training activities in the GOA Complex. Given the offshore location of the GOA Complex, we do not expect bottom feeders like gray whales to ingest small fragments of expended ordnance used in certain training exercises because they would typically feed in waters shallower than those used during naval exercises. The few WNP gray whales that may be exposed to naval activities in the GOA Complex would only be exposed periodically or episodically, if at all (especially during the summer months when they would be expected to be foraging in the WNP).

In January 2023, we issued a finale rule to issue an MMPA letter of authorization (88 FR 604 January 4, 2023) to the Navy for training activities in the GOA Complex during a 7-year period that allows for:

- ENP gray whales = 0 Level A harassments and 28 Level B harassments

No authorization was issued for WNP gray whales. As part of our authorization, the Navy would also be required to invoke various mitigation measures, including personnel training and lookouts/surveillance (including visual and aural monitoring).

In Canada, Maritime Forces Pacific (MARPAC) is responsible for the fleet training and operational readiness of the Royal Canadian Navy in the Pacific Ocean. The MARPAC headquarters and homeport is located in Esquimalt at the southern tip of Vancouver Island on the Strait of Juan de Fuca. We could not find information detailing the types of training or testing that MARPAC conducts in our analysis area. However, news accounts in 2012 reported that the Royal Canadian Navy had been conducting sonar and small underwater explosive activities off southern Vancouver Island. Statements from the Royal Canadian Navy in 2014 underscored that all vessels are to follow a Marine Mammal Mitigation Policy when using sonar and detonating charges, "which includes (but is not limited to) a visual surveillance of the area by watch officers and lookouts, monitoring of passive systems as a means to detect marine mammals as well as the use of a mitigation zone which will cease operations if marine mammals come within a certain range" (Vancouver Sun 2012). A review of marine mammal mitigation measures used by various countries when conducting naval exercises noted that the Royal Canadian Navy designates a 1 nautical mile (1.85 km) 'safety zone' within which real-time mitigation measures are implemented if baleen whales are detected (Dolman et al. 2009).

In part because of rapidly changing Arctic ice conditions, the U.S. Navy produced an "Arctic Roadmap" report for 2014 to 2030 (U.S. Navy 2014c) that forecasts the following:

> In the coming decades, the Arctic Ocean will be increasingly accessible and more broadly used by Arctic and non-Arctic nations seeking the Region's abundant resources and trade routes. Due to the significant retreat of sea ice, previously unreachable areas have started to open for maritime use several weeks each year. The predicted rise in oil and gas development, fishing, tourism, and mineral mining could alter the Region's strategic importance as Arctic and non-Arctic nations make investments.

Although this report does not identify specific areas and training or testing exercises, it does acknowledge that the Navy will need to conduct such exercises in harsh Arctic conditions, likely in conjunction with other countries such as Canada. The report also underscores that at-sea

training and testing activities will need to comply with environmental laws such as the MMPA, ESA, and NEPA. In January 2019, the Navy produced a Strategic Outlook for the Arctic (U.S. Navy 2019) which supersedes the 2014 Roadmap but remains consistent in the stated mission, challenges, and changing environmental conditions in the Arctic region.

Other portions of the analysis area in the Arctic are under the jurisdiction of the Russian Federation. While we were not able to obtain details on that country's military-related plans in waters occupied by gray whales, a recent "Foundations of the State Policy of the Russian Federation in the Arctic for the Period Until 2020 and Beyond" (2009) notes that two of the strategic priorities in the Arctic are:

- Military security—defense and protection of the state border lying in the Arctic zone of the Russian Federation, including maintenance of a necessary fighting potential of the Armed Forces of the Russian Federation.
- Environmental security—preservation and maintenance of the Arctic environment, especially with respect to ecological consequences of increasing economic activities and global changes of climate.

We were also not able to obtain information about specific military training activities or plans by the Mexican Navy. However, the United States has recently been expanding assistance to training the Mexican Navy and other armed forces, and Mexico regularly participates in "Rim of the Pacific" (RIMPAC) military exercises with the United States and other countries' Navies (Sorenson 2014). Recently, ships from Canada, Mexico, and the United States conducted joint operations off the coast of Southern California in support of the North American Maritime Security Initiative (U.S. Indo-Pacific Command 2021). Most Mexican Navy exercises in the range of gray whales seem to focus on using small naval ships for search and rescue operations or drug interdiction (Young 2011).

We conclude that military exercises are a reasonably foreseeable future action that will continue to impact gray whales (most likely the result of vessel strikes and noise impacts), especially in the localized but large testing and training complexes in the ENP. Most military exercises are likely to continue as they have in the past, with some unknown but usually minimal variation in intensity and equipment/technology. Activities may increase in the Arctic, but the extent of this increase is unknown.

5.1.3.4 Fisheries

Details and issues related to past and present fisheries effects can be found in the following subsections of this DEIS:

- 3.4.3.1.7, Strandings
- 3.4.3.6.9, Incidental Catch in Commercial Fisheries

Commercial fisheries have been harvesting a variety of finfish and shellfish along the west coast since the 1800s (e.g., Alaska Marine Conservation Council 2005; Dahlstrom and Wild 1983). Most gray whale entanglements seem to be associated with west coast crab and shrimp fisheries that typically employ a cage-like "pot" set on the ocean bottom and tethered by rope to a floating buoy on the surface. Dungeness crab are the primary species targeted in the Pacific Northwest and commercial crab fishing areas occupy a nearly continuous band of nearshore waters from Eureka, California north to Destruction Island off the central Washington coast (Johnson et al. 1986). Over 1,200 persons engage in this fishery in Washington, Oregon, and California. Canadian fishermen also harvest Dungeness crab and the Canadian Department of Fisheries and Oceans (DFO Canada 2013) reports that 27 licenses were issued and 350 traps deployed in 2010 to 2012 off the west coast of Vancouver Island (Area E) (DFO Canada 2012b). In Alaska, there are seven crab species of commercial importance, with fisheries extending from the Northern Bering Sea to Southeast Alaska (Alaska Department of Fish and Game 2014). King and snow crab are the primary species harvested, with the latter making up nearly 75 percent of the Alaska crab landings in 2021 (NMFS 2021b). In the most recent ENP gray whale stock assessment report (Carretta et al. 2023), gray whales were reported with rope and crab pot gear wrapped around or cutting into their body (often the caudal peduncle, flipper, or mouth). Some animals were free swimming while others were dead or in a poor, emaciated condition.

In addition to encounters with crab fisheries, other fisheries known to entangle gray whales include longline, gillnet, and seine fisheries, with the latter two net fisheries accounting for most mortality from these gear types (Baird et al. 2002). Some employ long nets (e.g., drift gillnets) that hang for hours in the water column and can ensnare gray whales. The most recent ENP gray whale stock assessment report (Carretta et al. 2023) records five reported entanglements of gray whales in the California drift gillnet fishery for swordfish and thresher shark from 1990 to 2018. The estimated bycatch for this fishery is 0.52 gray whales per year (Carretta et al. 2023). Alaska gillnet fisheries also interact with gray whales; however, those fisheries have lower observer coverage, making it more difficult to estimate a bycatch rate. As described in Subsection 3.4.3.6.9, Incidental Catch in Commercial Fisheries, NMFS observers monitoring the Makah tribal set gillnet fishery from 1990 to 1998 and in 2000, reported one gray whale taken in 1990 and one in 1995. One gray whale was entangled in a set gillnet during the 1995 fishery and was used by the Tribe after it died (NMFS 1995); a whale entangled in the 1996 fishery was released alive (Hill and DeMaster 1998). Another gray whale was found entangled in a tribal set gillnet in 2009 and swam away during disentanglement attempts (Scordino and Mate 2011). In recent

years, this set gillnet fishery has been reduced considerably and is currently restricted to the Strait of Juan de Fuca (Makah Fisheries Management 2012). NMFS observers monitoring the California set gillnet halibut fishery have not observed any entangled gray whales, but there have been recent sightings of free-swimming gray whales entangled in gillnets (Carretta et al. 2023).

On March 21, 2023, we published an updated "List of Fisheries" (88 FR 16899, March 21, 2023) which reviews and classifies commercial fisheries into one of three categories under the MMPA based on the level of mortality and serious injury of marine mammals that occurs incidental to each fishery:

- Category I = frequent incidental mortality and serious injury of marine mammals;
- Category II = occasional incidental mortality and serious injury of marine mammals;
- Category III = a remote likelihood or no known incidental mortality and serious injury of marine mammals.

Gray whales are not identified as an affected species in any Category I fisheries but are identified in the following 14 Category II fisheries:

- California: Dungeness crab pot; spot prawn pot; thresher shark and swordfish drift gillnet; halibut, white seabass and other species set gillnet; coonstripe shrimp pot; spiny lobster; and rock crab pot.
- Oregon: Dungeness crab pot.
- Washington: Coastal Dungeness crab pot.
- Alaska: Yakutat salmon set gillnet; Bristol Bay drift gillnet; Bristol Bay set gillnet; Bering Sea, Aleutian Islands flatfish trawl; and Prince William Sound salmon drift gillnet.

Within the cumulative effects analysis area, research aimed at reducing fisheries impacts on large whales has had notable success in identifying and removing derelict pot gear, especially buoy lines (NMFS 2014b).

In Mexico, the coastal waters off Baja California and the Gulf of California account for 50 to 70 percent of annual fisheries production (Organization for Economic Cooperation and Development 2008). Urban-Ramirez et al. (2003) reported six incidents of gray whale entanglements in Mexico involving passive fishing gear, including gillnet and pot gear. In 2014, a gray whale calf was found entangled in lobster fishing gear in Laguna San Ignacio and a successful disentanglement effort was launched (Martinez-Aguilar 2014). In 2022, a gray whale calf was successfully disentangled from unidentified line and an attached buoy in the same region (Martinez-Aguilar 2022c). These authors noted that data on gray whale entanglements in Russia are not available,

and we were not able to find information regarding such entanglements in the Russian portion of the ENP range.

We conclude that fisheries are a reasonably foreseeable future action that will continue to affect gray whales (most likely the result of vessel strikes and gear entanglements) throughout their range in the ENP.

5.1.3.5 Tourism

Tourism, in particular whale-watching, can have a wide range of effects on gray whales, including increased public awareness, commercial revenues, and vessel and noise related impacts. Details and issues related to past and present whale-watching/tourism effects can be found in the following subsections of this FEIS:

- 3.4.3.5.2, Whale Response to Being Pursued,
- 3.4.3.6.5, Offshore Activities and Underwater Noise,
- 3.4.3.6.6, Vessel Interactions,
- 3.4.3.6.7, Activities Occurring in the Mexican Portion of the Range,
- 3.5.3.3.4, Marine Mammals and Underwater Noise,
- 3.6.3.3.2, Commercial Value of Whales.

As described in Subsection 3.6.3.3.2, Commercial Value of Whales, whale watching is an important tourist activity throughout much of the range of gray whales, especially in the southern/winter portion of the ENP stock. In a study of worldwide whale watching trends, O'Connor et al. (2009) found that, in the ENP, the number of whale watchers had increased from roughly 2.8 million watchers in 1998 to over 3.3 million in 2008. That study also reported that the number of whale watch operators in the ENP (excluding Mexico, for which 1998 data were lacking) had increased from 214 to 233 during the same period. Summarized below is the average annual growth rate (AAGR) of whale watchers reported in that study for each country/state in the ENP, as well as major ports/locales that we could identify with boat-based operations for watching gray whales:

- Mexico: +5.8 percent AAGR (Bahia Magdalena Lagoon complex, Laguna San Ignacio, and Laguna Ojo de Liebre).
- California: -2.5 percent AAGR (Bodega Bay, Crescent City, Eureka, Fort Bragg, Half Moon Bay, Los Angeles vicinity, Monterey, Morro Bay, San Diego, San Francisco, and Santa Barbara).
- Oregon: +7.1 percent AAGR (Brookings, Charleston, Depoe Bay, Garibaldi, and Newport).

- Washington: +3.0 percent AAGR (Anacortes, Bellingham, Friday Harbor, La Push, Neah Bay, Port Angeles, Port Townsend, Seattle, Vashon Island, and Westport).
- British Columbia: +4.2 percent AAGR (Campbell River, Duncan, Port Hardy, Port Renfrew, Prince Rupert, Sidney, Sooke, Tofino, Ucluelet, Vancouver, and Victoria.
- Alaska: +21 percent AAGR (Homer, Kenai, Ketchikan, Kodiak, Seward, Sitka, and Whittier).

Whale watching in Mexico began in the 1970s and has turned into an active and diverse industry, spreading from the lagoons to southern and eastern Baja and the mainland coast (Hoyt and Iñíguez 2008). The majority of whale watching tours in Mexico take place using small boats in the winter, when gray whales congregate in and near lagoons to breed and give birth. Operators in the northern portion of the cumulative effects analysis area (especially the interior waters of the Georgia basin) typically focus on trips to view killer whales, but they also advertise opportunities for viewing other wildlife, including gray whales. Charters focusing on migrating gray whales typically are offered in the spring, while tours to see locally feeding gray whales during the summer feeding period are available from California to Alaska.

We found very little information regarding active whale-watching tours in eastern Russia. O'Connor et al. (2009) noted that there are a few operators offering general nature/ecotour cruises, but data are very limited in this remote region and operations seem to be focused near Kamchatka and the Kuril and Commander Islands in the WNP. Hoyt (2006) recently prepared a guide for companies, conservation groups, and individuals wanting to promote or set up marine ecotours in Russia. That report identifies gray whales as the most common large whale in the Arctic waters of eastern Russian during the summer and autumn. It also goes on to note that there are currently no official marine mammal or whale watch regulations in Russian legislation.

Although whale watching has grown within the analysis area during the past two decades and may continue to grow, some regions have seen a decline or been characterized as "mature" (e.g., California and Oregon), with operators competing for a fixed number of whale watching tourists (O'Connor et al. 2009). If interest in whale watching continues to grow then the number of whale watch operators may also increase. However, the number of operators (in contrast to whale watcher trends reported above) in some regions in the analysis area did not grow (British Columbia) or declined in number (Oregon) between 1998 and 2008 (O'Connor et al. 2009), so it is difficult to predict how much whale watching might grow in the future. Climate change may also affect regional whale watching opportunities (Salvadeo et al. 2013).

As described previously, gray whales are known to change their behavior when pursued by whale-watching boats, including changing course and altering their swimming speed and

respiratory patterns (Subsections 3.4.3.5.2, Whale Response to Being Pursued, and 3.4.3.6.6, Vessel Interactions). Mother-calf pairs of gray whales are considered more sensitive to disturbance by whale-watching vessels than other age or sex classes. In general, scientists remain cautious about drawing conclusions regarding the magnitude of the effects of whale watching on gray whales (Subsection 3.4.3.6.6, Vessel Interactions). Nonetheless, the activity of commercial whale-watching vessels and private recreational boats has raised concerns about its effect on gray whales. In response to these concerns, regulations or guidelines are in place to minimize disturbance by vessels in Mexico, the United States, and Canada. For example, the Mexican government has applied whale-watching regulations to commercial operators since 1997, and there are currently regulations governing the numbers of boats and methods of approach for specific whale-watching areas in the Baja lagoons. In Washington and British Columbia, NMFS and conservation organizations in the United States have teamed up with the Canadian government and conservation organizations to adopt 'Be Whale Wise' guidelines for vessels, kayaks, and other crafts used for watching whales. The guidelines, among other things, recommend that vessels keep a 100-yard buffer between the vessel and the whale and recommend a slow approach speed of 7 knots within 1000 yards of whales (refer to Subsection 3.4.3.6.6, Vessel Interactions). The IWC has compiled a Whale Watching Handbook with a comprehensive list of regulations governing whale watching around the world, as well as a database of scientific literature related to the impacts of whale watching.

We conclude that whale-based tourism is a reasonably foreseeable future action that will continue to impact gray whales (most likely resulting from vessel strikes and behavioral changes) throughout their range in the ENP.

5.1.3.6 Marine Energy and Coastal Development Projects

Past, present, and reasonably foreseeable future oil and gas exploration and development occur near the southern and northern extremes of the range of ENP gray whales. Potential effects include vessel strikes, noise, and pollution. Past and present effects on ENP gray whales are described in Subsection 3.4.3.6.4, Oil Spills and Discharges, Subsection 3.4.3.6.5, Offshore Activities and Underwater Noise, and Subsection 3.4.3.6.7, Activities Occurring in the Mexican Portion of the Range. The Bureau of Ocean Energy Management, Regulation and Enforcement (BOEM; formerly the Minerals Management Service) leases mineral rights to submerged lands on the Outer Continental Shelf (OCS). These rights are conveyed by contracts referred to as leases. Each lease is generally a square measuring 3 miles by 3 miles (4.8 km by 4.8 km) and covers an area that is no more than 5,760 acres. Under a lease, a company has the right to apply for permits to explore and develop the mineral resources within that area. Before approving the permits, BOEM reviews all applications to ensure that the activities will be conducted in a safe

and environmentally-sound manner and that the interests of key stakeholders are effectively addressed. The BOEM regularly updates its leasing plans via a Five-Year Program that consists of a schedule of oil and gas lease sales indicating the size, timing, and location of proposed leasing activity the Secretary determines will best meet the country's national energy needs for the 5-year period following its approval. The upcoming leasing program covers the period of 2023 to 2028, and a Draft Programmatic EIS was published in July 2022 (87 FR 40859, July 8, 2022).

The proposed 2023-2028 lease sale schedule does not list any activity in the Pacific OCS Region but does list activity in the Cook Inlet Program Area of the Alaska OCS Region. Active leases are expected to result in continued development of offshore production facilities and pipeline, drilling activities, and seismic programs, as well as transportation and barging. While the disposition of leases purchased in recent sales is highly speculative at this time, it is probable that at least some seismic exploration and possibly some exploratory drilling could take place during the next few years.

Large areas in the ENP are not eligible for oil and gas development. In March 2010, President Obama withdrew the North Aleutian Basin from consideration for oil and gas development through 2017, noting that Alaska's Bristol Bay was an area "too special to drill" (U.S. Department of Interior 2010). Accordingly, the area around Bristol Bay, used regularly by gray whales during their migration and often used in the summer for feeding, will be protected for the foreseeable future. In addition, the president announced a strategy that excludes oil and gas exploration or development in areas near California, Oregon, and Washington. In February 2021, Representative Jared Huffman along with 47 cosponsors introduce the West Coast Ocean Protection Act of 2021 to the House Natural Resources Committee which sought to amend the Outer Continental Shelf Lands Act (43 U.S.C. § 1331 *et seq.*) to prohibit the Department of the Interior from issuing leases for the exploration, development, or production of oil and gas on the outer continental shelf off the coasts of California, Oregon and Washington (H.R. 653). Off the Pacific coast of Canada, a federal moratorium on offshore oil activities in the Pacific Ocean has precluded any oil and gas production activities, and we found no evidence of offshore oil and gas development off the Pacific coast of Mexico. Recent legislation regarding Mexican energy reform (Reuters 2014) could allow foreign and private companies to compete for offshore oil and gas fields; however, production fields are currently concentrated in the Gulf of Mexico (U.S. Energy Information Administration 2014).

NMFS has conducted extensive ESA section 7 consultations with BOEM regarding oil and gas leasing action on the Alaska OCS, none of which has resulted in a determination that OCS oil and

gas activities were likely to jeopardize the continued existence of any listed species, including baleen whales, or destroy or adversely modify critical habitat. Since the delisting of ENP gray whales in 1994, gray whales (including endangered WNP gray whales) have not been included in ESA section 7 consultations (and WNP gray whales have only recently been included as a result of scientists detecting animals moving between the WNP and ENP) (Subsection 3.4.3.2.1, WNP Seasonal Distribution, Migration, and Movements). It is likely, however, that the effects on gray whales would be similar to those on ESA-listed baleen whales. Accidental spills can be expected to have minor to moderate impacts that would depend on the location, timing, and volume of spills.

In the Mexican portion of the analysis area, mining for minerals (such as copper, manganese, gypsum, cobalt, silica, and phosphorus) peaked in the last century in places like Santa Rosalia, creating soil erosion, contamination, pollution, and litter in the ocean. Large mining companies have since abandoned these sites, and the town is in economic decline (ParksWatch 2004). The largest saltworks in the world is still operating at Guerrero Negro, where approximately 8 million tons (7.26 million metric tons) per year is extracted from the ocean through evaporation (ParksWatch 2004). The main threat posed by salt mining is the byproducts created by high salt concentrations (Geo-Mexico 2012). Plans to expand industrial salt extraction by establishing a plant on the shores of San Ignacio Lagoon met with strong international and national protest, and in March 2000, the government of Mexico cancelled the project. Conservation agreements negotiated between the Laguna San Ignacio Conservation Alliance and communal landowners have since placed 120,000 acres of land around the lagoon in a private land trust, and more agreements are anticipated (Sullivan 2006). Thus, it is reasonable to assume that the area will remain a sanctuary for wintering gray whales, while the local people fish and provide ecotourism and whale watching within the land trust (Sullivan 2006). Given that, as well as the continued use of Guerrero Negro and adjacent lagoons by gray whales and the lack of any evidence indicating that gray whales are affected by the existing saltworks, we do not expect this mining operation to have effects that would inform our cumulative impact analysis.

There had been growing interest in developing sites to explore wave and tidal energy technologies along the West Coast, especially along Oregon and Washington where wave energy potential is the highest in the lower 48 states (Bedard 2005). Potential effects to marine mammals include entanglements, collisions with equipment, and obstruction of migration routes. Past and present effects on gray whales are described in Subsection 3.4.3.6.10, Marine Energy Projects. Although a wave energy project that was proposed for Makah Bay (i.e., within the proposed hunt area) has been withdrawn, there are continuing efforts to develop marine energy projects elsewhere along the Pacific coast. As of January 2023, there is only one FERC-licensed

hydrokinetic project on the U.S. West Coast (FERC 2023). PacWave South Hydrokinetic (formerly known as Pacific Marine Energy Test Center South Energy Test Site Wave Test Center) is located on the Outer Continental Shelf of the Pacific Ocean, approximately 6 nautical miles off the coast of Newport, Oregon. In 2021, the Bureau of Ocean Energy Management (BOEM) issued a lease of the site to Oregon State University for marine hydrokinetic research activities at a proposed open ocean wave energy test center (86 FR 40620, July 28, 2021). FERC issued a license to Oregon State University for the construction, operation, and maintenance of the proposed test facility that would have a capacity of 20 megawatts. The PacWave South license is valid through February 2046. A second site, PacWave North, also operated by Oregon State University off the coast of Newport, Oregon, serves as a test site for small-scale, prototype technologies and is not grid-connected[5]. While there are several active preliminary permits under FERC for hydrokinetic projects in inland waters of Alaska (which allow developers to study the feasibility of proposed projects), there are no active or pending preliminary permits for projects on the coasts of Washington, Oregon, or California (FERC 2023) where gray whales could potentially travel.

Offshore wind energy projects have accelerated in recent years as a result of Executive Order 14008 issued on January 27, 2021. Among other things, the Executive Order prioritized climate-resilient development, including clean energy, with a goal of doubling offshore wind capacity by 2030. As the lead federal agency for offshore wind, BOEM has identified several possible Wind Energy Areas (WEAs) along the West Coast and is currently proposing to issue commercial leases for development in several sites on the coasts of Oregon and California. In 2022, BOEM announced the availability of a final EA and finding of no significant impact (FONSI) for the Morro Bay and Humboldt WEAs in northern and central California[6]. NMFS conducted an ESA Section 7(a)(2) consultation for issuance of leases at these sites (including assumptions about possible forthcoming site characterizations and site assessments), concurring with BOEM that activities associated with WEA development may affect, but not likely adversely affect, ESA-listed fish, turtles, and marine mammals (including WNP gray whales). Notably, this action does not include construction and operation of a wind energy facility, which would be a separate action assessed under NEPA and ESA. This assessment would likely provide insight into the anticipated level of increased vessel traffic associated with constructing and maintaining such a facility. In

[5] See https://pacwaveenergy.org/ for more information.

[6] For a summary and documents related to the NEPA processes for the Morro Bay and Humboldt, California sites, please see https://www.boem.gov/renewable-energy/state-activities/morro-bay-wind-energy-area for and https://www.boem.gov/renewable-energy/state-activities/humboldt-wind-energy-area.

December of 2022, BOEM held an online auction for five sites in the California WEAs, conducting the first-ever sale of its type on the Pacific Coast.

BOEM announced a call for information and nominations for possible sites off the Oregon coast (Coos Bay and Brookings) and is currently reviewing the nominations (87 FR 25529, April 29, 2022). NMFS provided public comment with recommendations to avoid and minimize impacts to marine resources and uses. With respect to gray whales, although the proposed sites are not in typical gray whale feeding areas (but they do overlap with typical migratory routes), NMFS recommended that lines and cables be buried to minimize interference with seafloor foraging.

In addition to the above activities, there has been growing interest in developing LNG terminals in coastal areas within the ENP. Several issues regarding impacts on whales have been identified with the construction and operation of LNG terminals (impacts resulting from LNG shipping traffic are addressed in Subsection 5.1.3.2, Shipping). Leaks, spills, explosions, and release of contaminants could impair water quality or cause physical harm to whales. Dredging and filling associated with terminal construction and maintenance could have impacts on benthic habitat and prey. Additionally, noise associated with terminal construction and operation could disturb whales near the terminal. Recent assessments identify an array of mitigation measures available to address such impacts, including limiting construction to times when species are absent from the area, re-contouring bottom sediments so that benthic communities can re-establish quickly, monitoring acoustic impacts for several years (to determine if terminal areas are being avoided by whales), and frequent reporting (NMFS 2008c). As noted in Subsection 5.1.3.2, Shipping, it is difficult to predict the number and location of LNG facilities that will actually be built within the analysis area, and we conclude that impacts from the development of LNG terminals are too speculative to inform a cumulative impact analysis.

In summary, we conclude that marine energy and coastal development projects are reasonably foreseeable future actions that could impact gray whales in localized areas of their range in the ENP. However, it is speculative to predict the likely extent or impacts from most of these types of projects. Oil and gas exploration and development as well as offshore wind development are the most likely activities, but impacts would depend on the location, timing, and magnitude of disturbances (e.g., construction noise or accidental oil spills).

5.1.3.7 Scientific Research

Explorers have studied the oceans since ancient times, and modern scientific studies of the ocean and marine life are common, ongoing, and expected to continue throughout the analysis area. Research on gray whales in particular has been a scientific pursuit since the 1800s and has helped make the species one of the most well-studied animals—and conservation success stories—in the

world (Jones and Swartz 1984). Researchers often use ships and boats to investigate a wide range of scientific issues, from large-scale programs monitoring marine productivity to site-specific studies cataloging marine mammal use of particular habitats. Studies are conducted by numerous federal, state, tribal, academic, and private researchers and can vary considerably in terms of location and duration in the analysis area depending on available funding and research priorities. Some studies target gray whales and other marine mammals and use sophisticated research vessels to explore large expanses of the analysis area on a regular basis. For example, the NMFS Southwest Fisheries Science Center (SWFSC) is responsible for monitoring and estimating abundance of all cetacean species (whales, dolphins, and porpoises) in the California Current Ecosystem off the U.S. west coast and has been conducting cetacean assessment cruises in this area since 1979 (NMFS 2014c). Surveys of California waters were conducted in 1979, 1980, 1991, and 1993, and surveys of the entire U.S. west coast were conducted in 1996, 2001, 2005, 2008, 2012, and 2018 (Moore 2021). These cruises often involve large NOAA research vessels (over 200 feet [61 m] long) that can stay at sea for several weeks. A Supplemental Programmatic Environmental Assessment for NMFS research in the California Current research area concluded that gray whales may be present when surveys occur, however it does not provide an estimate for how many gray whales may be subjected to harassment as a result of acoustic devices used during surveys (NMFS 2020b). The Biological Opinion associated with this action concluded that while there was potential for overlap between research activities and WNP gray whales, it is unlikely that WNP gray whales would be present and/or detect acoustic sources during the course of research (NMFS 2020c).

As recently as the late 1960s, some gray whale research involved the killing and sampling of over 300 hundred individual whales (Rice and Wolman 1971). However, gray whale research today generally relies on non-lethal forms of data collection (e.g., photographs and biopsies). Some methods of tagging and sampling can injure whales, but there has been significant progress in developing more effective tags and attachment methods that reduce adverse effects on whales while improving the quality of the resulting data (Weller 2008).

Growing interest in the Arctic Ocean system will likely see expanded research activities in northern portions of the gray whale range. For example, one of the most advanced research vessels ever built, the 261-foot (80-m) *R/V Sikuliaq*, was launched in 2012, was scheduled to begin research cruises in 2014, and will be homeported in Seward, Alaska (National Science Foundation 2012). In 2004, Russian and U.S. researchers initiated a Russian-American Long-term Census of the Arctic (RUSALCA) aboard the 235-foot (72-m) Russian research ship *Professor Khromov* (RUSALCA 2014). These cruises have been conducted annually and typically include surveys (including marine mammal observations) in areas used by gray whales

in the Bering Sea. While unlikely, due to the small number of research vessels that operate on the West Coast and their frequent use of observers to detect marine mammals nearby, it is conceivable that larger research vessels, such as those noted above, could strike and injure or kill a gray whale. For example, in 2009, a 50-foot NOAA research vessel struck a North Atlantic right whale off the coast of Massachusetts, leaving visible lacerations from the ship's propeller on the whale's fluke (Fraser 2009).

Research studies also employ small vessels that may intentionally or unintentionally encounter gray whales. Surveys focused on gray whale identification and biology typically involve small boats in close proximity to whales so that researchers can affix tags, take high-quality pictures for photo-identification, or obtain biopsy samples for genetic and toxicological studies. Pursuit by small research vessels would likely elicit responses comparable to whale-watching vessels. Also, as described in Subsection 3.4.3.6.6, Vessel Interactions, gray whales have been observed to respond to tagging by slapping their fluke and swimming rapidly but usually return to pre-tagging behavior shortly after the event. The response of gray whales to biopsy has not been described in the scientific literature, but studies of other mysticetes have reported a range of responses from little or no reaction to brief, sometimes dramatic, changes in behavior (Brown et al. 1991; Weinrich et al. 1991; Clapham and Mattila 1993; Gauthier and Sears 1999; Cantor et al. 2010).

We conclude that scientific research is a reasonably foreseeable future action that will continue to impact gray whales (most likely resulting from vessel strikes or disturbance) at the same rate as in the recent past (i.e., since the lethal research conducted in the 1960s by Rice and Wolman [1971]) throughout their range in the ENP, with the possibility that such impacts could increase in the Arctic as that region is explored for climate research, shipping, and oil and gas development.

5.1.3.8 Natural Mortality

As described in Subsection 3.4.3.1.6, Natural Mortality, sources of natural mortality for gray whales include predation, disease, and starvation. When we proposed to delist gray whales in 1991 (56 FR 58869, November 22, 1991) we reviewed factors affecting the species, including disease and predation. We noted that gray whales have a low natural mortality rate and that there is no information indicating that disease or predation constitutes a threat to the continued welfare of the species.

In 1999/2000, the mass stranding of ENP gray whales along the west coast led us to declare a UME. Population numbers declined perhaps as much as 25 percent between the 1997/1998 count and the 2001/2002 count (Table 3-3). NMFS works in coordination with external partners through the Marine Mammal Health and Stranding Network in California, Oregon, Washington, and Alaska to document and respond to stranded gray whales. This network was

established under the MMPA in the early 1980s. Members of the network include, among others, scientific institutions, volunteer groups, animal care institutions, veterinarians, wildlife agencies and state and federal law enforcement. Under the MMPA, the declaration of a UME authorizes a federal investigation led by a new Working Group on Marine Mammal Unusual Mortality Events into the cause of the event. NMFS has assembled an independent team of scientists to coordinate with the Working Group to collect samples from the stranded whales, review the data collected, and determine the next steps for the investigation.

We convened a Working Group (Gulland et al. 2005) to assess the 1999/2000 event because stranding rates had increased dramatically, animals were emaciated, and strandings occurred throughout the species' range, including areas where such events had not been historically noted. The Working Group concluded that the causes of this large-scale event were unknown and probably a result of both density dependence and environmental variability, noting that populations that are at or near carrying capacity may be more vulnerable to environmental variability because of nutritional stress (Gulland et al. 2005). Such nutritional stress was implicated in 2007 when researchers investigating one of the main calving-breeding lagoons in Mexico noted large numbers of whales that seemed malnourished and "skinny" in appearance (Subsection 3.4.3.1.7, Strandings). However, those conditions did not result in a UME. Moreover, we concluded in our stock assessment report that several factors since 2000 indicate the mass stranding was a short-term acute event and not a chronic situation or trend (Carretta et al. 2014).

Elevated strandings of ENP gray whales beginning in January 2019 prompted NMFS to declare another UME for the stock on May 29, 2019. As of September 26, 2023, the UME declared in 2019 is ongoing with 688 gray whales stranded along the coast of Mexico, the United States, and Canada, with the greatest number of strandings concentrated in the United States and Mexico (Table 3-4). The full extent of the mortality from this event is unknown. Although some carcasses have been recovered, it is likely that many carcasses either sank or washed out to sea rather than stranding, or became stranded in remote locations unobserved by humans. However, it is possible to estimate mortality resulting from this UME through ongoing population surveys conducted by NMFS, and noted above in Subsection 3.2.1.2. The current UME coincides with a recent 46% decline in abundance observed in the 2019/2020 survey (Stewart and Weller 2021a, Eguchi et al. 2023a).

So far, full or partial necropsies have been performed on just a few of the stranded animals. Samples can be difficult or impossible to collect if the whale has become too decomposed or has stranded in an inaccessible location. NMFS does not mandate what necropsy data to collect. However, stranding network partners often record as much basic data as possible (referred to as

Level A data), such as the state of decomposition and condition of the animal, the location of the stranding, and a list of samples that were collected, if any. Some, but not all, of the stranded whales have shown evidence of emaciation, but more research is needed to determine the cause(s) of the UME. It is not possible to predict how long the UME will continue. NMFS regularly posts updates regarding this UME on its website at https://www.fisheries.noaa.gov/national/marine-life-distress/2019-2020-gray-whale-unusual-mortality-event-along-west-coast-and.

Subsection 3.4.3.1.6, Natural Mortality, also notes that killer whales are the primary natural predators of gray whales, but it is difficult to quantify how many gray whales are killed or approached by killer whales each year. Nonetheless, NMFS scientists have noted evidence that predation by mammal-eating "transient" killer whales may be a significant mortality factor (especially on gray whale calves) and could increase if those killer whale populations continue to increase in the ENP (Murphy 2014; NMFS 2014d). It is unclear how natural mortality may be influencing the WNP stock of gray whales, although Bradford et al. (2009) noted a high incidence of killer whale tooth scars. The WNP stock has been increasing in abundance in recent years (Cooke et al. 2013); however, its small size, limited number of reproductive females, and relatively low calf survival are likely to be key factors limiting potential population growth (Burdin et al. 2012).

We conclude that natural mortality is a reasonably foreseeable future event that will continue to impact North Pacific gray whales and that the ENP gray whale stock will continue to fluctuate as it adjusts to natural and human-caused factors affecting the carrying capacity of the environment (Carretta et al. 2023). While the WNP stock has increased over the past 10 years, it remains small and likely more susceptible to changes in mortality (natural or human-caused).

5.1.3.9 Climate Change and Ocean Acidification

Climate change is underway and the scientific evidence indicates that average temperatures in the air, land, and sea are increasing at an accelerating rate. Long-term negative environmental impacts associated with climate change include rising sea levels as a result of melting glaciers and sea ice and seawater expansion, altered weather patterns and extremes, and ecosystem changes affecting species distributions and dynamics. A report on ecological impacts of climate change by the National Academy of Sciences (2008) states that most of the observed global and regional warming over the past 50 years is the result of increased greenhouse gases generated by human activities (e.g., burning of fossil fuels by vehicles such as ships and boats). The report goes on to note that there is only a very limited understanding of how global climate change might affect whole ocean ecosystems.

Although climate changes have been documented over large areas of the world, the changes are not uniform and affect different areas in different ways and at different intensities. For example, while gently sloping beaches in the action area could be most vulnerable to sea-level rise (e.g., Pendleton et al.'s [2004] assessment for Olympic National Park), Mote et al. (2008) estimate that the northwest Olympic Peninsula will experience very little relative sea-level rise because of rates of local tectonic uplift that currently exceed projected rates of sea level rise. In contrast, Arctic regions have experienced some of the largest changes (e.g., reduced ice cover and loss of multi-year ice), with major implications for the marine environment as well as for coastal communities (Arctic Climate Impact Assessment 2004; Larsen et al. 2014; Huntington et al. 2020). Global climate change is also likely to increase human activity in the Arctic, including oil and gas exploration and shipping, as sea ice decreases (Hovelsrud et al. 2008).

In addition to affecting air and water temperatures, carbon dioxide (CO_2) created by human activities is absorbed into the oceans, resulting in an increase in acidity of surface ocean waters (up to a depth of 328 feet [100m]). Scientists predict that by 2100 the acidity (pH) of surface ocean waters will be at a level not experienced for at least the past 420,000 years and that the rate of change will be 100 times the maximum rate detected during that period (Royal Society 2005). As noted in Subsection 3.4.3.6.11, Climate Change and Ocean Acidification, ocean acidification will likely affect calcifying organisms (many of which are important in the gray whales' diet) and may alter entire ecosystems if organisms are unable to adapt to the projected changes. There is considerable uncertainty about the degree to which these organisms will be affected by increased ocean acidity. Higher trophic species are also affected by climate change; a recent review identified several impacts of climate change on marine mammals in U.S. waters, including those related to fitness, ecological, and health impacts (Gulland et al. 2022). Although Gulland et al. (2022) did not identify studies that observed climate effects on gray whales, they did note two other Arctic cetacean species (bowhead and killer whales) that appear thus far to have benefited from increased access to prey or seasonal range expansions due to climate change. Other marine mammal species experienced increased mortality directly and indirectly associated with climate change. The authors conclude that more research is required to fully understand the effects of climate change on the demography and health of marine mammals more broadly (Gulland et al. 2022).

Bluhm and Gradinger (2008) examined the availability of pelagic and benthic prey in the Arctic and concluded that pelagic prey is likely to increase while benthic prey is likely to decrease in response to climate change. They noted that marine mammal species that exhibit trophic plasticity (such as gray whales that feed on both benthic and pelagic prey) will adapt better than trophic specialists. Moore (2008) characterized gray whales as useful "sentinels" of climate change,

citing various lines of evidence that the health and habits of gray whales seem to be tracking changes in the North Pacific and western Arctic ecosystems. Recent research has affirmed this characterization and documented climate-related impacts to gray whale distribution, abundance, phenology, mortality, and calf production in the Pacific Arctic feeding grounds (see Subsection 3.4.3.6.11, Climate Change and Ocean Acidification) (Gailey et al. 2020; Perryman et al. 2021; Moore et al. 2022; Joyce et al. 2023; Stewart et al. 2023).

We conclude that climate change is a reasonably foreseeable future event, with predictable impacts on the physical environment. For example, sea ice is likely to recede, sea levels are likely to rise, and acidity levels are likely to increase. Some biological impacts are also predictable, such as a decreased ability for some organisms to form shells. However, it is currently speculative to predict how those changes will affect marine food webs and gray whale population dynamics.

5.1.3.10 U.S. Government Policy

Subsection 3.8, Social Environment, and Subsection 3.10, Ceremonial and Subsistence Resources, describe some aspects of the U.S. government's legacy of diminishing and discouraging Makah subsistence and ceremonial practices. The Tribe's waiver application (Makah Tribe 2005) and its recent needs statement submitted to the IWC (Renker 2018) also detail the impacts of federal policies that have had major and lasting influences on Makah culture. Examples of such policies included banning potlatches and traditional secret societies, replacing a hereditary leadership system with an egalitarian election-based system, forcing children to attend boarding schools and abandon the Makah language, and promoting agricultural practices ill-suited to the landscape over traditional reliance on harvesting marine resources. As evidence of the latter, Renker (2018) noted:

> While the Treaty of Neah Bay preserved the Makah right to hunt whales and seals, and to fish in usual and accustomed grounds, the United States aggressively pursued policies that were intended to transform Makahs and other Indian communities into "civilized" people. Assistance sent to the Makahs contained agricultural tools, rather than items which supported any of the active components of the Makahs' maritime way of life. Instead of tools and materials which would help to procure, process, or preserve whale, seal, or fish products, Makahs received pitchforks, scythes, hoes, and sickles.

Although some of these policies have changed in the past century (e.g., the school system no longer separates Makah children from their families), their legacy affects the same cultural values that are likely to be affected by a denial of the Tribe's request under Alternative 1: tribal identity,

individual and community pride and self-esteem associated with pursuing cultural activities, a sense of autonomy and control of the Tribe's destiny, and confidence in the federal government (Subsection 4.10.3.1, Alternative 1, No Action). In the future, it is likely that the U.S. government would continue to honor the 1855 Treaty of Neah Bay (refer to Subsection 1.2.2.4, The Federal Trust Responsibility). Other future government policies are difficult to predict as are future trends in the values of the dominant culture that may affect Makah ceremonial and subsistence practices.

5.2 Water Quality

As described in Subsection 3.2.3, Water Quality, Existing Conditions, the Washington State Department of Ecology has not listed any of the waters in the action area as impaired (in other words, no past or current actions are negatively affecting the quality of waters in the action area to the point that they are impaired). Oil and gas exploration is expected to continue to be focused in Arctic regions outside the action area. Some accidental spills from a variety of ocean-going vessels (including commercial, charter, and research vessels) could increase in the future as shipping increases and can be expected to have localized adverse effects on water quality. Effects on water quality associated with potential LNG, offshore wind, and wave energy facilities cannot be predicted given the uncertainties about whether and where any facilities will actually be built.[7] The Navy's Supplemental EIS for the Northwest Training Range Complex (U.S. Navy 2020) found that chemical, physical, or biological changes in sediment or water quality would not be detectable and would be below or within existing conditions or designated uses. The basis for this conclusion includes the following reasons:

- Expended materials and activities are widely dispersed in space and time. When multiple stressors occur at the same time, it is usually for a brief period. Potential areas of negative impacts would be limited to small zones adjacent to the explosive, metals, or chemicals other than explosives. The failure rate is low for explosives and materials with propellant systems, limiting the potential impacts from the chemicals other than explosives involved.
- Many components of expended materials are relatively nonreactive, corrode slowly, and most components are subject to a variety of physical, chemical, and biological processes that render them benign.

[7] The Environmental Assessment for the Makah Bay wave energy project (now abandoned) concluded that it would have had only localized and short-term impacts on water resources (FERC 2007).

- Several studies at sites used frequently for training and testing activities in the Puget Sound found traces of metals, but all concentrations were well below background levels for both sediment and water quality.

Therefore, activities in the U.S. Navy Training Complexes are not expected to adversely affect water quality.

Along the Oregon and Washington coasts, the occurrence of a "dead zone"—an area of seawater with insufficient oxygen to support most marine life—has been linked to climate change (National Academy of Sciences 2008; NOAA Research 2021). Suggested causes include climate-related changes in coastal winds and ocean circulation as well as the possibility that warmer ocean waters have directly affected the water column's ability to hold oxygen. Marine heatwaves (MHWs) also contribute to the occurrence of dead zones and other short-term changes in water quality, such as increased stratification and the deepening of the nutricline (Cavole et al. 2016). MHWs have been increasing in frequency globally since 1985, a trend that is expected to continue as a result of climate change (Oliver et al. 2018). In a recent report by the U.S. Global Change Research Program (May et al. 2018), climate variability in the Northwest is expected to contribute to continued coastal erosion, ocean acidification, harmful algal blooms, warmer ocean waters, altered marine chemistry, sea level rise, and shifts in the marine ecosystem that are expected to impact coastal communities, including Tribal nations. A number of federal, state, and local actions are being planned or implemented to mitigate effects of climate change (e.g., energy efficiency measures, clean technologies, and alternative fuels), but there is not always broad acceptance of such actions (Melillo et al. 2014).

Increased vessel traffic because of a gray whale hunt could increase the risk of oil spills and generation of greenhouse gases in the analysis area above existing levels associated with vessels involved in shipping, fisheries, tourism, or scientific research. It is likely, however, that the amount of oil from a potential spill or greenhouse gas emissions associated with a hunt would be small (because of the size and number of vessels involved) and would quickly disperse (Subsection 4.2.3, [Water Quality] Evaluation of Alternatives).

For the reasons described above, we conclude that when the effects of past, present, and reasonably foreseeable future actions are added to the direct and indirect effects of Alternatives 1 through 7, the incremental effects of Alternatives 1 through 7 are not likely to be different from the effects described in Section 4, Environmental Consequences. We, therefore, do not expect there would be significant cumulative effects on water quality.

5.3 Marine Habitat and Species

As described in Subsection 3.3.3, Marine Habitat and Species (Existing Conditions), the marine habitat and species in the action area are situated in the larger California Current system and are shaped by large-scale physical processes that would not be affected by any hunting or associated activities under any of the alternatives. In addition, hunting activities under any of the alternatives would have only minor, short-term, and localized impacts on the marine habitat or species in the project area. Oil and gas exploration is expected to continue to be focused in Arctic regions where disturbance from development and accidental spills can be expected. However, impacts to gray whales would depend on the location and timing of exploration and development activities, and the location, timing, and volume of spills. Effects on habitat and species associated with potential LNG and marine energy facilities (see Subsection 5.1.3.6, Marine Energy and Coastal Development) cannot be predicted given the uncertainties about whether and where any facilities will actually be built. Although the Makah Bay wave energy project has been halted, the FERC assessment (FERC 2007) associated with it provides useful insights into the types of mitigation that could be pursued for similar types of projects. It included a variety of protective measures to reduce any potential impacts to marine habitats and species, including developing a fuel and oil spill control, prevention, and countermeasures plan; developing and implementing a plan to conduct a baseline and post-installation hard substrate benthic community survey along the proposed submarine transmission line route; and removing existing marine debris and derelict fishing gear from the immediate project area prior to project construction and installation. Offshore wind energy development is expected to take place in the coming years off the coast of Oregon and/or California. Potential impacts to the marine habitat and species, including gray whales, are being discussed and assessed through NEPA and ESA consultations, as the currently proposed sites may overlap with migration routes (see Subsection 3.4.3.6.10, Marine Energy projects.

Subsection 5.1.3.3, Military Exercises, and Subsection 5.2, Water Quality, summarize the impacts of military exercises in the analysis area, and that information is equally relevant to our assessment of marine habitat and species. Activities in the U.S. Navy training complexes that may affect marine communities include explosions and materials expended during training and testing activities. Marine habitat subjected to underwater detonations would primarily be soft-bottom sediment. These disturbance events would be spread out over time, allowing recovery of the area by natural processes. The Navy's Supplemental EIS for the Northwest Training Range Complex (U.S. Navy 2020) found that any impacts from training and testing exercises are negligible and not expected to result in detectable changes to marine vegetation growth, survival, or propagation and are not expected to result in population-level impacts. Potential impacts on marine invertebrates are largely qualitative and speculative and are not expected to decrease the

overall fitness or result in long-term population level impacts on any given population. Likewise, the Navy determined that proposed military exercises would not diminish the ability of soft shores, soft bottoms, hard shores, hard bottoms, or artificial substrates to function as habitat.

Subsection 3.4.3.6.11, Climate Change and Ocean Acidification, Subsection 5.1.3.9, Climate Change, and Subsection 5.2, Water Quality, summarize the impacts of climate change, and that information is equally relevant to our assessment of marine habitat and species. The climate change report by the National Academy of Sciences (2008) notes that, along the Pacific coast, there has already been an observed shift in the types of species that are found in certain locations. For example, formerly "southern" species have become more abundant along the Pacific coast, while many "northern" species have declined. The U.S. Global Change Research Program (Mote et al. 2014) also notes that rising sea levels are expected to negatively impact species such as shorebirds and forage fish that rely on coastal wetlands, tidal flats, and beaches, especially in areas where habitats cannot shift inland because of topography or physical barriers created by human development. It also projects that anadromous species such as salmon will face adverse freshwater conditions (e.g., warmer streams with reduced flows) once they leave the ocean. That report goes on to underscore that "as species respond to climate change in diverse ways, there is potential for ecological mismatches to occur—such as in the timing of the emergence of predators and their prey." In the analysis area, one group of species that seems likely to be adversely affected—shell-forming invertebrates—is an important prey base for gray whales. Many of the observed and projected climate change impacts can take many decades to detect. In the analysis area, it is reasonable to conclude that changes will occur, but it remains unclear and largely speculative how marine species and habitats will respond and adapt to such changes. As noted in Subsection 5.1.3.9, Climate Change and Ocean Acidification, sea level rise could impact gently sloping beaches in the action area, but the northwest Olympic Peninsula overall is expected to experience very little sea-level rise.

Increased vessel traffic as a result of a gray whale hunt could increase the risk of oil spills and the generation of greenhouse gases in the analysis area above existing levels associated with vessels involved in shipping, fisheries, tourism, and scientific research. It is likely, however, that the amount of oil from a potential spill or greenhouse gas emissions associated with a hunt would be small (because of the size and small number of vessels involved), quickly disperse, and have only short-term and localized effects on marine species and habitats in a the analysis area.

For the reasons described above, we conclude that when the effects of past, present, and reasonably foreseeable future actions are added to the direct and indirect effects of Alternatives 1 through 7, the incremental effects of Alternatives 1 through 7 are not likely to be different from

the effects described in Section 4, Environmental Consequences. We, therefore, do not expect there would be significant cumulative effects on marine habitat and species.

5.4 Gray Whales

Subsection 3.4, Gray Whales (Affected Environment), provides a comprehensive review of the North Pacific gray whale stocks (both WNP and ENP) and the PCFG feeding aggregation inhabiting the action area. Subsection 4.4, Gray Whales (Environmental Consequences), considers the potential impacts of the seven alternatives on the welfare of individual gray whales as well as impacts at the stock level and to the PCFG (including whales in local survey areas within the PCFG range). The PCFG is presently not considered a population stock under the MMPA, but we have included the PCFG in recent stock assessment reports because it appears to be a distinct feeding aggregation and may warrant consideration as a separate stock in the future (Carretta et al. 2023).

For the ENP gray whale stock as a whole, past over-harvesting led to its listing in the United States as an endangered species. With the moratorium on commercial harvest, the stock recovered to the point where it was de-listed. All seven alternatives are likely to have the same effect on the ENP gray whale stock as a whole, which is the removal of an average of 140 whales per year (zero to five whales on average struck by Makah hunters with the remainder struck in the Chukotkan hunt). Although some of the alternatives are of limited duration (e.g., under Alternative 7, the waiver would expire after 10 years), for purposes of this cumulative effects analysis, we consider that effects to ENP gray whales would continue at the same rate into the future, assuming the United States continues to transfer any unused portion of the catch limit to the Chukotkans. This level of mortality would be added to other sources of human-caused mortality that include whales that are killed by ship strike, whales that are killed incidental to fishing operations, and whales that are struck and lost during a hunt and that may die as a result of their injuries.

The WNP stock remains listed as an endangered species under the ESA and is a depleted stock under the MMPA. Recent information from tagging, photo-identification, and genetic studies shows that some whales identified in the WNP off Russia have been observed in the ENP, including the project area. Given this interchange and the occurrence of whales in U.S. waters, a 2012 NMFS task force agreed that a stand-alone WNP gray whale population stock assessment report was warranted (Weller et al. 2013), and they have been included in NMFS' annual stock assessments since. Studies to date have recorded a total of 60 gray whales observed in both the WNP and ENP (the earliest record in 1995) (Lang 2010; Mate et al. 2011; Weller et al. 2012; Urbán et al. 2013; Mate et al. 2015; Urbán-Ramirez et al. 2019; Martinez-Aguilar et al. 2022a),

which is a small fraction of the roughly 14,000 whales in the ENP stock. As described in Subsection 3.4.3.2.4, WNP Status, Carrying Capacity, and Related Estimates, and Subsection 4.4.3.2.2, Change in Abundance and Viability of the WNP Gray Whale Stock, modeling based on Moore et al. (2023) indicates that under the Tribe's proposed action hunters might strike a WNP whale approximately once every 61 to 90 years, equating to a 7 to 10 percent chance of hunters actually striking at least one WNP whale in 6 years. However, the analysis by Moore et al. (2023) relies on several assumptions regarding the proposed hunt that are not likely to occur (NMFS 2023a). Given the small size of the WNP stock and the very limited data on the occurrence of whales observed in the WNP in the analysis area, it is speculative to predict whether appreciable effects would be expected from any of the activities assessed in Subsection 5.1.3, Past, Present, and Reasonably Foreseeable Future Actions.

Increased vessel traffic as a result of a gray whale hunt could increase the risk of oil spills and generation of greenhouse gases in the analysis area above existing levels associated with vessels involved in shipping, fisheries, marine energy and mining, tourism, and scientific research. It is likely, however, that the amount of oil from a potential spill or greenhouse gas emissions associated with a hunt would be small (because of the small size and number of vessels involved), would quickly disperse, and have only short-term and localized effects on marine species and habitats in the analysis area. The most recent stock assessment report (Carretta et al. 2023) evaluates the status of the ENP stock and the PCFG and summarizes recent data on human-caused mortality and serious injury because of fisheries, ship strikes, and aboriginal harvest in Russia. Based on 2014 to 2018 data, the estimated annual level of human-caused mortality and serious injury for ENP gray whales includes Russian harvest (119), mortality from commercial fisheries (9.3), and ship strikes (1.8), totaling 130 whales per year. Estimates for human-caused mortality for whales observed in the PCFG range and season include annual average mortality from commercial fisheries (1.1) and ship strikes (0.6), totaling 1.7 whales per year. These values are well below the calculated annual levels of potential biological removal of ~409 ENP whales (or less) and 3.1 PCFG whales (see Table 3-11).

Data on gray whale mortality in Canadian waters is more limited. A past assessment by Scordino et al. (2014b) identified six gray whales killed or injured by ship strikes or in fisheries interactions in Canadian waters during 2008 to 2012. Even if all of these whales were classified as killed PCFG whales (an annual average mortality of 1.2 PCFG whales) and added to the values reported by Carretta et al. (2023), the annual average human-caused mortality would be 2.9 whales observed in the PCFG range and season, which is still lower than the 3.1 PCFG whales reported as the potential biological removal level in our stock assessment report. Overall, fisheries-related mortalities in Canada are thought to be small and the large stock size of the ENP

population and rate of increase in the past makes it unlikely that unreported mortalities from those fisheries would be a significant source of mortality for this stock (Angliss and Outlaw 2008). Finally, the IWC's modeling of the Tribe's proposed hunt (IWC 2013c) (refer to Subsection 3.4.3.4.4, PCFG Status, Carrying Capacity, and Related Estimates – IWC Implementation Review of PCFG Gray Whales) included an even more precautionary estimate of non-hunting human-caused mortality[8] (2.0 PCFG whales), which is higher than the 1.7 whales in the PCFG range and season reported in the most recent stock assessment report (Carretta et al. 2023). The 2020 Implementation Review incorporated updated PCFG abundance estimates, which did not alter their previous advice.

Data regarding gray whale mortalities in Mexico and Russia as a result of interactions with shipping and fisheries are not readily available. However, the number of strandings from Alaska to California[9], as well as Mexico, has been higher in recent years (2019 to present) since the onset of the current UME (Subsection 3.4.3.1.7, Strandings). The number of whales struck and lost in the Chukotka hunt has varied annually, with nine reported in 2005 as the highest recent reported number. Assuming all struck and lost whales die, the average number of whales potentially lost from all sources of human-caused mortality would be approximately 139 animals per year. That number is slightly more than one-quarter of the calculated PBR for the ENP gray whale stock. The effects of human-caused mortality would not affect the ability of the ENP gray whale stock as a whole to maintain at, or reach, its OSP level.

As described in Subsection 5.1.3.5, Tourism, although whale watching has grown in recent years within the overall analysis area, some regions within this area have remained relatively stable (or even declined) so it is not possible to predict how much this industry might grow in the future and what, if any, appreciable effects might accrue beyond those assessed in Subsection 4.4, Gray Whales.

Oil and gas exploration is expected to continue to be focused in Arctic regions where disturbance from development and accidental spills can be expected. However, impacts to gray whales would depend on the location and timing of exploration and development activities, and the location, timing, and volume of spills. Appreciable effects on gray whales from potential LNG and marine energy facilities (including potential wind energy sites) cannot be predicted given the uncertainties about whether and where any facilities will actually be built. If these facilities are developed in the analysis area they could affect migrating or feeding gray whales. Such projects could have a greater impact on summer-feeding PCFG whales than on the ENP gray whale stock

[8] The IWC model assumed this value would vary directly with changes in abundance.
[9] We were unable to obtain Mexico stranding data for 2003, 2006 to 2014, and 2016.

as a whole because the summer-feeding whales spend more time in waters near potential LNG and other marine energy facilities. If marine energy or LNG projects negatively affect the abundance of gray whales identified in the PCFG or the OR-SVI survey area, the number of identified whales that could be harvested would be reduced accordingly (i.e., via the formulas used to place additional limits on the harvest or mortality of PCFG whales).

As discussed above in Subsection 5.1.3.3, Military Exercises, impacts to gray whales in the Navy's complexes would mostly stem from the use of sonar and other active acoustic sources during training and testing activities. However, these are not expected to injure gray whales and long-term consequences would not be expected on individual gray whales or the WNP and ENP stocks overall. In addition, the Navy does not anticipate vessel strikes on gray whales but has taken the precautionary step of requesting authorization from NMFS to incidentally take a total of one to four large whales annually by injury or mortality in the NWTR and SOCAL complexes. Further north, training activities in the GOA Complex normally occur during April and October, and most gray whales would have moved through the area by mid-June to feed north of the Aleutian Islands (Subsection 3.4.3.3.2, ENP Seasonal Distribution, Migration, and Movements) (U.S. Navy 2011). The Navy's most recent Supplemental EIS for this complex (U.S. Navy 2022) projects a large reduction in the number of predicted acoustic stressor impacts compared to the previous EIS (U.S. Navy 2011) and, therefore, it is even less likely that there would be any long-term impacts on individuals or populations of marine mammals.

As described in Subsection 5.1.3.7, Scientific Research, we expect that impacts from research vessels and activities will likely continue to affect gray whales (most likely from vessel strikes or disturbance) at the same rate as in the past throughout their range. It is possible that such impacts could increase in the Arctic as that region is explored for climate research, shipping, and oil and gas development. However, there is no evidence to indicate that disturbance or mortalities of whales from scientific research would result in any appreciable effects beyond those assessed in Subsection 4.4, Gray Whales. Additionally, any increase in shipping and development is speculative.

Increased killer whale predation could be a concern for ENP gray whales, but it is unlikely that an increase in predation would result in appreciable effects when combined with mortality from a tribal hunt because none of the alternatives are likely to result in increased mortality of ENP gray whales overall. Increased killer whale predation could also be a concern for PCFG whales, although it is not possible to predict how much such predation could increase. If killer whale predation did result in a decrease in PCFG abundance, allowable harvest levels would go down under action alternatives 2 through 6, because the limits on harvest levels under those alternatives

are based on the population abundance. This would also be the case if a UME causes a decline in the PCFG population. Under Alternative 7, a hunt would be prohibited if the PCFG low abundance threshold was met. Because such adjustments account for a change in abundance, we would not expect the impacts of a hunt under any of the alternatives to have cumulative effects with killer whale predation when taken into consideration with past, present, and reasonably foreseeable future actions. As noted in Subsection 5.1.3.8, Natural Mortality, it is unclear how natural mortality may be influencing the WNP stock of gray whales, though as a small population the stock may be more susceptible to changes in mortality.

Global climate change may also affect abundance, viability, and distribution of gray whales in the future. Gray whales feed on a variety of prey, both benthic and pelagic, and the whales will switch feeding areas and strategies in response to changes in prey availability (Subsection 3.4.3.3.2, ENP Seasonal Distribution, Migration, and Movements). Changes in Arctic conditions may cause many seasonal migrant species to range farther north in search of prey, and it seems that gray whales may already be doing so (Moore et al. 2007, Moore and Huntington 2008). Moore and Huntington (2008) observed that "gray whales are perhaps the most adaptable and versatile of the mysticete species," are opportunistic foragers, and have documented feeding year-round off Kodiak, Alaska. In a rangewide workshop on gray whales (IWC 2014e), it was noted that the loss of Arctic sea ice now allows gray and other baleen whales a month or more longer to feed in the Arctic, and changes in the primary production there may result in more prey for these whales. Bluhm and Gradinger (2008) examined likely trends in the availability of pelagic and benthic prey in the Arctic and concluded that pelagic prey is likely to increase while benthic prey is likely to decrease. They noted that marine mammal species that feed both pelagically and benthically (such as gray whales) will fare better than those that only feed benthically. For gray whales, they observed that the composition of gray whale prey may be less important than the energy density at feeding sites. In their review of reported climate change impacts on gray whales, Salvadeo et al. (2013) cited the following as likely gray whale responses to global warming:

- Fewer whales in the Gulf of California
- Increased numbers of mothers with calves along the California coast
- Winter occurrence of whales in their feeding areas
- Recolonization of the Atlantic Ocean by gray whales
- Decrease in whale numbers in the breeding lagoons

Several of these predictions have been realized in recent years coinciding with the current UME, including fewer whales in the Gulf of California, reduced number of whales in the breeding

lagoons (LSIESP 2023), and shifting occurrence in feeding areas (Moore et al. 2022; Joyce et al. 2023).

As described in Subsection 3.4.3.6.11, Climate Change and Ocean Acidification, recent work has characterized gray whale distribution, abundance, and phenology in the Pacific Arctic northern feeding grounds as a function of sea ice cover (Gailey et al. 2020; Perryman et al. 2021; Moore et al. 2022; Joyce et al. 2023) and prey distribution (Moore et al. 2022). As described in Subsection 3.4.3.3.4, ENP Status, Carrying Capacity, and Related Estimates, gray whale population dynamics and major mortality events have been linked to both sea ice cover and prey biomass (Stewart et al. 2023). Calf production has also been tied to climate variables and sea ice cover (Gailey et al. 2020; Perryman et al. 2021). While it is still unclear the exact impacts, and mechanisms of impact, that climate change has on gray whales, it is likely that impacts are occurring and will continue into the future.

Ocean acidification is another future development that could affect gray whales by affecting their prey. Increased acidity in the ocean will reduce the abundance of shell-forming organisms (Fabry et al. 2008; Hall-Spencer et al. 2008), some of which are important in the gray whales' diet (Moore and Huntington 2008). Although there is considerable uncertainty about the degree to which these organisms will be affected by increased ocean acidity, modeling analyses by NMFS' scientists indicate that the flexible foraging strategies of gray whales may mitigate the effects of ocean acidification on the species. The Atlantis model predicts no change in the biomass of the baleen whale group, 62 percent of which is made up of gray whales, even under the most extreme scenario for future acidification (Dufault et al. 2009; Kaplan et al. 2010). We conclude that any climate-induced impacts on gray whales will likely manifest over the long term, but these impacts are too speculative to predict at this time.

For gray whales in the PCFG range and local survey areas within this range (e.g., the OR-SVI and Makah U&A), there are no other appreciable effects that are unique from those that affect the ENP stock as a whole. Because PCFG whales are a small subset of the larger ENP stock (numerically and geographically), it is possible that future activities might have disproportionately greater effects on PCFG whales and whales using local survey areas. However, such impacts are not foreseen at this time and would depend on the location, timing, and magnitude of activities/disturbances. Therefore, adding the potential disturbance and mortalities associated with a gray whale hunt under Alternatives 2 through 7 to existing levels of disturbance and mortality of past, present, and reasonably foreseeable future actions would not be expected to have cumulative effects on gray whales in the PCFG, local survey areas within the PCFG range, and individual gray whales. For individual whales, it is possible that the stress associated with

hunting, when added to existing sources of stress such as those described in Subsection 3.4.3.6, Known and Potential Anthropogenic Impacts, could lead to the mortality of some individual whales. This possibility is explored in Subsection 4.4.2.1, Change in Abundance and Viability of the ENP Gray Whale Stock.

While the current UME has resulted in a 46% decline in the ENP population abundance in the last 7 years (Eguchi et al. 2023a), it is unclear how or if the PCFG population has been affected by the UME, given that the PCFG abundance numbers have remained relatively stable. If the current or a future UME equally affected PCFG whales, it could magnify the effects on the PCFG of mortality associated with a tribal hunt because the hunt-related death of up to four animals per year would have a bigger impact on a smaller population. However, measures included in the action alternatives, e.g., low abundance thresholds, would mitigate this impact.

As described above, the ENP population has experienced large fluctuations in its population and has recovered from previous declines in abundance. It is difficult to predict the timing and likelihood of another significant decline in ENP abundance; however, it would be possible to mitigate for such an event by including measures in hunting regulations that would constrain hunting in that scenario. The Scientific Committee of the IWC annually monitors the status of ENP gray whales. In the event that gray whale abundance declines as a result of human activities or other unforeseen causes, the IWC has a process in place to adjust catch limits for aboriginal subsistence hunting (Subsection 1.2.4.1.3, IWC Aboriginal Subsistence Whaling). Such adjustments to catch limits could in turn affect the issuance of hunt permits under the proposed hunt regulations. Further, the three Sub-alternatives to the Preferred Alternative could implement an abundance threshold for the ENP stock below which hunting would cease. Such a threshold, if implemented, could serve as an additional precaution to protect the ENP stock.

5.5 Other Wildlife

Subsection 4.5.3, [Other Wildlife] Evaluation of Alternatives, analyzes the effects likely to occur to other wildlife species from implementation of Alternatives 2 through 7. These effects would primarily be from vessel noise and disturbance and would be greater under alternatives that involve the greatest number of days of hunt-related trips (Alternatives 2, 3, and 6), although hunting that takes place farther offshore (as under Alternative 3) would have a lower likelihood of affecting species that are present on the rocks and islands closer to shore. Some disturbance could also be expected from aircraft and weapons discharge associated with a hunt. Under all action alternatives, these effects are expected to be minor and temporary for all species with the possible exception of some seabird colonies during the nesting season.

Subsection 3.13.3, [Transportation] Existing Conditions, describes existing levels of vessel and air traffic in the project area to which the additional vessel and air traffic would be added under Alternatives 2 through 7. Future increases in shipping have the potential to affect marine mammals and birds through vessel interactions and noise. Vessel collisions with marine mammals, though rare, could increase as a result of increased shipping.

Oil and gas exploration is expected to continue to be focused in Arctic regions where disturbance from development and accidental spills can be expected. Effects on other wildlife associated with potential LNG and wave energy facilities cannot be predicted given the uncertainties about whether and where any facilities will actually be built. Although the Makah Bay wave energy project has been halted (see Subsection 3.4.3.6.10, Marine Energy Projects, for more detail), the FERC assessment (FERC 2007) associated with it provides useful insights into the types of mitigation that could be pursued for similar types of projects. It included a variety of protective measures to reduce any potential impacts to marine habitats and species, including developing a fuel and oil spill control, prevention, and countermeasures plan; developing and implementing a plan to conduct a baseline and post-installation hard substrate benthic community survey along the proposed submarine transmission line route; and removing existing marine debris and derelict fishing gear from the immediate project area prior to project construction and installation.

Activities in the U.S. Navy Training Complexes that may affect wildlife include collisions, explosions, and materials expended during training and testing activities. The EIS found that potential impacts on certain fish, bird, turtle, and marine mammal species could include injury or mortality, but impacts are not expected to decrease the overall fitness of or result in long-term population level impacts on any given population. In cases where potential impacts rise to the level that warrants mitigation, the Navy has identified numerous measures, including enhanced training, lookouts/surveillance, buffers, and approach protocols.

Global climate change will likely affect the distribution, abundance, and viability of various wildlife species. A report on ecological impacts of climate change by the National Academy of Sciences (2008) states that “climate change is happening on a global scale, but the ecological impacts are often local and vary from place to place.” That report goes on to describe how shifts have already been observed in species’ ranges and phenology (the timing of biological activities that occur seasonally). Along the Pacific Coast, one observed shift is that formerly “southern” species have increased in abundance since the mid-20th century, while many “northern” species have decreased as temperatures warm.

Ocean acidification is likely to adversely affect shell-forming organisms, which could in turn have widespread impacts on marine ecosystems (Fabry et al. 2008); however, there is

considerable uncertainty about the degree to which particular species will be affected. Modeling analyses by NMFS' scientists indicate highly variable results within food webs and that flexible foraging strategies may mitigate the effects of ocean acidification on certain species. For example, the Atlantis model predicts that groundfish stocks such as English sole, arrowtooth flounder (i.e., large flatfish), and yellowtail rockfish (midwater rockfish) may be particularly susceptible to the loss of shelled prey items from their diet (Kaplan et al. 2010). In contrast, some species of nearshore fish were predicted to increase (relative to a no acidification scenario) because of declines in their predators. We conclude that any changes in species assemblages and food webs will likely manifest over the long term, but these are too speculative to predict.

For the reasons described above, we conclude that when the effects of past, present, and reasonably foreseeable future actions are added to the direct and indirect effects of Alternatives 1 through 7, the incremental effects of Alternatives 1 through 7 are not likely to be different from the effects described in Section 4, Environmental Consequences. We therefore do not expect there would be significant cumulative effects on other wildlife.

5.6 Economics

Subsection 3.6.3, [Economics] Existing Conditions, describes Clallam County's recent decrease in average unemployment rate (from 8.1 percent in 2010 to 5.2 percent in 2021) and average annual increase in personal income (4.5 percent increase per year from 2011 to 2020). Levels of unemployment are higher and personal income lower in Neah Bay compared to county-wide data. There are no foreseeable future trends that may affect the present economic climate in the county or in Neah Bay.

Both tourism and fishing are important industries in the analysis area. Subsection 4.6, Economics, analyzes the potential for minor temporary increases or decreases in tourism in Clallam County and Neah Bay if a gray whale hunt is authorized under Alternatives 2 through 7. It also describes no likely change in economic conditions if a gray whale hunt is not authorized under Alternative 1. According to the environmental assessment for the Makah Bay wave energy project (FERC 2007), that project would have had a positive effect on the economy in the project area.

Given the current economic climate, generally favorable economic trends in Clallam County, and that the potential effects of any of the alternatives are either nonexistent or minor and temporary, we conclude that when the effects of past, present, and reasonably foreseeable future actions are added to the direct and indirect effects of Alternatives 1 through 7, the incremental effects of Alternatives 1 through 7 are not likely to be different from the effects described in Section 4, Environmental Consequences. We, therefore, do not expect there would be significant cumulative effects on the economics of the cumulative effects analysis area.

5.7 Environmental Justice

Subsection 4.7, Environmental Justice, describes the potential effects on the Makah Tribe (the population of concern for purposes of considering Executive Order 12898, Environmental Justice) of the No-action Alternative and the six action alternatives. Because the Makah Tribe has requested authorization of a whale hunt, impacts to the Tribe under the action alternatives are not an issue of concern under the Executive Order. However, it is likely that the Makah Tribe would experience negative cumulative effects under the No-action Alternative for the reasons described under Subsection 5.10, Ceremonial and Subsistence Resources.

5.8 Social Environment

As described in Subsection 3.8, Social Environment, various groups and individuals have different opinions about hunting whales. NMFS received public comments about the hunt from a broad geographic area—public scoping occurred near the action area and in Washington D.C. Makah tribal members and other tribes generally support the hunt, while the general public has mixed feelings about the issue. Subsection 4.8, Social Environment, analyzes the potential for these different groups to experience both increased social conflict and increased social bonding, within the groups and outside the groups, under any of the alternatives. Other social issues exist that may have caused conflict or bonding within or among these groups in the past, and new issues are likely to arise in the future. Therefore, we conclude that social events are too speculative to inform a cumulative impact analysis. For the reasons described above, we conclude that when the effects of past, present, and reasonably foreseeable future actions are added to the direct and indirect effects of Alternatives 1 through 7, the incremental effects of Alternatives 1 through 7 are not likely to be different from the effects described in Section 4, Environmental Consequences. We, therefore, do not expect there would be significant cumulative effects on the social environment.

5.9 Cultural Resources

As analyzed in Subsection 4.9, Cultural Resources, no adverse effects are expected to cultural resources if hunting is authorized under Alternatives 2 through 7. Some beneficial effects are possible to both listed and unlisted cultural sites historically used for whaling-related ceremonies if hunting is authorized. These sites are also used for other non-whaling activities.

For the reasons described above, we conclude that when the effects of past, present, and reasonably foreseeable future actions are added to the direct and indirect effects of Alternatives 1 through 7, the incremental effects of Alternatives 1 through 7 are not likely to be different from the effects described in Section 4, Environmental Consequences. We, therefore, do not expect there would be significant cumulative effects on cultural resources.

5.10 Ceremonial and Subsistence Resources

Subsection 3.10.3, [Ceremonial and Subsistence Resources] Existing Conditions, describes the past and current status of Makah subsistence and ceremonial practices, including a history of such practices being discouraged by U.S. government policy and a recent resurgence in such practices. It also describes the prestige accorded whaling families in traditional Makah society. Subsection 4.9, Cultural Resources, examines the potential for resumption of whaling under Alternatives 2 through 7 to enhance the Tribe's subsistence and ceremonial practices and, conversely, for implementation of Alternative 1 (no authorized hunting) to detract from these practices. Future policies of the U.S. government are difficult to predict, as are future trends in the values of the dominant culture that may affect Makah ceremonial and subsistence practices. It is also not possible to predict the availability of subsistence resources in the future, although it is likely that resources will shift as global climate change affects the ocean ecosystem. It is possible that a denial of the Tribe's request under Alternative 1, when added to the legacy of U.S. government policies discouraging subsistence and ceremonial practices, would have negative cumulative effects beyond the effects of alternatives analyzed in Subsection 4.10, Ceremonial and Subsistence Resources.

5.11 Noise

Subsection 3.11, Noise, describes the relevant noise-related policies and jurisdictions, sensitive noise receptors, and background noise conditions in the project area. Of the actions reviewed in our cumulative impact analysis, those that contribute to noise levels do so primarily via vessel noise (e.g., shipping, military exercises, fishing, and scientific research) or sonar and detonations during Navy training and testing. All of these sources of noise are unpredictable in terms of time, location, and intensity. Under Alternatives 2 through 7, there may be some localized, temporary increases in noise levels because of hunt-related vessel traffic, media and protest activity, and rifle shots or grenade explosions. However, it is likely that the increased amount of noise associated with vessel traffic would be masked by high ambient noise levels (e.g., natural sounds, such as those of wind and surf and existing sources of anthropogenic noise such as commercial shipping). Rifle shots and grenade explosions would produce high-intensity noise but it would be of short duration. It is not possible to predict noise levels associated with protest activities, but they would also likely be localized and temporary (and subject to control by law enforcement if protest activities were to pose an imminent threat to public safety).

For the reasons described above, we conclude that when the effects of past, present, and reasonably foreseeable future actions are added to the direct and indirect effects of Alternatives 1 through 7, the incremental effects of Alternatives 1 through 7 are not likely to be different from

the effects described in Section 4, Environmental Consequences. We, therefore, do not expect there would be significant cumulative effects on noise.

5.12 Aesthetics

Under Alternatives 2 through 7, there may be some temporary aesthetic effects to people viewing gray whale hunts through the media or from local vantage points both inside and outside of the action area. There are currently no issues identified in the action area related to aesthetics, and those outside of the action area were addressed as a direct or indirect effect from media coverage or vantage points.

For the reasons described above, we conclude that when the effects of past, present, and reasonably foreseeable future actions are added to the direct and indirect effects of Alternatives 1 through 7, the incremental effects of Alternatives 1 through 7 are not likely to be different from the effects described in Section 4, Environmental Consequences. We, therefore, do not expect there would be significant cumulative effects on aesthetics.

5.13 Transportation

Under Alternatives 2 through 7, there may be some localized, temporary effects on highway traffic in the action area, but no land-based transportation effects would occur outside of the action area. Marine and air traffic effects outside of the action area were also analyzed in Section 4, Environmental Consequences.

For the reasons described above, we conclude that when the effects of past, present, and reasonably foreseeable future actions are added to the direct and indirect effects of Alternatives 1 through 7, the incremental effects of Alternatives 1 through 7 are not likely to be different from the effects described in Section 4, Environmental Consequences. We, therefore, do not expect there would be significant cumulative effects on transportation.

5.14 Public Services and Public Safety

Under Alternatives 2 through 7, there may be some localized, temporary effects on police services in the action area, but no strains are anticipated on medical services in either the action area or on medical services in larger cities outside of the action area. It is not anticipated that localized needs for police services under any of the action alternatives would require additional services from law enforcement sources outside of the area analyzed in Section 4, Environmental Consequences.

For the reasons described above, we conclude that when the effects of past, present, and reasonably foreseeable future actions are added to the direct and indirect effects of Alternatives 1 through 7, the incremental effects of Alternatives 1 through 7 are not likely to be different from

the effects described in Section 4, Environmental Consequences. We, therefore, do not expect there would be significant cumulative effects on public safety.

5.15 Human Health

Subsection 3.16.3, Human Health, Existing Conditions, describes the levels of contamination found in gray whales and the potential for food-borne pathogens associated with the butchering, storage, and preparation of gray whale products. It also describes the nutritional benefits of gray whale food products. As discussed in Subsection 4.16, Human Health, it is not possible to evaluate the change in tribal members' exposure to contaminants or pathogens, or in their nutrition, without knowing how much or what type of whale products individuals would consume and without knowing the contaminant level and nutritional composition of their present diet. Furthermore, it is not possible to determine how past events such as a moratorium on whaling affected the overall health of the Makah Tribe because no data exist to demonstrate changes in health before and after whale hunting was allowed.

For the reasons described above, we conclude that when the effects of past, present, and reasonably foreseeable future actions are added to the direct and indirect effects of Alternatives 1 through 7, the incremental effects of Alternatives 1 through 7 are not likely to be different from the effects described in Section 4, Environmental Consequences. We, therefore, do not expect there would be significant cumulative effects on human health.

5.16 National and International Regulatory Environment

As described in Subsection 4.17, Regulatory Environment Governing Harvest of Marine Mammals, it is too speculative to conclude that NMFS' decision to authorize or not authorize a whale hunt would affect marine mammals in the United States or whaling worldwide.

For the reasons described above, we conclude that when the effects of past, present, and reasonably foreseeable future actions are added to the direct and indirect effects of Alternatives 1 through 7, the incremental effects of Alternatives 1 through 7 are not likely to be different from the effects described in Section 4, Environmental Consequences. We, therefore, do not expect there would be significant cumulative effects on the national and international regulatory environment.

Re: Makah Tribe's Request for a Waiver of the Marine Mammal Protection Act (MMPA) Take Moratorium

Dear Dr. Hogarth,

Under the 1855 Treaty of Neah Bay, the Makah Tribe secured an express right to hunt whales throughout its usual and accustomed grounds and stations. The Makah Tribe's express whaling rights have not been abrogated by any subsequent statute including the Marine Mammal Protection Act (MMPA). Nevertheless, the Ninth Circuit Court of Appeals has held that, notwithstanding the Makah Tribe's express whaling rights under the Treaty of Neah Bay, the National Oceanic and Atmospheric Administration (NOAA) must waive the MMPA take moratorium before the Tribe may exercise its Treaty whaling rights. *Anderson v. Evans*, 371 F.3d 475 (9th Cir. 2004).

Consider this letter and the attached application the Tribe's formal request for a waiver of the take moratorium under Section 101(a)(3) of the MMPA, 16 U.S.C. § 1371(a)(3), to allow a ceremonial and subsistence (C&S) harvest from the Eastern North Pacific stock of gray whales (*Eschrichtius robustus*) within the Makah Tribe's adjudicated usual and accustomed grounds. *See United States v. Washington*, 626 F.Supp. 1405, 1467 (W.D.Wash. 1985). The total take of gray whales for which the Tribe seeks a waiver is up to 20 gray whales in any five-year period subject to a maximum of five gray whales in any calendar year.

In accordance with Section 101(a)(3) of the MMPA, the Tribe asks you to determine that it is compatible with the Act to waive the moratorium to allow for the taking of whales requested in this letter and attached application, and to adopt suitable regulations and make determinations in accordance with Sections 102, 103, and 104 of the Act. We also ask you to simultaneously undertake a National Environmental Policy Act review of the Tribe's request.

The Tribe believes that approval of this request is consistent with the purposes and policies set forth in Section 2 of the MMPA and is necessary for the United States to fulfill its fiduciary obligations to the Tribe under the Treaty of Neah Bay. As shown in the attached

application, the Tribe's requested harvest of gray whales will ensure that gray whales remain a significant functioning element in the ecosystem and will not permit the Eastern North Pacific gray whale stock to fall below its optimum sustainable population.

The Tribe thanks you in advance for your attention to this important matter.

Sincerely,

MAKAH TRIBAL COUNCIL

Executive Summary

This document constitutes the application of the Makah Indian Tribe (the "Tribe") under Section 101(a)(3) of the Marine Mammal Protection Act (MMPA), 16 U.S.C. § 1371(a)(3), for a waiver of the moratorium on the taking of marine mammals which would allow the Tribe to conduct a Treaty ceremonial and subsistence (C&S) harvest of up to 20 gray whales from the Eastern North Pacific (ENP) stock in any five-year period, with a maximum of five whales per year. The proposed waiver would be subject to permanent regulations adopted by the Secretary of Commerce under Section 103 of the MMPA, 16 U.S.C. § 1373, which would authorize the National Oceanic and Atmospheric Administration (NOAA) to issue the Tribe a renewable whaling permit of up to five years in duration under Section 104 of the MMPA, 16 U.S.C. § 1374, provided that the Tribe enacts, implements, and enforces Tribal regulations which meet minimum standards necessary to conserve the ENP stock, avoid local depletion, and ensure a safe and humane hunt. These standards will include:

- Limits on the total number of gray whales that may be struck in a calendar year;
- Time and area restrictions designed to avoid any intentional harvest of gray whales comprising the Pacific Coast Feeding Aggregation (PCFA);
- Monitoring and adaptive management measures designed to ensure that any incidental harvest of gray whales from the PCFA remains below an annual allowable bycatch level (ABL) that will be conservatively established by applying the MMPA's potential biological removal (PBR) methodology to a conservative abundance estimate which is based on the number of gray whales that exhibit inter-annual site fidelity to the Oregon to Southern Vancouver Island (ORSVI) survey area;
- Measures that will ensure that the hunt is as humane as practicable consistent with the continued use of traditional hunting methods; and
- Measures to protect public safety.

The Makah Tribe has at least a 1,500-year-old whaling tradition and secured an express right to take whales under Article IV of the 1855 Treaty of Neah Bay. The Tribe's Treaty whaling rights have not been abrogated by the MMPA or any other federal statute. Under well-established case law, these rights are subject to restriction only where necessary to prevent demonstrable harm to a particular stock or species of whales.

Nevertheless, in *Anderson v. Evans*, 371 F.3d 475 (9th Cir. 2004), the Ninth Circuit Court of Appeals decided that the Tribe must obtain a waiver of the MMPA's take moratorium before it may exercise its Treaty whaling rights. The Tribe strongly disagrees with the Court's holding, but is filing this application to provide a legal framework that will allow for long-term exercise of its Treaty whaling rights consistent with the conservation needs of the gray whale. Approval of this waiver request is needed to meet the Tribe's cultural and subsistence needs and to fulfill the

United States government's Treaty and trust obligations to the Tribe.

The population of Eastern North Pacific stock of gray whales is at its historic levels and within its optimum sustainable population (OSP). After accounting for the Makah whale hunt, the total human-caused mortality, which includes aboriginal subsistence harvest by native groups in Russia, will be just over a third of the stock's PBR level of 366 whales. The Scientific Committee of the IWC provided management advice in 2002 that a take of up to 463 whales per year is sustainable for at least the medium term (~30 years). This level of harvest is over 350 percent higher than the average annual joint US-Russian quota of 124 whales per year. Because there is no likelihood that the Makah whale hunt will cause the Eastern North Pacific stock to fall below OSP in the foreseeable future, the Tribe's waiver request is well within the Tribe's rights under the Treaty of Neah Bay and is consistent with the policies and requirements of the MMPA.

For the purposes of this application, the Pacific Coast Feeding Aggregation (PCFA) is defined as any whale found in NOAA's photo-identification database which has been observed south of Alaska from June 1 through November 30 in any year. The PCFA is not a discrete stock of whales for the purposes of the MMPA. Nevertheless, the Tribe has agreed to safeguards that will prevent any intentional harvest of gray whales that exhibit inter-annual site fidelity to the Pacific coast south of Alaska. The Tribe will allow whale hunting only during established gray whale migration periods (December 1 through May 31) and prohibit hunting in gray whale feeding grounds in the Strait of Juan de Fuca.

To minimize the risk of incidental harvest of whales from the PCFA and ensure that gray whales remain a functioning element of the ecosystem, the Tribe in consultation with NOAA will compare photographs of all landed whales with NOAA's photo-identification database for the PCFA. The Tribe will suspend the hunt in a calendar year if necessary to prevent the harvest of whales found in the PCFA database from exceeding an annual allowable bycatch level (ABL). The ABL will be calculated by applying the MMPA's PBR methodology to a conservative abundance estimate based on the number of gray whales that are seen in more than one year in the Oregon-Southern Vancouver Island (ORSVI) survey area between June 1 and November 30.

NOAA should approve the Tribe's request for a waiver and adopt regulations that permit the Tribe to exercise its treaty rights in the manner specified in this application. The proposed waiver is necessary for the United States government to fulfill its legal obligations to the Tribe under the Treaty of Neah Bay, will not disadvantage the ENP stock of gray whales, and will be consistent with the purposes and policies of the MMPA.

Definitions.

Allowable Bycatch Level (ABL): the number of whales from the PCFA that may be taken incidental to a hunt directed at the migratory portion of the ENP stock of gray whales. The ABL is calculated using the MMPA's PBR approach but the minimum population estimate is calculated from the number of previously seen whales in the Oregon-Southern Vancouver Island (ORSVI) survey area.

Harassment: any act of pursuit, torment, or annoyance which— (i) has the potential to injure a marine mammal or marine mammal stock in the wild (referred to as Level A harassment); or (ii) has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavorial patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering (referred to as Level B harassment). 16 U.S.C. § 1362(18).

Humane Killing: that method of taking which involves the least possible degree of pain and suffering practicable to the mammal involved. 16 U.S.C. § 1362(4).

Optimum Sustainable Population (OSP): is defined as "with respect to any population stock, the number of animals which will result in the maximum productivity of the population or the species, keeping in mind the carrying capacity of the habitat and the health of the ecosystem of which they form a constituent element." 16 U.S.C. § 1362(9). NOAA has quantified OSP as a population size which ranges between a stock's maximum net productivity level (MNPL) and its carrying capacity (K). *See* 50 C.F.R. § 216.3.

Oregon-Southern Vancouver Island (ORSVI) survey area: the gray whale survey region from Oregon to Southern Vancouver Island for which abundance estimates of returning whales are used to develop the allowable bycatch level (ABL). This area was identified in Calambokidis et al. (2004) as the appropriate range to evaluate abundance estimates for the purposes of management of a Makah whale harvest and is based on gray whale interchange rates to survey areas adjacent to the Makah U&A.

Pacific Coast Feeding Aggregation (PCFA): any ENP gray whale found in the photo-identification database maintained by NOAA's National Marine Mammal Laboratory (NMML) which has been observed south of Alaska from June 1 through November 30 in any year.

Potential Biological Removal (PBR): the maximum number of animals, not including natural mortalities, that may be removed from a marine mammal stock while allowing that stock to reach or maintain its optimum sustainable population 16 U.S.C. § 1362(20). A total level of human-caused mortality that is less than the PBR is considered sustainable and consistent with the MMPA's goal of managing marine mammal stocks to achieve their OSP level. Under 16 U.S.C. § 1362(2), the PBR for a particular marine mammals stock is calculated by taking the product of the following factors: the minimum population of the stock (N_{min}); one-half the maximum theoretical or estimated net productivity rate of the stock at a small population size (R_{max}); and a recovery factor (F_r) between 0.1 and 1.0.

Strike: means any blow or blows delivered to a whale by a harpoon, rifle or other weapon which may result in death to a whale. A harpoon blow counts as a strike if the harpoon is embedded in the whale. Any rifle shot which hits a whale counts as a strike. For the purpose of this request, multiple strikes on a single whale count as a single strike.

Take: as applied to the number of whales that may be harvested, "take" is defined in accordance with the regulations of the International Whaling Commission, "to flag, buoy or make fast to a whale catcher." For all other purposes, "take" is defined according to the definition in the MMPA, which means to harass, hunt, capture, or kill, or attempt to harass, hunt capture, or kill any marine mammal. 16 U.S.C. § 1362(13).

I. Request for Waiver and Proposed Regulations.

This document constitutes the application of the Makah Indian Tribe (the "Tribe") under Section 101(a)(3) of the Marine Mammal Protection Act (MMPA), 16 U.S.C. § 1371(a)(3), for a waiver of the moratorium on the taking of marine mammals which would allow the Tribe to conduct a Treaty ceremonial and subsistence (C&S) harvest of up to 20 gray whales from the Eastern North Pacific (ENP) stock in any five-year period, with a maximum of five whales per year. The proposed waiver would be subject to permanent regulations adopted by the Secretary of Commerce under Section 103 of the MMPA, 16 U.S.C. § 1373, which would authorize the National Oceanic and Atmospheric Administration (NOAA) to issue the Tribe a renewable whaling permit of up to five years in duration under Section 104 of the MMPA, 16 U.S.C. § 1374, provided that the Tribe enacts, implements, and enforces Tribal regulations which meet minimum standards necessary to conserve the ENP stock, to avoid local depletion, and to ensure a safe and humane hunt. The term of the initial permit should coincide with the current aboriginal subsistence quota for gray whales approved by the International Whaling Commission (IWC), which runs though 2007. Future permits would be issued in synchrony with IWC aboriginal quotas, which are currently set at five-year intervals.

As discussed in greater detail in Parts II and III of this application, the Makah Tribe has at least a 1,500-year-old whaling tradition and secured an express right to take whales under Article IV of the 1855 Treaty of Neah Bay. The Tribe's Treaty whaling rights have not been abrogated by the MMPA or any other federal statute. Under well-established case law, these rights are subject to restriction only where necessary to prevent demonstrable harm to a particular stock or species of whales.

Nevertheless, in *Anderson v. Evans*, 371 F.3d 475 (9th Cir. 2004), the Ninth Circuit Court of Appeals decided that the Tribe must obtain a waiver of the MMPA's take moratorium before it may exercise its Treaty whaling rights. The Tribe strongly disagrees with the Court's holding but is filing this application to provide a legal framework that will allow for long-term exercise of its treaty whaling rights consistent with the conservation needs of the gray whale. Approval of this waiver request is needed to meet the Tribe's cultural and subsistence needs and to fulfill the United States government's Treaty and trust obligations to the Tribe.

The Tribe proposes to manage the whale hunt under Tribal regulations which meet the following minimum standards:

A. Number of Gray Whales that May Be Taken.

The Tribe's regulations will limit the number of gray whales that may be "taken," as that term is defined in IWC regulations, to no more than five in any calendar year, and to no more than 20 in any five-year period.[1] In addition, Tribal regulations will limit the number of gray whales that may be "struck," a more inclusive term that encompasses all whales that are "taken," to no

[1] Under the IWC Schedule, the term "take" means to flag, buoy or make fast to a whale catcher.

more than seven in any calendar year.[2] The Tribe's regulations will limit the number of struck and lost whales to no more than three in any calendar year. The number of gray whale takes and strikes allowed by Tribal regulation will be subject to reduction if necessary to meet the international treaty obligations of the United States under the International Convention for the Regulation of Whaling (ICRW) or to prevent the abundance of the ENP stock from falling below its optimum sustainable population level (OSP). Tribal regulations will not allow the taking of any other species of whales except gray whales.

B. Age, Size, and Sex of Gray Whales that May Be Taken.

Tribal regulations will prohibit the striking of a whale calf, or any whale accompanied by a calf.

C. Season When Gray Whales May Be Taken.

The Tribe's regulations will prohibit the striking of a gray whale between June 1 and November 30 of any calendar year. The purpose of this restriction is to prevent the intentional harvest of whales that may be part of the Pacific Coast Feeding Aggregation (PCFA).

D. Manner and Location in which Gray Whales May Be Taken.

The Tribe's regulations will prohibit the striking of a gray whale outside of the Tribe's usual and accustomed (U&A) grounds as adjudicated in *United States v. Washington*, 626 F.Supp. 1405, 1467 (W.D. Wash. 1985). The Tribal regulations will also prohibit the striking of a gray whale within the Strait of Juan de Fuca. Hunting will only occur in the waters of the Pacific Ocean bounded by the following line: a line beginning at the northwestern tip of Cape Flattery running to the Tatoosh Island Lighthouse; from the Tatoosh Island Lighthouse to the buoy adjacent to Duntze Rock; from the buoy adjacent to Duntze Rock following a straight line to Bonilla Point on Vancouver Island but stopping at the Exclusive Economic Zone (EEZ); tracking the EEZ boundary westward to 125° 44'00" longitude; south along 125° 44'00" longitude to 48° 02'15" latitude; east along 48° 02'15" latitude to shore; and then track the shoreline northward to point of origin at Cape Flattery.

To further reduce the risk of local depletion, Tribal regulations will provide for detailed photographic monitoring of all landed whales. As soon as practicable after a successful hunt, in consultation with scientists from NOAA's National Marine Mammal Laboratory (NMML) the Tribe will compare photographs of landed whales with the NMML photo-identification catalog for the Pacific Coast Feeding Aggregation (PCFA), which includes any gray whale that has been photographed south of Alaska between June 1 and November 30 in any year. The Tribe will cease hunting in a calendar year when photographic analysis indicates that suspension of the hunt

[2] For the purposes of this request, the term "strike" means any blow or blows delivered to a whale by a harpoon, rifle or other weapon which may result in death to a whale. A harpoon blow counts as a strike if the harpoon is embedded in the whale. Any rifle shot which hits a whale counts as a strike. (Makah Tribal Council 2001).

is necessary to prevent the number of harvested whales from the PCFA catalog from exceeding an annual allowable bycatch level (ABL) for that year. The ABL will be calculated by applying the MMPA's PBR methodology to a conservative abundance estimate based on the number of gray whales that exhibit site fidelity (i.e., seen in more than one year) in the Oregon to Southern Vancouver Island (ORSVI) survey area between June 1 and November 30.

The Tribe's regulations will also include measures that will ensure that the hunt is conducted in the most humane manner practicable consistent with the Tribe's goal of providing opportunities for a traditional ceremonial and subsistence hunt. To this end, all whales will be harpooned with a toggle-point harpoon with floats attached before being dispatched with a .50 caliber rifle shot to the central nervous system (brain and upper spinal cord). During the 1999 hunt these methods resulted in a time to death of approximately 8 minutes. The Tribe anticipates that the time to death will improve as its hunters gain additional experience.

To address concerns about impacts to nesting seabirds, no whale may be struck within 200 yards of Tatoosh Island or White Rock during the month of May. The Tribal regulations will also include measures to ensure that the hunt is conducted in a manner which is at least as protective of public safety as the measures provided for in the Tribe's 2001 Gray Whale Management Plan (Makah Tribal Council 2001).[3] Further management measures to address public safety and possible impacts to other species may be developed based on the outcome of NOAA's National Environmental Policy Act (NEPA) review of the Tribe's request.

E. Other requirements.

The Tribe's regulations will restrict the use of whale products to local consumption and ceremonial purposes in accordance with section 102(f) of the MMPA. 16 U.S.C. § 1372(f). No whale products will be sold or offered for sale, except that traditional handicrafts (including artwork) made from non-edible whale products may be sold or offered for sale within the United States. The Tribe requests a limited waiver from the MMPA's prohibition on the sale of marine mammal products for the purposes of selling such traditional handcrafts. The requested waiver would be similar to, but more restrictive than, the exemption for Alaska native handicrafts provided in Section 101(b)(2) of the MMPA, 16 U.S.C. § 1371(b)(2).

The Tribe's regulations will include a permit system which provides that no Tribal member may engage in whaling except under the control of a whaling captain who is in possession of a valid whaling permit issued by the Makah Tribal Council. Whaling permits issued by the Council must incorporate and require compliance with all of the requirements of the Tribe's regulations.

Tribal regulations will provide for a training and certification process for all members who

[3] These measures authorized the discharge of firearms when whaling only when the shooter was within 30 feet of the target area of the whale and the shooter's field of view was clear of all persons, vessels and other objects that could result in injury or loss of human life. The measures also set minimum visibility standards for the hunt. (Makah Tribal Council 2001).

participate in whaling.

Tribal regulations will offer accommodations for a NOAA Fisheries observer during all hunts, including providing the designated observer from NOAA Fisheries with at least 24 hours notice of the issuance of any whaling permit unless the observer is already present on the Makah Reservation. The regulations will also allow NOAA Fisheries to collect specimen material from landed whales, including ovaries, ear plugs, baleen plates, stomach contents, and other tissue samples.

Tribal regulations will include provisions for Tribal monitoring of all hunts and annual reporting of all monitoring data to NOAA Fisheries. At a minimum, Tribal monitoring will include maintaining accurate records of the time, date, and location of all strikes; the body length, fluke width, and sex of all landed whales and any fetus found in a landed whale; and the time to death for all whales killed. As indicated previously, all landed whales will be photographed to allow comparison with the NMML photographic database compiled for the PCFA.

Tribal regulations will include provisions requiring Tribal enforcement of the regulations. The enforcement regulations shall include criminal sanctions, including fines and imprisonment, up to the limits imposed by the Indian Civil Rights Act.

II. Purpose of and Need for the Waiver Request.

The purpose of the Tribe's application for a waiver of the take moratorium is to obtain authorization under the MMPA for a Treaty C&S harvest of up to 20 gray whales in any five-year period from the Eastern North Pacific (ENP) stock, with a maximum of five gray whales per year. As decided by the Ninth Circuit Court of Appeals in *Anderson v. Evans*, 371 F.3d 475 (9th Cir. 2004), a waiver of the MMPA's take moratorium is necessary for the Tribe to exercise its express whaling rights under Article IV of the Treaty of Neah Bay. Approval of this request is needed to satisfy the United States government's obligations to the Tribe under the 1855 Treaty of Neah Bay and the federal trust responsibility, and to fulfill the Tribe's cultural and subsistence needs which are discussed below and in the attached need statement submitted to the IWC in 2002 (Appendix A; Renker 2002).

A. The Tribe's Cultural and Subsistence Needs.

As discussed in further detail in Appendix A, the Tribe has at least a 1,500-year whaling tradition. Whaling was central to the Tribe's way of life, providing a primary means of subsistence as well as essential social and cultural functions.[4] Whaling was so important to the Tribe that it expressly reserved whaling rights in the 1855 Treaty of Neah Bay. Although Makah whaling declined in the decades after the Treaty due to forces beyond the Tribe's control, the Makah people have never forgot their whaling traditions. Over the past two decades, the Tribe has begun to restore its language, songs and dances and many other cultural traditions. The resumption of whaling in the late 1990s has brought the Tribe significant cultural and social benefits as well as a badly needed subsistence resource. Approval of this waiver application, which seeks a harvest of up to five gray whales per year from the ENP stock, would enable the Tribe to continue its cultural renaissance and provide significant nutritional resources to an economically deprived community.

1. The Makah Tribe's Whaling Tradition.

The relationship between the Makah people and whaling is of great antiquity. The Ozette archeological site on the northern Washington coast contains evidence of some 1,500 years of continuous whaling. Archeological and ethnohistorical data demonstrate that the Makah hunted gray whales as well as other whale species. The number of whales taken by Makah whalers varied from year to year. Based on historic documents, it is estimated that Makah whalers averaged about 5.5 whales per year between 1889 through 1892, a time when the gray whale population had already been substantially reduced by non-Indian commercial whaling. Whaling for gray whales occurred during both the fall and spring migrations, with some hunts occurring 30 or more miles from shore.

The Makah hunted whales from giant canoes, approximately 36 feet long and more than 5

[4] The discussion in this section is taken from Renker (2002). Readers are directed to Appendix A for a list of references for this section.

feet wide, which were carved from a single cedar log. Other equipment included mussel-shell harpoons, sealskin floats, fathoms of line made from whale sinew and cedar, and a variety of knives. Whaling equipment and methods were constantly evolving. After contact with Euro-Americans, Makah whalers began to use metal harpoon heads at the ends of their traditional wood harpoons and accepted tows from steamers to and from the whaling grounds.

A whaling crew consisted of a chief, or "whaler," and seven men. The whaler owned the canoe and the whaling equipment and acted as the sole harpooner. Other crew members included a steersman, a man responsible for managing the lines and buoys, numerous paddlers, and a man who had the unique responsibility of diving into the water and fastening the whale's mouth shut after the whale was killed.

The whale was initially harpooned behind the front flipper. Once the first harpoon had been driven into the whale and the first set of floats attached, the whale was pursued and killed with a long wooden lance. The process of killing a whale could take up to three to four days. Once killed, the whaling crew had to tow the animal back to land, a process which could take another two days. Whales were butchered according to strict protocols, which identified the sequence of the butchering, the portions of the whale reserved for ceremonial use, and the portions to be distributed to the crew and other village inhabitants.

Positions on whaling crews were restricted to men who could withstand the rigors of intensive ritualized training, possessed the hereditary access to the position and its ritualized knowledge, or underwent a supernatural encounter which engendered the gift of whaling ability. All crew members undertook rigorous ceremonial and spiritual preparations prior to the hunt; the success of the hunt depended as much on the observance of rituals as the strength and skill of the whalers. The families of the whalers were also expected to observe rituals to ensure the safety and success of the hunters.

Whaling was the keystone of traditional Makah society. Makah society was mirrored in the structure of the whale hunt, including ceremonial preparation, the hunt itself, and the ultimate acts of butchering and distribution. Whalers, or headmen, were ranked at the top of the social pyramid. Whaling success translated into physical wealth and social prestige for the headman. Women married to whalers likewise dominated the top of the female status pyramid. Ceremonies to prepare whalers and their families for the hunt provided the Makah with a social framework that contributed to governmental, social, and spiritual stability.

In addition to its cultural and social benefits, whaling provided the Makah with an essential subsistence resource. Archeological studies show that as much as 85 percent of the Makah pre-contact diet could have been composed of whale meat, oil and other food products. Whale blubber and oil also provided an important source of trade goods. Whale products insured that the Makah enjoyed a high standard of living and a diversified economy.

2. The Treaty of Neah Bay.

In the early 19th century, as non-Indian traders and explorers entered the waters of the

Northwest, the Makah experienced increasing demand for whale products. The Makah expanded their trade in whale oil and other whale products in response to this demand, selling whale oil to the Hudson's Bay Company and other trading outfits.

In early 1855, the Makah were approached by the United States government, through Washington Territorial Governor Isaac Stevens, for the purpose of negotiating a treaty of land cession. From the government's perspective, the purpose of the treaty was to gain title to the region's rich lands and resources in order to make way for non-Indian settlement. While the Makah were willing to sell most of their lands to the United States, the Tribe insisted on retaining its rights to harvest the bountiful marine resources upon which it depended for its existence. To gain Makah acceptance of the treaty, Governor Stevens repeatedly insisted that the government did not intend to stop the Makah from whaling, sealing and fishing, but in fact would help them to develop these pursuits.

Much of the official record of the treaty negotiations reflects this dialogue. At the outset of the discussions, Governor Stevens proposed to buy Makah lands and establish a small reservation at the site of present-day Neah Bay. The first Makah chief to speak, Klachote, responded that the treaty must also protect his "right to fish, and take whales and get food when he liked." The next chief, Keh-tchook, seconded this demand. Governor Stevens acceded to the Makahs' demand, replying that "so far from wishing to stop their fisheries, he wished to send them oil kettles, and fishing apparatus." Governor Stevens reassured the Makah:

> I saw the Great Father a short time since and [he] sent me here to see you and give you his mind. The Whites are crowding in upon you and the Great Father wishes to give you your homes. He wants to buy your land and give you a fair price but leaving you enough to live on and raise your potatoes. He knows what whalers you are, how you go far to sea, to take whales. He will send you barrels in which to put your oil, kettles to try it out, lines and implements to fish with — . . . [T]his will be done if we sign it [the treaty]. If it is good I shall send it to the Great Father, and if he likes it he will send it back with his name. When it is agreed to it is a bargain.

Based on the government's assurances that their whaling rights would be protected, the Makah's agreed to sign the 1855 Treaty of Neah Bay, 12 Stat. 939 (Jan. 31, 1855) (Appendix B). The Treaty was ratified, without alterations, on March 8, 1859. From the Makah perspective, the critical clause of the treaty was Article IV, which provides:

> The right of taking fish *and of whaling* or sealing at usual and accustomed grounds and stations is further secured to said Indians in common with all citizens of the United States. . . [emphasis added].

Governor Stevens' promise of government assistance with their whaling, sealing and fishing industries was also a significant inducement to the Makah because it allowed for further expansion of the Tribe's existing whaling and fishing enterprises. Significantly, of all of the many Stevens Treaties -- and of all treaties between the United States and Indian tribes -- the Treaty of

Neah Bay is the only one which expressly secures tribal whaling rights.

3. The Decline of Makah Whaling.

Despite Governor Stevens' promises, the United States failed to provide support for Makah fishing, whaling and sealing. Government assistance emphasized agricultural implements rather than items that could have supported the active components of the Makah's maritime economy. Instead of whaling and fishing tools, the Makah received pitchforks, scythes, hoes and sickles. Since the Makah Reservation was unsuited to cultivation, the Makah converted the tines of the pitchforks into fish hooks, the scythes into blubber knifes, and the sickles into arrowheads.

Federal Indian policy in the late 19th century was devoted to changing the Makah and other Indians from self-sufficient hunter-gatherers into farmers, dependent on the government for tools and instruction. Indian policy was also designed to assimilate Indian people through an education system that prohibited use of Indian languages or the exercise of cultural rituals. Despite the Treaty of Neah Bay's recognition of whaling as an important facet of Makah life, the United States government chose not to support the Tribe's well-developed practice.

Indoctrination in government-run boarding schools also worked against traditional subsistence whaling, as did epidemics and government bans on ceremonial activities. Potlatches and secret societies were prohibited, disrupting the Makah system of proprietary rights over dances, songs, and other ceremonies. At the same time that government policy was aimed at converting the Makah to agriculturalists, Pacific whale populations were declining as a result of increased commercial whaling by non-Indians. In 1854, Captain Charles Scammon discovered the Mexican breeding grounds of the gray whale. Gray whale cows and calves were slaughtered in the breeding lagoons bringing about the decimation of the Eastern North Pacific gray whale stock over the next few decades.

During this time, whale hunting remained the symbolic heart of Makah culture but continued to diminish in frequency as it became cost-prohibitive. As whale populations declined, the Makah shifted their resources to pursue more lucrative seal hunting. By the 1890s, Makah schooners were hunting fur seals along the Washington coast and as far north as the Bering Sea.

In short, boarding-school indoctrination and government acculturation policies, combined with a series of devastating epidemics, drastically changed the delicate and complex social dynamic which had supported the traditional Makah whale hunt. These factors, especially when juxtaposed with the severe decline in whale populations, served to discourage the Makah from making the substantial investments needed to pursue traditional whaling.

4. The Tribe's Present Cultural and Subsistence Need for Whaling.

Despite the decline of whaling, the Makah Tribe's interest in retaining their whaling rights and traditions never dissipated. Families passed on whaling stories, traditions, and secrets. The Makah never stopped educating their children about their family whaling traditions. Public schools on the reservation have included whaling in their curricula since the 1960s, with

continuous efforts since 1981. Whaling designs and crests still decorate public buildings and private homes. The whaling displays in the Makah Tribe's museum have kept the tradition of whaling alive.

For the past three decades, the Makah have been engaged in a concerted effort to revive their cultural traditions. The Tribe believes that revival of these traditions is needed to combat the social disruption resulting from the rapid changes of the past century and a half. Teenage pregnancies, high school dropouts, substance abuse problems, and an increasing juvenile crime rate indicate that the Makah community is still in flux and that the enormous social disruption caused by epidemics, boarding schools, and federal acculturation policy is still not over. Entire social, cultural, subsistence, and ceremonial institutions were repressed, eradicated, or decimated; without substitution of structural equivalents.

To reverse these disturbing trends, the Makah have reinstituted numerous song, dance and artistic traditions and operated a program to restore the Makah language to spoken proficiency on the reservation. The Makah Cultural and Research Center has been instrumental in the revival of many cultural traditions. Given the centrality of whaling to the Tribe's culture, a revival of subsistence whaling is necessary for the Makah to complete this spiritual renaissance and repair the damage done to the Tribe's social structure during the years of forced assimilation. A recent survey showed that this view is supported by a majority of Makah households.[5]

Continuation and expansion of subsistence whaling will also help address the socioeconomic deprivation experienced by many tribal members. The seasonal unemployment rate on the Makah Reservation is 51 percent, with almost 49 percent of Makah households living in poverty and 59 percent living in substandard housing. According to the 2000 census, median household income on the reservation is approximately $24,000 compared with $46,000 for Washington state as a whole.

Both historically and today, the Makah have addressed economic deprivation by relying on the sea for subsistence. Currently, 85 percent of Makah households have someone in their household who fishes and 63 percent of these households list fishing as the major occupation in their home. Even households without a fisherman derive food, money, or other goods from a fisherman who is a relative or a friend. Fish is a medium of exchange on the reservation and all Makah households participate in reciprocal networks that involve fish at some level of exchange.

A majority of Makah households use traditional Makah foods at least once a week. These include such unique traditional foods as fermented salmon eggs, smoked fish heads and backbones, halibut cheeks and gills, and dried fish. According to a recent analysis, the Makah's annual per capita consumption of fish is 126 pounds, some eight times higher than for the average American. While seafood comprises 55 percent of the Makah diet, it represents only 7 percent of the diet of the average American.

---

[5] According to the 2000 census, there are 1356 Makahs living in 471 households on the Reservation. Another 1,117 Makahs live off the Reservation.

Information regarding the Tribe's successful whale hunt in 1999 illustrates the potential for wide-ranging cultural and subsistence benefits from whaling. Thirty-nine percent of households indicated that they participated in whaling-related ceremonial activities, 30 percent of households have cooked whale meat, and 81 percent of Tribal members reported having eaten whale products. An overwhelming number of community members were present when the first whale was landed at Neah Bay in 1999 and 80 percent attended the Tribal celebration of the first whale hunt. Most Makah surveyed felt that the restoration of whaling had improved social and cultural conditions on the Reservation. These data demonstrate that the Makah are fully capable of restoring subsistence whaling to a central place in their culture, economy, and way of life.

B. The Tribe's Recent Efforts to Exercise Its Whaling Rights.

Gray whales were first given international protection from commercial whaling in 1937. By 1993, NOAA determined that the Eastern North Pacific (ENP) stock of gray whales had recovered to near its estimated original population size. 58 Fed. Reg. 3121 (Jan. 7, 1993). NOAA removed the ENP stock from its list of endangered and threatened species on June 16, 1994. 59 Fed. Reg. 21,094.

Once NOAA determined that the protections of the Endangered Species Act were no longer necessary, the Tribe notified NOAA that it wished to reinitiate a ceremonial and subsistence gray whale hunt. Although the Tribe had an express treaty right, the Tribe chose to move forward in cooperation with the United States government and seek an aboriginal subsistence whaling quota from the IWC. In 1996, NOAA agreed to seek IWC approval of a quota of five gray whales per year for the Tribe. The Tribe agreed in turn that if the IWC granted the quota, the Tribe would use the whales only for subsistence purposes and would cooperatively manage the hunt with the Federal government. The United States presented the Tribe's quota request to the IWC at its 1996 meeting but the IWC failed to approve the proposal.

In 1997, NOAA entered into a new agreement with the Makah Tribe. To address public concerns about so-called "resident" whales, the new agreement provided that whaling would occur only in the "open waters of the Pacific Ocean." NOAA also published an environmental assessment (EA) which concluded that the Makah whaling proposal would result in no significant environmental impacts.

At the 1997 IWC meeting, the Tribe's quota request was included as part of a joint United States-Russian proposal for a block quota of 620 whales over the five year period from 1998 through 2002. The United States and Russia explained to the IWC that 20 whales from this joint quota would be made available to the Makah Tribe subject to a cap of five whales per year. On October 23, 1997, the IWC approved the joint quota request by consensus. The IWC renewed the joint quota for another five years (2003-2007) at its 2002 meeting.

After the IWC approved the quota, the Makah Tribe adopted a gray whale management plan that included measures to ensure a humane hunt, such as requiring the use of a high-powered rifle, as well as training requirements, a permit system, and monitoring and enforcement

provisions. In 1998, NOAA published a domestic quota of five gray whales per year for the Makah Tribe. 63 Fed. Reg. 16,701 (Apr. 6, 1998). Tribal whalers began preparing for the hunt in 1998 but no hunting occurred until the spring of 1999. In May 1999, a Tribal whaling crew hunted on four occasions and struck one gray whale. Once struck, the whale was dispatched eight minutes later with a high-powered rifle. The whale was towed back to Neah Bay where ceremonies were held, the whale was butchered, and the meat and blubber were distributed and consumed throughout the community. No additional whale hunting occurred in 1999. Two crews hunted on at least seven different occasions during the spring of 2000 but no whales were struck or landed.

On June 9, 2000, a divided panel of the Ninth Circuit reversed an earlier district court decision and held that NOAA violated the National Environmental Policy Act by entering into an agreement with the Tribe committing the government to support the Tribe's whaling proposal before the government had completed an EA. *Metcalf v. Daley,* 214 F.3d 1135, 1145 & n.3 (9th Cir. 2000). The majority did not identify any specific deficiency in the government's environmental analysis. As a remedy, the Court ordered NOAA to "suspend implementation" of the cooperative agreement, and "prepare a new EA." *Id.* at 1146.

The Tribe suspended its hunt immediately after the Ninth Circuit's ruling. NOAA rescinded the cooperative agreement and began work on a new EA. In response to public comments, NOAA consulted with the Tribe and expressed concerns about the impact of the hunt on the Pacific Coast Feeding Aggregation (PCFA), a group of approximately 200 to 250 gray whales that forage in the summer along the Pacific coast rather than migrating to more northerly feeding grounds in the Bering Sea. Although NOAA found no scientific basis to treat the PCFA as a discrete stock of marine mammals, NOAA advised the Tribe that it intended to evaluate the impacts of the Tribe's hunt on the PCFA. The Tribe addressed these concerns by revising its Management Plan to limit the number of whales that could be struck outside of whale migration periods or in the Strait of Juan de Fuca to a maximum of five strikes during the years 2001 and 2002 combined (or 2.5 strikes per year) – the low end of the PBR limit for the PCFA calculated by NOAA in its 2001 EA (NMFS 2001). The Tribe also adopted additional measures in its revised Management Plan to address public concerns about the safety of the hunt (Makah Tribal Council 2001).

After the Tribe adopted its revised Management Plan, NOAA published a second EA which found that the Makah whale hunt, conducted in accordance with the revised Management Plan, would have no significant environmental impacts (NMFS 2001). After the publication of the second EA, NOAA and the Tribe negotiated a new cooperative agreement and on December 7, 2001, NOAA published a quota of five gray whales for the Makah Tribe for the year 2002. 66 Fed. Reg. 64,378 (Dec. 13, 2001).

The new EA and quota were challenged in *Anderson v. Evans*, 371 F.3d 475 (9th Cir. 2004). The United States District Court for the Western District of Washington upheld NOAA's issuance of the quota and the second EA. However, the Ninth Circuit Court of Appeals reversed. The Ninth Circuit held that, notwithstanding the Tribe's whaling rights under the Treaty of Neah Bay, the Secretary of Commerce must waive the MMPA moratorium on taking marine mammals

and a issue a permit under the MMPA before NOAA can authorize a tribal harvest of gray whales for ceremonial and subsistence purposes. In addition, the court held that NOAA should have prepared an Environmental Impact Statement (EIS) before authorizing a Makah gray whale quota because there were questions over the local impacts of the hunt on the gray whales that feed off of the Washington coast. The Court emphasized that it was *not* holding that the Tribe's treaty right to take whales had been abrogated, but only that NOAA must follow the MMPA waiver and/or permit process before permitting the Tribe to exercise that right. This waiver application is intended to address the requirements imposed by the *Anderson* decision.

III. Applicable Law.

A. Treaty of Neah Bay.

The Treaty of Neah Bay (Appendix B) is the only treaty between the United States and an Indian Tribe which expressly reserves the right to hunt marine mammals. Article IV of the Treaty of Neah Bay provides:

> The right of taking fish *and of whaling* or sealing at usual and accustomed grounds and stations is further secured to said Indians in common with all citizens of the United States. . .

12 Stat. at 939 (emphasis added).

The Tribe's whaling and sealing rights under the Treaty of Neah Bay have not been abrogated by the MMPA. "Absent explicit statutory language, [the Supreme Court] has been extremely reluctant to find congressional abrogation of treaty rights." *Washington v. Washington Commercial Passenger Fishing Vessel Ass'n*, 443 U.S. 658, 690 (1979). In order to abrogate Indian treaty rights, Congress must make its intention to abrogate those rights "clear and plain." *United States v. Dion*, 476 U.S. 734, 738-39 (1986). Thus, where a statute does not expressly abrogate Indian treaty rights, "[w]hat is essential is *clear evidence* that Congress *actually considered* the conflict between its intended action on the one hand and Indian treaty rights on the other, and *chose* to resolve that conflict by abrogating the treaty." *Id*. at 740 (emphasis added); *see also Minnesota v. Mille Lacs Band*, 526 U.S. 172, 202 (1999).

There is no evidence that Congress was even aware of the Makah Tribe's unique treaty right to take marine mammals when it enacted the MMPA, much less that it *chose* to abrogate those rights. On the contrary, neither the MMPA nor its legislative history even mention Indian treaty rights until Congress amended the MMPA in 1994. Far from abrogating those rights, the 1994 Amendments expressly preserved them. Section 14 of the 1994 Amendments provides: "Nothing in this Act including any amendments to the Marine Mammal Protection Act of 1972 made by this Act alters or is intended to alter any treaty between the United States and one or more Indian Tribes." Pub. L. 103-238, § 14 (Apr. 30, 1994); *see* Historical and Statutory Notes to 16 U.S.C. § 1361. Congress' stated intent in enacting this disclaimer was to "reaffirm that the MMPA does not in any way diminish or abrogate protected Indian treaty fishing or hunting rights." S. Rep. No. 220, 103rd Cong., 2nd Sess, 1994 USCCAN 514, 534. The language and legislative history of the MMPA thus evince absolutely *no* Congressional intent to abrogate the Tribe's Treaty right to take marine mammals.

It has been argued that the MMPA abrogates Indian treaty rights because it provides an exemption only for Alaska Natives but not other native groups. This argument misses the mark because Alaska Natives have no *treaty* rights to take marine mammals. The enactment of a special provision granting Native Alaskans special hunting rights cannot by negative implication abrogate the rights of other native groups that were already guaranteed such rights by treaty. In

United States v. Bresette, 761 F. Supp. 658, 663 (D. Minn. 1991), it was held that a similar Alaska Native exception in the Migratory Bird Treaty Act (MBTA) did *not* abrogate Indian *treaty* rights.[6]

Under well-established case law, the Tribe's unabrogated rights to take marine mammals are subject to regulation only where "necessary for conservation" of a particular marine mammal stock or species. *Washington v. Washington Passenger Fishing Vessel Assn.*, 443 U.S. 658, 682 (1979) ("treaty fishermen immune from all regulation save that required for conservation"); *Puyallup Tribe v. Department of Game*, 391 U.S. 392, 401 n.14 (1968) (power of the State to impose time and area restrictions on treaty right fishing is "measured by whether regulations are 'necessary' for the conservation of fish"); *Tulee v. Washington*, 315 U.S. 681, 684-85 (1942) (State may regulate the exercise of treaty fishing rights only if regulations are "necessary for the conservation of fish"). Federal courts have applied the conservation necessity principle to both state and federal regulations. *Anderson*, 371 F.3d at 497, n.21; *see also Midwater Trawlers Cooperative v. Dept. of Commerce*, 282 F.3d 710, 718-19 (9th Cir. 2002) (United States must employ conservation necessity principle when setting tribal fishing allocations); *United States v. Williams*, 898 F.2d 727, 730 & n.4 (9th Cir. 1990) ("government [has] the burden of establishing the conservation necessity of state *and federal* wildlife laws against members of tribes with hunting and fishing treaty rights").

The "conservation necessity" principle is not weakened by the "in common with" language in the Treaty. The purpose of that language was to secure access for non-Indians to the Tribe's usual and accustomed grounds, not to provide a basis for restricting the Tribe's hunting and fishing rights. *United States v. Washington*, 384 F. Supp. 312, 357 (W.D. Wash. 1974) (nothing to indicate that Tribe was "told that its existing fishing activities or tribal control over them would in any way be restricted or impaired by the treaty"), *aff'd,* 520 F.2d 676 (9th Cir. 1975), *cert. denied*, 423 U.S. 1086 (1976).

In the Indian treaty rights context, the term "conservation" is defined restrictively to mean "those measures which are reasonable and necessary to the *perpetuation of a particular run or species*." *Id.* at 342 (emphasis added). The *government* has the "burden of proof" in demonstrating a "conservation necessity" exists. *Id.* To carry its burden, the government must show that:

- a "specific statute or regulation is required to prevent demonstrable harm to the actual conservation of fish,"

---

[6] The Bald Eagle Protection Act (BEPA) which was held to abrogate treaty rights in *United States v. Dion*, 476 U.S. 734, 740-43 (1986), is distinguishable from the MMPA. The BEPA contains a sweeping prohibition on the taking of eagles with a narrow exception allowing the Secretary of the Interior to issue permits allowing eagles to be taken "for the religious purposes of Indian tribes." *Dion*, 476 U.S. at 740, citing 16 U.S.C. § 668a. The legislative history of the BEPA clearly showed that Congress was aware of Indian on-reservation hunting of eagles, considered such hunting to be part of the problem calling for the legislation, and "expressly chose to set in place a regime in which the Secretary of the Interior had control over Indian hunting, rather than one in which Indian on-reservation hunting was unrestricted." *Dion*, 476 U.S. at 743. By contrast, the MMPA provides numerous exceptions to the moratorium on taking marine mammals and contains *no* provisions addressing Indian *treaty* harvests.

- "existing tribal regulation or enforcement is inadequate to prevent demonstrable harm to the actual conservation of fish," and,

- "the conservation required cannot be achieved to the full extent necessary . . . by other less restrictive means or methods."

Id. at 415. Since *United States v. Washington,* these standards have been accepted and applied as established law. *See Midwater Trawlers,* 282 F. 3d at 718-19; *Shoshone-Bannock Tribes v. Fish and Game Comm'n*, 42 F.3d 1278, 1283 (9th Cir. 1994); *Williams*, 898 F.2d at 730; *United States v. Oregon*, 718 F.2d 299, 304 (9th Cir. 1983); *United States v. Michigan*, 653 F.2d 277, 279 (6th Cir.), *cert. denied*, 454 U.S. 1124 (1981); *Lac Courte Oreilles Band v. Wisconsin*, 668 F. Supp. 1233, 1236, 1241 (W.D. Wis. 1987); *Mille Lacs Band v. Minnesota*, 952 F. Supp. 1362, 1380 (D. Minn.), *aff'd*, 124 F.3d 905 (8th Cir. 1997), *aff'd*, 526 U.S. 172 (1999).

In sum, the Treaty of Neah Bay has not been abrogated and provides the Makah Tribe with special whaling rights not shared by other United States citizens. NOAA may regulate the exercise of these rights only if it can demonstrate that its regulations are necessary for conservation. To satisfy the "conservation necessity" standard, federal regulations restricting the Tribe's whaling rights may be promulgated only where necessary to preserve a particular species or stock of whales and, taking existing Tribal regulations into consideration, where they are the least restrictive means available to achieve this purpose.

B. Federal Trust Responsibility.

Courts have long recognized that a "special relationship" exists between the United States and Indian tribes which provide the Constitutional basis for legislation, treaties, and Executive Orders that grant unique rights to Indian tribes. *Morton v. Mancari*, 417 U.S. 535, 551-53 (1974). This relationship imposes fiduciary duties upon the government to faithfully carry out treaty and other legal mandates enacted for the benefit of Indian tribes. *Seminole Nation v. United States*, 316 U.S. 286, 296-97 (1942) *Cherokee Nation v. Georgia*, 30 U.S. 1(5 Pet.) (1831); *see also* Chambers, *Judicial Enforcement of the Federal Trust Responsibility*, 27 Stan. L. Rev. 1213 (1975); Cohen, *Handbook of Federal Indian Law* 220-21 (1982 ed.). These fiduciary obligations are especially strict where they involve implementation of treaty provisions:

> In carrying out its treaty obligations with the Indian tribes, the Government is something more than a mere contracting party. Under a humane and self-imposed policy which has found expression in many acts of Congress and numerous decisions of [the Supreme] Court, it has charged itself with moral obligations of the highest responsibility and trust.

Seminole, 316 U.S. at 296-97.

The scope of the Federal trust relationship is broad and applies to all federal agencies. *Pyramid Lake Paiute Tribe v. United States Navy*, 898 F.2d 1410, 1420 (9th Cir. 1990); *Nance v.*

Environmental Protection Agency, 645 F.2d 701, 711 (9th Cir.), *cert. denied*, 454 U.S. 1081 (1981). The United States government has an obligation to protect tribal property, including Indian hunting and fishing rights. *Lincoln v. Vigil*, 508 U.S. 182, 194 (1993) ("The law is 'well established that the Government in its dealings with Indian tribal property acts in a fiduciary capacity.'") (quoting *United States v. Cherokee Nation*, 480 U.S. 700, 707 (1987)); *Pyramid Lake*, 898 F.2d at 1420. Federal agencies have a duty to "represent the Tribe's interests forcefully despite [their] other representative obligations."[7] *White Mountain Apache Tribe v. Hodel*, 784 F.2d 921, 925 (9th Cir.) *cert. denied*, 479 U.S. 1006 (1986).

The requirements of the general trust responsibility are enhanced by the language and negotiating history of the Treaty of Neah Bay. Article IV of the Treaty of Neah Bay "secures" to the Tribe the right of whaling at usual and accustomed grounds and stations. In the treaty negotiations, the Tribe was "invited by the white negotiators to rely and in fact did rely on the good faith of the United States to protect that right." *Fishing Vessel*, 443 U.S. at 667. The government's "promise that the treaties would protect [the Tribe's] source of food and commerce were crucial in obtaining the Indian's assent." *Id.* at 676. In short, NOAA has a special obligation to consider and protect the treaty whaling rights of the Makah Tribe when it considers the Tribe's request for a waiver from the MMPA take moratorium.

C. International Convention on the Regulation of Whaling.

The International Convention on the Regulation of Whaling (ICRW) was signed in 1946 to "provide for the proper conservation of whale stocks and thus make possible the orderly development of the whaling industry." 62 Stat. 1716 (Dec. 2, 1946). The ICRW establishes the IWC, which is composed of one member from each signatory government, whose primary function is to adopt whaling regulations known as the "Schedule." The Schedule and all amendments thereto are deemed to be part of the ICRW itself. Arts. I, III, V. Amendments to the Schedule may not allocate quotas to any group of whalers. Art. V, § 2.

The original Schedule prohibited the harvest of gray whales, "except when the meat and products of such whales are to be used exclusively for local consumption by the aborigines." 62 Stat. at 1723. Since the late 1970s, aboriginal subsistence whaling has been subject to quotas and other regulations adopted by the IWC. Paragraph 13 of the Schedule sets strict guidelines for the setting of aboriginal subsistence whaling quotas. For stocks at or above a maximum sustained yield level (MSYL), aboriginal subsistence catches are permitted so long as total removals do not exceed 90 per cent of maximum sustained yield (MSY). For stocks below the MSYL but above a

---

[7] These trust obligations have been implemented in Secretarial Order No. 3206, issued June 5, 1997 and signed by the Secretaries of Interior and Commerce, which directs NOAA to carry out its responsibilities under the Endangered Species Act in a manner that harmonizes the Federal trust responsibility to tribes, tribal sovereignty, and NOAA's statutory missions, so as to avoid or minimize the potential for conflict and confrontation. Executive Order 13175, dated November 6, 2000, requires agency policy making to be guided by principles of respect for Indian treaty rights and responsibilities that arise from the unique legal relationship between the Federal Government and Indian tribal governments. On issues relating to treaty rights, the Executive Order directs each agency to explore and, where appropriate, use consensual mechanisms for developing regulations.

certain minimum level, aboriginal subsistence catches are permitted so long as they are set at levels which will allow whale stocks to move to the MSYL.[8]

In 2002, the IWC renewed the aboriginal subsistence gray whale quota for the Eastern North Pacific stock and authorized the taking of up to 620 gray whales between 2003 and 2007, with a maximum of 140 in any one year. By bilateral agreement between the United States and the Russian Federation, up to 20 whales may be taken by the Makah Tribe over the five year quota period, with a maximum of five whales in any one year. The IWC Schedule also prohibits the taking of a gray whale calf or a gray whale accompanied by a calf.

The United States has implemented the ICRW through the Whaling Convention Act (WCA). 16 U.S.C. §§ 916 *et seq.* Pursuant to the WCA, NOAA has adopted aboriginal subsistence whaling regulations which are set out at 50 C.F.R. Part 230. The regulations permit whaling captains designated by a Native American whaling organization which has been recognized by NOAA to engage in subsistence whaling in accordance with IWC quotas and regulations. 50 C.F.R. §§ 230.5, 230.6. NOAA has entered into three cooperative agreements with the Tribe (in 1996, 1997, and 2001) recognizing the Makah Tribal Council as a Native American whaling organization and permitting the Council to issue permits to whaling captains consistent with IWC quotas and regulations.

D. MMPA.

1. Policies and Purposes of the Act.

The MMPA was adopted in 1972 out of concern that "certain species and population stocks of marine mammals are, or may be, in danger of extinction or depletion as a result of man's activities." 16 U.S.C. § 1361(1). It is the goal of the MMPA that marine mammal "species and population stocks should not be permitted to diminish beyond the point at which they cease to be a significant functioning element in the ecosystem of which they are a part." *Id.* § 1361(2). Consistent with this major objective, species and population stocks "should not be permitted to diminish below their optimum sustainable population." *Id.* The MMPA defines the term "optimum sustainable population" to mean:

> with respect to any population stock, the number of animals which will result in the maximum productivity of the population or the species, keeping in mind the carrying capacity of the habitat and health of the ecosystem of which they form a constituent element.

---

[8] Paragraph 10(a) of the Schedule defines a "Sustained Management Stock" (SMS) as any "stock which is not more than 10 per cent of Maximum Sustainable Yield (hereinafter referred to as MSY) stock level below MSY stock level, and not more than 20 per cent above that level; MSY being determined on the basis of the number of whales."

16 U.S.C. § 1362(9).

2. Waiver and Permit Requirements.

Section 101(a) of the MMPA imposes a moratorium on the taking of marine mammals, except under regulations and permits adopted by the Secretary of Commerce under the Act. 16 U.S.C. § 1371(a). However, the Secretary may waive the moratorium if he determines, "on the basis of the best scientific information available," in consultation with the Marine Mammal Commission, and "having due regard for the distribution, abundance, breeding habits and times and lines of migratory movements" of the animals in question, that a waiver is "compatible" with the MMPA. *Id.* § 1371(a)(3)(A). To waive the moratorium, the Secretary must also "be assured that the taking of such marine mammals is in accord with sound principles of resource protection and conservation as provided in the purposes and policies" of the Act. *Id.* A waiver of the moratorium requires the promulgation of regulations and in some cases may also require the issuance of permits. *Id.*

The process for adopting regulations authorizing the taking of marine mammals is set out in Section 103 of the MMPA, 16 U.S.C. § 1373. Such regulations must be promulgated "on the basis of the best scientific evidence available" and in consultation with the Marine Mammal Commission. 16 U.S.C. § 1373(a). The regulations must "insure that such taking will not be to the disadvantage of those species and population stocks, and will be consistent with the purposes and policies" of the Act. *Id.* In prescribing such regulations, the Secretary must give full consideration to all relevant factors, including the effect of such regulations on existing and future levels of marine mammal species and population stocks; the government's existing international treaty and agreement obligations; the marine ecosystem and related environmental considerations; the conservation, development and utilization of fishery resources; and the economic and technological feasibility of implementation. *Id.* § 1373(b).

MMPA take regulations may include restrictions on the number of animals which may be taken by permit in any calendar year; the age, size or sex of the animals which may be taken; the season or other time period within which animals may be taken; and the manner and locations in which animals may be taken. 16 U.S.C. § 1373(c). Any such regulations must be made "on the record after opportunity for an agency hearing on both the Secretary's determination to waive the moratorium . . . and on such regulations." *Id.* § 1373(d). In addition to other requirements imposed by law with respect to agency rulemaking, the Secretary must publish and make available to the public before or concurrent with the publication in the Federal Register of his intention to prescribe regulations a statement setting forth:

(1) the estimated existing levels of the species and population stocks of the marine mammal concerned;

(2) the expected impact of the proposed regulations on the optimum sustainable population of such species or population stock;

(3) the evidence before the Secretary upon which he proposes to base such

regulations; and

(4) any studies or recommendations made by or for the Secretary or the Marine Mammal Commission that relate to the establishment of such regulations.

Id. The process for issuing permits is set out in Section 104 of the MMPA, 16 U.S.C. § 1374. Any permit issued under Section 104 of MMPA must be consistent with the regulations promulgated under Section 103 and specify the number and kind of animals which are authorized to be taken, the location and manner in which they may be taken, the period during which the permit is valid, and any other terms and conditions deemed appropriate by the Secretary. *Id.* § 1374(b). To issue a permit, the Secretary must also determine that the proposed manner of taking will be humane.

3. The Potential Biological Removal (PBR) Approach to Achieving Optimum Sustainable Population Levels.

In 1994, Congress amended the MMPA to incorporate the potential biological removal (PBR) approach to measuring effects of marine mammal takes on the optimum sustainable population (OSP) of stocks and populations. The need for the PBR approach was brought on by the decision in *Kokechik Fishermen's Ass'n v. Secretary of Commerce*, 839 F.2d 795 (D.C. Cir. 1988), which held that NOAA could not issue a permit for the incidental taking of one marine mammal species in a commercial fishery where the fishing operation also incidentally took other species and insufficient information existed to determine the population status of those species.

Following *Kokechik*, Congress amended the MMPA to establish a five-year interim exemption from the Act's prohibition on taking marine mammals incidental to most U.S. commercial fishery operations, while directing NOAA to use the five-year period to collect data on marine mammal stocks and the extent of commercial fishery interactions with those stocks, and to develop a proposed regime to govern interactions between commercial fishing operations and marine mammals after the exemption expired.

NOAA issued its proposed regime along with a legislative environmental impact statement in November 1992. As explained by the House Committee which reported out the 1994 Amendments to the MMPA:

> The goal of the proposal – like the goal of the Act – was to have all marine mammal stocks reach their optimum sustainable population [OSP]. NMFS proposed that levels of incidental take quotas be determined based on the concept of "Potential Biological Removal" (PBR): the maximum number of animals, excluding natural mortalities, that may be removed from a population without affecting its ability to reach or maintain OSP.

H.R. Rep. No. 439, 103rd Cong., 2d Sess. (Mar. 21, 1994).

Congress enacted the PBR approach into law in the 1994 Amendments to the MMPA.

Pub. L. 103-238, 108 Stat. 544 (Apr. 30, 1994). The 1994 Amendments incorporate the following definition into Section 3 of the Act:

> The term "potential biological removal level" means the maximum number of animals, not including natural mortalities, that may be removed from a marine mammal stock while allowing that stock to reach or maintain its optimum sustainable population. The potential biological removal level is the product of the following factors:
>
> (A) The minimum population estimate of the stock.
>
> (B) One-half the maximum theoretical or estimated net productivity rate of the stock at a small population size.
>
> (C) A recovery factor of between 0.1 and 1.0.

16 U.S.C. § 1362(20).

The 1994 Amendments also required NOAA to produce stock assessment reports (SARs) for each marine mammal stock which occurs in waters under the jurisdiction of the United States. These SARs must be based on the best scientific information available and describe for each stock, *inter alia*, its geographic range, including any seasonal or temporal variation in its range; an estimate of the stock's minimum population size, its current and maximum net productivity rates and current population trend; an estimate of the annual human-caused mortality and serious injury of the stock by source; and an estimate of the potential biological removal level for the stock, describing the information used to calculate it, including the recovery factor. 16 U.S.C. § 1386(a). SARs must be revised at least once every three years.[9] *Id.* § 1386(c).

In accordance with the 1994 Amendments to the MMPA, NOAA currently evaluates all human-caused mortalities in relation to a stock's PBR level. The PBR approach is NOAA's established management strategy for achieving the primary goal of the MMPA, which is to prevent any marine mammal stock from being reduced below its OSP level.[10]

---

[9] Congress addressed the issue of takings incidental to commercial fisheries by requiring the development of incidental take plans designed to reduce incidental takes of stocks below the PBR level. *See* 16 U.S.C § 1387(f). Subsistence harvests of marine mammals by Alaska Natives were not affected by the PBR calculations. *Id.* § 1386(e).

[10] NOAA's most recent stock assessment for the Eastern North Pacific stock of gray whales is for 2003 (Angliss and Lodge 2004). The stock assessment is available at: http://www.nmfs.noaa.gov/prot_res/readingrm/MMSARS/sar2003akfinal.pdf

IV. Life History and Population Status of the Eastern North Pacific Stock of Gray Whales.

A. General Life History and Distribution.

Gray whales (*Eschrictius robustus*) are baleen whales classified in the suborder Mysticeti and are the only species in the monotypic family Eschrichtiidae. The generic name, *Eschrichtius*, was given in recognition of Daniel Eschrict, a 19th century zoologist, and the specific name *robustus* is Latin for "oaken" or "strong." Gray whale nomenclature is further reviewed in Rice and Wolman (1971) and the fossil record and evolution of gray whales is described in Barnes and McLeod (1984).

Gray whales historically existed in both the Pacific and Atlantic Oceans. The Atlantic population was extirpated by the end of the 17th Century (Mead and Mitchell 1984). Gray whales in the Pacific Ocean are divided into two distinct stocks: the Eastern North Pacific gray whale stock (sometimes referred to as the Chukchi-California stock), which is fully recovered from exploitation by commercial whaling and migrates from the Bering and Chukchi Seas to Baja Mexico (Swartz 1986); and the critically depleted Western North Pacific stock (also referred to as the "Korean-Okhotsk" stock) which migrates along the east coast of Asia (Rice and Wolman 1971).

Gray whales are easily distinguished from other whales. Gray whales are gray in coloration and have patches of lice and barnacles, giving them a mottled appearance. They lack a dorsal fin. However, they have a dorsal hump which is followed by a series of knobs or "knuckles" which are distinctly visible as they arch. Adult gray whales are between 11 and 15 m in length, with females being larger than males.

B. Migration.

The Eastern North Pacific stock of gray whales feeds in the summer in the northern Bering and Chukchi Seas and winters off of Baja California, Mexico (Scammon 1874). Wintering gray whales are found within the lagoons and protected waters of the western Baja Peninsula and, to some extent, along the Mexican mainland and in the Gulf of California (Swartz et al. 2000). The northbound migration begins with newly pregnant females, adult males, anestrous females and immature whales of both sexes which leave the wintering grounds around mid- to late-February (Poole 1984) and begin to arrive in the Bering Sea from late-March through May (Braham 1984). Females with calves are the last to leave southern waters and depart between late-March and May (Swartz et al. 2000). Females with calves travel more slowly than whales without calves to accommodate nursing as well as the slower swimming speed of the calves (NMFS 2001). Cow-calf pairs enter the Bering Sea from May through June (Braham 1984).

The southbound migration also occurs in phases. Gray whales are moving out of the Bering Sea by late-November, beginning with near-term pregnant females and followed by oestrus females, mature males, and then juveniles of both sexes (Swartz et al. 2000). Gray whales

begin to arrive in the waters off Baja in late-December and reach highest densities by mid-February (Jones and Swartz 1984). The gray whale migration is approximately 10,000 km each way (Scammon 1874).

The timing of migration at certain points along the Pacific coast is more thoroughly presented in Pike (1962), Swartz (1986), Rugh et al. (1999), and Swartz et al. (2000). According to this data, southbound whales are present along the Washington coast beginning in early December, peaking around 5 January, and ending in the first week of February. Northbound whales are present from late-February into June (NMFS 2001).

On both the northbound and southbound migration, gray whales tend to follow the shoreline, although they also traverse larger expanses of open water. In Washington, northbound migrants averaged 11.9 km from shore (Green et al. 1995), while southbound migrants have been seen up to 47 km from shore (Shelden et al. 1999), with an average distance of 25.2 km from shore (Green et al. 1995). A hypothesis explaining why gray whales are farther offshore during the southbound migration in Washington is that gray whales may take a more direct route from central Vancouver Island to the mouth of the Columbia River, instead of taking the longer route following the coast line (Green et al. 1995). Also, gray whales may feed during the northward migration and therefore travel closer to the coast, while during the southbound migration they already have a positive energy balance when they depart from the Arctic feeding grounds.

C. Reproduction.

Both male and female gray whales become sexually mature between 5 and 11 years of age, with an average of 8 years (Rice and Wolman 1971). Mature females breed in two year cycles, producing a calf every other year (Swartz 1986). Breeding occurs during the southward migration, with a mean conception date of 5 December (Rice and Wolman 1971). Females that have not successfully bred may enter a second estrus phase approximately 40 days later (Rice and Wolman 1971). Gestation lasts 418 days (Rice 1983) with a median birth date of 27 January (Rice et al. 1981). Calves are approximately 4.57 m long at birth (Rice 1983). The sex ratio of calves is 1:1 (Jones and Swartz 1984; Rice and Wolman 1971). Gray whale calves wean in August (Rice and Wolman 1971).

D. Feeding Behavior and Prey.

Gray whales employ a variety of foraging methods including benthic suction, engulfing, and skimming and feed on a wide variety of prey (Nerini 1984). Nerini (1984) reviewed reports on gray whale stomach analyses and listed the presence of over 90 genera. Gray whales primarily feed on benthic invertebrates. In the Arctic, the most common prey item is benthic tube-dwelling amphipods which can be found at densities as high as 23,780 individuals per square meter (Nerini 1984). The benthic foraging behavior is disruptive to the benthos (Oliver and Slattery 1985) and may be considered a specialized type of niche construction (Odling-Smee et al. 1996). The gray whales' ability to use different foraging methods and their ability to prey upon a variety of species may account for their more rapid recovery from commercial whaling in comparison with other great whale species (Nerini 1984; Moore et al. 2001).

Gray whales do not feed significantly during their southbound migration (Perryman and Lynn 2002). Oliver et al. (1983) did not find compelling evidence of benthic feeding in the winter grounds. There are reports of mud plumes observed on the calving grounds (e.g., Norris et al. 1977), but for the most part, it appears that gray whales fast during the winter (Perryman and Lynn 2002) and can lose 11-29% of their weight between the south- and northbound migrations (Rice and Wolman 1971).

E. Natural and Human-Related Mortality.

Natural mortality of gray whales includes predation by killer whales (*Orcinus orca*) (Baldridge 1972; Goley and Straley 1994), disease, entrapment in ice (IWC 2003), starvation, and old age. NOAA Fisheries maintains a stranding database of marine mammals. The average number of gray whales reported as stranded between 1995 and 1998 was 38 per year (Angliss and Lodge 2004). In 1999 and 2000, the stranding rate increased to 273 and 355, respectively (Angliss and Lodge 2004). The actual cause of death for these stranded whales is largely unknown (IWC 2003). Since 2000, the stranding rate has returned to pre-1999 levels (Angliss and Lodge 2004).

Eastern North Pacific gray whales have been traditionally hunted by Eskimos and Chukotka Natives in the Arctic, and by several Tribes from the Aleutians to California (O'Leary 1984). Shore-based commercial whaling occurred in California and Baja California from about the mid-1800's to 1900 (Henderson 1984; Sayers 1984). Modern whaling from ocean-going vessels occurred from 1914 to 1946 and was pursued by the United States, Japan, Norway, and the Soviet Union (Reeves 1984). Gray whales were afforded some protection from commercial harvest by nations that were signatory to the 1937 International Agreement for the Regulation of Whaling and received more complete protection under the 1946 International Convention for the Regulation of Whaling (ICRW) (Reeves 1984). The ICRW banned all commercial harvest of gray whales while continuing to allow for aboriginal subsistence use. From 1959 until 1969, 316 gray whales were taken under scientific research permits issued by the United States Bureau of Commercial Fisheries (now called NOAA Fisheries) (Rice and Wolman 1971; Perryman and Lynn 2002).

Data on aboriginal subsistence gray whale harvest is available on the IWC website (http://www.iwcoffice.org/_documents/table_aboriginal.htm). The Soviet Union operated a large whale catcher ship on behalf of Chukotka Natives between 1967 and 1991, harvesting gray whales at an average rate of 165 gray whales per year from 1985 through 1991. After the collapse of the Soviet Union, aborigines in Chukotka resumed hunting using traditional methods from their own small craft, and averaged an annual harvest of 96 gray whales from 1994 through 2002. Aboriginal hunters in Alaska harvested one gray whale in 1985, two in 1986, one each in years 1988 and 1989, and two in 1995. The Makah Tribe harvested one gray whale in the spring of 1999. As indicated in Section III.C, in 2002, the IWC renewed the gray whale quota for the Eastern North Pacific stock and authorized the taking of up to 620 gray whales between 2003 and 2007, with a maximum of 140 in any one year. By bilateral agreement between the United States

and the Russian Federation, up to 20 whales may be taken by the Makah Tribe over the five year quota period, with a maximum of five whales in any one year (IWC 2002).

Aside from aboriginal harvest, other sources of human-related mortality and serious injury of gray whales include ship strikes (average of 1.2 gray whales per year) and incidental catch in commercial fisheries (average of 8.9 gray whales per year) (Angliss and Lodge 2004).

F. Abundance.

The Eastern North Pacific gray whale stock is considered to be one of the best studied cetacean populations in the world (Swartz 1986) largely because of the stock's close proximity to shore throughout its range. Because the stock migrates close to shore and has a predictable migration window, it is feasible to conduct shore-based sighting surveys to estimate abundance. Gray whales have been surveyed during their southbound migration at or near Granite Canyon, California since 1967 (Buckland and Breiwick 2002; Angliss and Lodge 2004). The raw count data is then transformed into an abundance estimate after accounting for the following factors: a correction for missed whales; a correction for whales passing during periods when no observers are present; differential sightability by observers, pod size, distance offshore, and environmental conditions; errors in pod size estimation; covariance within the corrections due to variable sightability by pod size; and a correction for a difference between diurnal and nocturnal travel rates (Hobbs and Rugh 1999; Rugh et al. 2003).

The population estimate used in the most recent NOAA Stock Assessment Report (Angliss and Lodge 2004) for Eastern North Pacific gray whales is 26,635 (CV = 10.06%; 95% log normal confidence interval = 21,878 to 32,427), which was based on the 1997/98 southbound migrant observation season (Hobbs and Rugh 1999). The population had an intrinsic growth rate of 2.5% (SE = 0.3%) from 1967/68 to 1995/96 (Buckland and Breiwick 2002), despite the annual removal of up to 165 whales by, or on behalf of, Russian natives. Similar abundance surveys were also conducted in the 2000/2001 and 2001/2002 seasons which resulted in abundance estimates of 18,761 (CV = 10%; 95% log-normal confidence interval = 15,249 to 22,812) and 17,414 (CV = 10.06%; 95% log-normal confidence interval = 14,322 to 21,174), respectively (Rugh et al. 2002). Rugh et al. (2003) recalculated the three most recent abundance estimates due to a new computer program for matching sightings and the use of an alternative observation station in 1998 (due to a storm washing out an access road to the usual observation station). The revised estimates are: 27,958 in 1997/98 (CV = 10.21%; 95% log-normal confidence interval = 22,901 to 34,131), 18,246 in 2000/01 (CV = 9.36%; 95% log-normal confidence interval = 15,195 to 21,910), and 16,848 in 2001/02 (CV = 9.49%; 95% log-normal confidence interval = 13,995 to 20,283). The corrected 2001/02 estimate reported in Rugh et al. (2003) is the most reliable and current abundance estimate for this stock, and will be used in the remainder of this document rather than the 1997/98 abundance estimate reported in the most recent NOAA Stock Assessment Report (Angliss and Lodge 2004).

Trends in gray whale calf production have been monitored using three methods: surveying for calves from shore and from aircraft in central California during the northbound migration (Perryman et al. 2002; Perryman et al. 2004); counting calves from shore at Granite

Canyon, California, during the southbound migration (Shelden and Rugh 2001); and conducting aerial and vessel surveys for calves in the breeding lagoons of Baja California (Urban et al. 2003). Calf production is used in modeling population dynamics of gray whales (Wade and Perryman 2002). Gray whale calf production has also been correlated with the distribution of seasonal ice in the Arctic (Perryman et al. 2002).

Wade and Perryman (2002) calculated the carrying capacity (K) for this stock to be approximately 22,000 gray whales. Therefore, the population likely surpassed its carrying capacity in the late 1990's when it reached an estimated abundance of almost 28,000 whales (Rugh et al. 2003). The increased stranding rate observed in 1999 and 2000 (Le Boeuf et al. 2000; Angliss and Lodge 2004), as well as the low calf production observed over this time period (Le Boeuf et al. 2000; Perryman et al. 2002) were probably symptoms of the fact that the Eastern North Pacific stock of gray whales had exceeded its carrying capacity. The stranding rate has returned to normal levels (Angliss and Lodge 2004) as has calf production. The 2004 calf production estimate was greater than any other recorded (Perryman et al. 2004). As noted by Perryman et al. (2004), the ENP population might actually be higher than the most recent abundance estimates because some animals may not have migrated as far south as Granite Canyon in 2000/01 or 2001/02 (Rugh et al. 2003).

G. Pacific Coast Feeding Aggregation.

Most gray whales from the Eastern North Pacific stock migrate north of the Aleutian chain to feed during the summer and fall. However, some gray whales do not make a full migration and have been observed from Kodiak, Alaska to California during non-migratory periods (Calambokidis et al. 2003). Whales in this group arrive and depart from their wintering grounds concurrently with the overall population that migrates to the Arctic (Calambokidis et al. 2002a). Pike (1962) referred to this group as "summer residents." Because the term "summer resident" is a misnomer, NMFS (2001) referred to this group as the Pacific Coast Feeding Aggregation (PCFA). For the purposes of this request, the "PCFA" is defined as any whale found in the photo-identification database maintained by NOAA's National Marine Mammal Laboratory (NMML) which has been observed south of Alaska from June 1 through November 30 in any year.

Photo-identification studies of gray whales in the PCFA have been undertaken since 1970 (Hatler and Darling 1974) using unique markings on the sides of the gray whale which are revealed as the whales arch (Darling 1984). Darling (1984) hypothesized that gray whales seen along the coast of British Columbia were apart of a larger 'northwest coast' group that numbered at least 100 animals. Calambokidis et al. (2002a) reported that there were approximately 180 gray whales in the PCFA based on a mark-recapture abundance estimate for 1998. Calambokidis et al. (2002b), using a similar approach, reported an abundance estimate for the PCFA of 322 gray whales for 2001; and reported approximately 270 gray whales for 2002 (Calambokidis et al. 2003) (both papers only use whales seen after June 1 because whales that are seen prior to that date are typically never seen again). Calambokidis et al. (2004) used a dataset from 1998-2003 from California to Northern Vancouver Island and whales observed after June 1 and used an open population model approach to derive an abundance estimate of 200 gray whales (CV = 10.3%) for

2003, with a 2003 estimate of 176 whales (CV = 11.6%) based strictly on whales that were seen in multiple years.

In addition to the utility of photo-identification for mark-recapture population analyses and abundance estimates, the ability to identify individual gray whales through photo-identification also provides an opportunity to assess movement, tenure, and site fidelity to the Pacific coast south of Alaska. Those gray whales from the PCFA that have longer interannual sighting histories also tend to be seen in multiple survey regions throughout the PCFA (Calambokidis et al. 2004). As an example of the wide-ranging movements made by PCFA whales, a single whale observed in Kodiak, Alaska in 2002 had previously been seen along the west coast of Vancouver Island in 1999, as early as 1995 in the Cape Caution, BC area, and as early as 1992 in the Clayoquot Sound, BC survey area (Calambokidis et al. 2003). Another whale observed off southern Vancouver Island on 6 July 2003 was later seen in Kodiak on 9 August 2003; corresponding to a direct route movement of 1,104 nautical miles in 34 days (Calambokidis et al. 2004)

Calambokidis et al. (2004) reported that the length of time a whale was observed within a season proved to be a valuable tool in understanding the overall dynamics of the PCFA. A minimum residency tenure (MRT), defined as the time between first and last dates photographed within a year, was calculated to examine the likelihood that a particular whale would be seen the following year. Sixty-eight percent of the whales with a MRT of one week or less were seen during July-September, well outside the migration time period. Whales with longer MRTs in their first year observed were more likely to return in subsequent years. The authors suggested that the mechanism for whales with longer MRTs, and thus higher probability of returning the following year, is likely related to the foraging success that they encounter during the previous year.

Calambokidis et al. (2004) noted that while it makes logical sense when comparing interchange rates of gray whales between survey regions south of the Aleutian Island chain that immediately adjacent survey areas show stronger interchange rates in comparison with interchange rates between survey areas further to the north or south of the site, these results also suggest that individual gray whales regularly return to particular feeding areas. Gray whales in the PCFA were most likely to be re-sighted in adjacent survey area, thus indicating fidelity to an area that is smaller than the PCFA region as a whole, but larger than a single survey region (Calambokidis et al. 2004). The area to the north of the Makah U&A (i.e., the Southern Vancouver Island survey area) as well as the survey area to the south of the Makah U&A (i.e., the Oregon survey area) exhibit the highest degree of interchange. Thus, the authors recommended combining these regions as the appropriate geographic range for assessing local impacts and establishing subquotas for the PCFA (Calambokidis et al. 2004). The three survey regions of Oregon, Northern Washington and the Strait of Juan de Fuca (Makah U&A), and Southern Vancouver Island make up the combined survey area are referred to in this document as the ORSVI survey area.

No genetic differences have been detected between the PCFA and the overall migratory population (Steeves et al. 2001). Steeves et al. (2001) reported that there was a male bias in the

PCFA of 1.7 to 1 (males to females; n = 16), although given the small sample size the bias was not considered to be statistically significant. Ramakrishnan et al. (2001) reported a statistically significant male bias in the PCFA of 1.8 to 1 (males to females; n = 45). The potential explanations of the observed sex bias is that either females are feeding elsewhere in the PCFA and are not being sampled by researchers or that the PCFA is not a separate, closed population (i.e., a population that is experiencing only internal recruitment) (Ramakrishnan et al. 2001). Lang et al. (2004) proposed that the reason for the high genetic diversity observed in samples collected during the summer from Western North Pacific gray whales was the dispersal of males from the Eastern North Pacific gray whale stock into Western North Pacific gray whale feeding grounds. Using both simulations and empirical evidence, Ramakrishnan et al. (2001) reject the hypothesis that the PCFA is a maternal genetic isolate and that both the number of haplotypes and the diversity of haplotypes found in the PCFA is greater than other baleen whale populations of similar size. The level of haplotypic diversity in the PCFA (0.93; Ramakrishnan et al. 2001) is comparable to the haplotypic diversity seen in the Eastern North Pacific stock of gray whales (0.95 ± 0.02; LeDuc et al. 2002).

Given the best available information, NOAA has managed the PCFA as part of the Eastern North Pacific stock of gray whales (Swartz et al. 2000; Angliss and Lodge 2004). The IWC recognizes the existence of a feeding aggregation of gray whales along the Pacific Coast south of Alaska, but likewise continues to manage the Eastern North Pacific stock of gray whales as a single stock (IWC 2000). However, to avoid local depletion of a feeding aggregation in which individuals show site fidelity to the region and thereby address the MMPA policy that gray whales remain a "significant functioning element of the ecosystem," 16 U.S.C. § 1361(2), the Tribe's waiver request contains management measures, including time and area restrictions and annual bycatch level (ABL) subquotas, designed to minimize impacts to those whales that exhibit inter-annual site fidelity to the Pacific coast south of Alaska.

V. Expected Impact Of The Requested Waiver.

A. Effects on the Eastern North Pacific Stock of Gray Whales.

One of the primary goals of the MMPA is to maintain marine mammal populations at or above an optimum sustainable population (OSP). 16 U.S.C. § 1361(2) and (6). OSP is defined as "with respect to any population stock, the number of animals which will result in the maximum productivity of the population or the species, keeping in mind the carrying capacity of the habitat and the health of the ecosystem of which they form a constituent element." 16 U.S.C. § 1362(9). NOAA has quantified OSP as a population size which ranges between a stock's maximum net productivity level (MNPL) and its carrying capacity (K). *See* 50 C.F.R. § 216.3.

Wade and Perryman (2002) completed an assessment of the Eastern North Pacific gray whale population that incorporated the time series from 1967/68 to 2001/02. They used four different scenarios using the abundance estimates as well as: (1) using all the calf estimates, (2) using none of the calf estimates, (3) using all of the calf estimates except the 1980 and 1981 estimates, and (4) using all of the calf estimates plus an assumed value in 2002 (which was not available at the time of the analysis), to estimate the carrying capacity to be 22,610 (90% CI = 19,830 to 28,470), 21,740 (90% CI = 19,480 to 35,430), 22,110 (90% CI = 19,840 to 26,880), and 22,590 (90% CI = 20,020 to 30,280), respectively for each scenario. For the purposes of the Tribe's waiver request, K will be expressed as a range between 21,740 and 22,610 animals (the lowest and highest values reported among the four scenarios).

Historically, MNPL has been expressed as a range of values (generally 50 to 70 percent of K) determined theoretically by estimating the stock size in relation to the pre-exploitation stock size, which would produce the maximum net increase in population. 42 Fed. Reg, 12,010 (Mar. 1, 1977). In 1977, the mid-point of this range, 60 percent of K, was used to determine whether dolphin stocks in the eastern tropical Pacific Ocean were depleted. 42 Fed. Reg. 64,548 (Dec. 27, 1977). In 1980, NOAA used the 60 percent value in the final rule to govern the taking of marine mammals as bycatch to commercial fishing operations. 45 Fed. Reg. 72,178 (Oct. 31, 1980). More recently, in its 2000 final rule to designate the Cook Inlet stock of beluga whales (*Delphinapterus leucas*) as depleted under the MMPA, NOAA used 60 percent of K as the value to calculate MNPL. 65 Fed. Reg. 34590 (May 31, 2000).

Using the upper and lower range of the values for carrying capacity in Wade and Perryman (2002) and assuming that MNPL = 0.6*K, the MNPL for the Eastern North Pacific stock of gray whales is between 13,044 and 13,566. Hence the OSP for the Eastern North Pacific Stock is a range between 13,044 and 22,610 animals. The most recent abundance estimate (i.e., from the 2001/02 southbound migration season) for the Eastern North Pacific stock of gray whales is 16,848 (CV = 9.49%; 95% log-normal confidence interval = 13,995 to 20,283) (Rugh et al. 2003). Therefore, the Eastern North Pacific gray whale stock is currently above MNPL and is within OSP. Using the abundance estimates reported in Wade and Perryman (2002) and Rugh et al. (2003), the Eastern North Pacific stock of gray whales has been consistently at or above MNPL since the 1979/80 abundance estimate, and it is important to note that during this time

period this stock has undergone sustained harvest by, or on behalf of, aboriginal groups. During the late 1990s, the stock probably exceeded the high end of the OSP range.

The IWC has likewise concluded that the ENP stock of gray whales remains a Sustained Management Stock. As indicated in Section III.C. above, the IWC manages whale stocks in relation to their maximum sustained yield level (MSYL), a concept which is analagous to the MMPA concept of MNPL (the difference being that MSYL considers the age and sex structure of the harvest). In 2002, the IWC Scientific Committee conducted a comprehensive assessment of gray whale stocks and concluded that there was essentially zero probability that the Eastern North Pacific stock was below its MSYL (Wade and Perryman 2002; IWC 2003).

As explained in greater detail in Section III.D.3 above, the 1994 amendments to the MMPA adopted the potential biological removal (PBR) approach for evaluating human-caused mortality to marine mammal stocks. The PBR is defined in the Act as "the maximum number of animals, not including natural mortalities, that may be removed from a marine mammal stock while allowing that stock to reach or maintain its optimum sustainable population" 16 U.S.C. § 1362(20). The advantage of managing marine mammals using the PBR approach is that it provides a mechanism for achieving the MMPA goal of managing stocks to reach an OSP level where multi-year population trend data is not available (Wade 1998). A total level of human-caused mortality that is less than the PBR is considered sustainable and consistent with the MMPA's goal of managing marine mammal stocks to achieve their OSP level.

Under 16 U.S.C. § 1362(2), the PBR for a particular marine mammals stock is calculated by taking the product of the following factors: the minimum population of the stock (N_{min}); one-half the maximum theoretical or estimated net productivity rate of the stock at a small population size (R_{max}); and a recovery factor (F_r) between 0.1 and 1.0. This relationship is expressed in Equation 1 below:

$$PBR = N_{min} * 0.5R_{max} * F_r \qquad (1)$$

The "minimum population estimate" refers to an "estimate of the number of animals in a stock that: (A) is based on the best available scientific information on abundance, incorporating the precision and variability associated with such information; and (B) provides reasonable assurance that the stock size is equal to or greater than the estimate" 16 U.S.C. § 1362(27). Wade and Angliss (1997) use the following equation (Equation 2) to calculate N_{min} from an abundance estimate:

$$N_{min} = N/\exp(0.842*[\ln(1+CV(N)^2)]^{1/2}) \qquad (2)$$

Wade and Angliss (1997) also provide recommendations on choosing the recovery factor, ranging from 0.1 to 1.0, to be used in different scenarios. A recovery factor of 0.1 is to be used as the default recovery factor when a stock is listed as an endangered species under the Endangered Species Act (ESA). A recovery factor of 0.5 should be used for stocks of an unknown status or for stocks that are listed as threatened under the ESA (or as depleted under the MMPA). A

recovery factor greater than 0.5, up to and including a value of 1.0, should be used: (1) when the stock is known to be within OSP; (2) the stock has an unknown status, but is increasing; or (3) when a stock is not listed under the ESA and is undergoing removals by aboriginal hunters.

Using the most recent available and corrected abundance estimate for the Eastern North Pacific stock of gray whales from the 2001/02 southbound migration season of 16,848 (CV = 9.49%; 95% log-normal confidence interval = 13,995 to 20,283) (Rugh et al. 2003), and inserting it into Equation 2, the N_{min} is calculated to be 15,557. While 0.04 is the default R_{max} value for cetaceans when there is inadequate information on life history parameters (Wade and Angliss 1997), NOAA's 2003 Stock Assessment Report for gray whales uses an R_{max} value of 0.047 for the Eastern Northern Pacific stock based on the extensive literature published on the stock's population dynamics (Angliss and Lodge 2004). This literature indicates that there is a 90% probability that the true value of R_{max} is greater than 0.047, a value based on the lower 10^{th} percentile of an estimate derived from an age- and sex-structured model (Wade 2002). The proper recovery factor to be used for this stock is 1.0, since the Eastern North Pacific stock of gray whales is not listed under the ESA and has been undergoing a steady or declining level of removals by aboriginal hunters (Wade and Angliss 1997; NMFS 2001; Angliss and Lodge 2004). Inserting the values for N_{min} of 15,557, the R_{max} of 0.047, and the F_r of 1.0 into Equation 1, the PBR for the Eastern North Pacific stock of gray whales is 366. This value is less than, but more current and accurate than, the PBR value of 575 whales reported in NOAA's 2003 Stock Assessment (Angliss and Lodge 2004) which was based on the uncorrected and outdated 1997/98 abundance estimate.

Angliss and Lodge (2004) estimate the annual average human-related mortality and serious injury of Eastern North Pacific gray whales is 107 animals. This annual average accounts for aboriginal harvest (97 gray whales; data from years 1996-2000), incidental bycatch in commercial fisheries (9 gray whales; data from 1990-2000), and ship strikes (1 gray whale; data from 1996-2000). This estimate of human-caused mortality is less than one-third of the calculated PBR for this stock (366 gray whales). Substituting the annual average Russian allocation of the IWC gray whale quota -- an average of 120 whales per year -- for the value of 97 (based on the conservative assumption that the average quota will be harvested each year), the estimated annual average human-related mortality and serious injury would increase to 130 gray whales (120 from aboriginal harvest; 9 from bycatch; 1 from ship strike). This hypothetical estimate of human-caused mortality is roughly one-third of the calculated PBR for this stock (366 whales).

Any additional human-caused mortality resulting from the Tribe's waiver request will be insignificant in relation to the PBR level for the Eastern North Pacific stock. The Tribe's waiver request includes a ceiling of seven strikes per year and 35 strikes over any five year period. Based on the worst case scenario that each whale that is struck but not landed will die (i.e., 0% chance of survival of struck and lost whales), the greatest estimated annual average human-related mortality would increase from 130 to 137 (127 mortalities resulting from harvest; 9 from bycatch; 1 from ship strike), which still provides a buffer of 229 gray whales between the total level of human-caused mortality and the PBR of 366 whales.

It is also important to note that the Scientific Committee of the IWC provided management advice in 2002 that a take of up to 463 whales per year (the lower of the 5th percentiles of Q_1) is sustainable for at least the medium term (~30 years) (IWC 2003). This level of take is over 350 percent higher than the average annual joint US-Russian quota of 124 whales per year as well as a conservative estimate of all human-caused mortality in a given year.

B. Effects on the Pacific Coast Feeding Aggregation.

For the purposes of this request, the PCFA is defined as any Eastern North Pacific gray whale found in the photo-identification database maintained by NOAA's National Marine Mammal Laboratory (NMML) which has been observed south of Alaska from June 1 through November 30 in any year. Although the PCFA is not a separate stock under the MMPA, the Tribe's waiver request is designed to prevent any depletion of whales that exhibit inter-annual site fidelity to the ORSVI gray whale management area and thereby assure that gray whales remain a "significant functioning element" of the local ecosystem. See 16 U.S.C. § 1361(2). The Tribe's waiver request would accomplish this goal by restricting the hunting season to the migration period (December 1 through May 31) and by prohibiting any hunting in the Strait of Juan de Fuca where gray whales are known to feed. Because no hunting of gray whales will be permitted between June 1 and November 30, and the hunt will not occur in the inside waters of the Strait of Juan de Fuca, those whales exhibiting inter-annual site fidelity to the Pacific coast south of Alaska will not be subject to any intentional harvest under the Tribe's request.

By themselves, these time and area restrictions should reduce impacts to levels that will eliminate any significant risk of local depletion. While gray whales that are from the PCFA may be present at certain times between December 1 through May 31 within the Pacific Ocean area of the Makah U&A and therefore might be subject to incidental harvest under the Tribe's waiver request, the proportion of PCFA whales that will be potentially subject to harvest will be significantly diluted by the much larger migrating population. Assuming that whales from the PCFA are randomly intermixed with the overall stock during the entire migration period and throughout the migration corridor, by dividing the most current abundance estimate of the PCFA of 200 whales (for year 2003; Calambokidis et al. 2004) by the most current abundance estimate for the stock of 16,848 (for season 2001/02; Rugh et al. 2003), there is only a 1.19% chance that any gray whale taken in a Makah whale hunt will be part of the PCFA.

Previous survey data suggests that whales from the PCFA are not randomly intermixed with the overall ENP stock during the latter part of spring migration, and that during the month of May as many as 13 percent of gray whales seen off the north Washington coast may be part of the PFCA (Calambokidis et al. 2000). Assuming a "worst case" scenario, if the Tribe strikes seven whales each year and every one of these whales is struck during the month of May, as many as five whales from the PCFA could be killed over a five-year period.

Accordingly, to provide an added margin of safety, the Tribe will take the following steps to ensure that the incidental take of whales from the PFCA will not reduce the number of whales that exhibit site fidelity to the Pacific coast south of Alaska:

First, as soon as practicable after a successful hunt and in consultation with NMML scientists, the Tribe will photograph the left and right flanks of all harvested whales and compare these photos with the NMML photographic catalog to determine if a harvested whale was part of the PCFA. Calambokidis et al. (1994) provide an example of a stranded gray whale successfully matched to a photographic catalog composed of live individuals. The NMML catalog includes all gray whales that have been photographed in surveys conducted south of Alaska from June 1 through November 30 of any year.

Second, the Tribe will cease hunting in a calendar year if, based on this photographic analysis, suspension of the hunt is necessary to prevent the number of whales harvested from the PCFA catalog from exceeding an annual allowable bycatch level (ABL) for that year. The ABL for the PCFA will be calculated by applying the MMPA's potential biological removal (PBR) methodology to a conservative estimate of the number of gray whales seen in more than one year in the Oregon-Southern Vancouver Island (ORSVI) gray whale survey area and is mathematically defined in Equation 3 below:

$$ABL = N_{min}(ORSVI) * 0.5R_{max} * F_r \quad (3)$$

These additional measures are highly conservative because the incidental harvest of gray whales from the PCFA photographic catalog, which now includes 477 individual whales observed south of Alaska from June 1 through November 30 from 1998-2003 (Calambokidis et al. 2004), is limited by an ABL derived from a much smaller subset of whales – those whales seen in more than one year within the ORSVI gray whale survey area. In addition, application of an ABL on an annual basis provides a further check against local impacts, because the PBR methodology normally permits averaging of human-caused mortality over a three-year time period (Wade and Angliss 1997).

Calambokidis et al. (2004) used an open population model to incorporate several years of photo-identification work from the PCFA to estimate abundance from California to northern Vancouver Island (200 gray whales; CV = 0.103). The authors further divided the overall PCFA abundance estimate to only consider whales that have been seen in previous years to estimate the abundance of whales that may exhibit inter-annual site fidelity to the overall feeding range of the PCFA (176 gray whales; CV = 0.116). The authors also analyzed the abundance of whales that may exhibit inter-annual site fidelity to the ORSVI gray whale management area (150 gray whales; CV = 0.137). This smaller management area was selected based on similar interchange rates between the survey regions and it includes and incorporates all of the Makah U&A. The authors then provide an abundance estimate that only considers whales seen in multiple years within the ORSVI region (122 gray whales; CV = 0.168). As stated in Calambokidis et al. (2004) "…it is both logical and reasonable to use ORSVI as the region for abundance estimation in setting quotas for a harvest of whales from the [Makah U&A] region."

NMFS (2001) used a closed population model, a recovery factor of 0.5 and 1.0, and two abundance estimates (one included observations in California, and the other did not) for the PCFA to calculate a range of PBR estimates for the entire PCFA which ranged from 2.5 to 6.0 animals

per year. The reason cited in NMFS (2001) for using a reduced recovery factor when it calculated the lower range for its PBR estimate for the PCFA was to take a conservative approach of treating the feeding aggregation as a separate management unit. Since that time, there have been new research studies released including an open population analysis using survey data collected from multiple years by Calambokidis et al. (2004) and a more recent genetic analysis (Ramakrishnan et al. 2001). Because the PCFA is part of the same ENP stock, the recovery factor should be the same as for the overall ENP stock. Unlike the proposal reviewed in NMFS (2001), the Tribe's current request takes a more conservative approach regarding impacts to the PCFA. The Tribe will not be conducting hunts from June 1 through November 30, thereby eliminating intentional harvest of whales from the PCFA, and the Tribe proposes using an abundance estimate, converted to an N_{min}, based on the number of returning whales to the ORSVI survey area to calculate an ABL to account for incidental harvest of PCFA whales during the migration period.

The applicable annual ABL will be calculated as follows. We use the 2003 abundance estimate that only considers whales seen in more than one year in the area from Oregon to southern Vancouver Island (122), the most conservative abundance estimate provided in Calambokidis et al. (2004), to calculate an N_{min} of 106 (using Equation 2). An R_{max} of 0.047 is used because the best available science shows that the PCFA is part of the Eastern North Pacific stock of gray whales (Swartz et al. 2000; Angliss and Lodge 2004). A recovery factor of 1.0 is used because: (1) the best available science shows that the PCFA is part of the Eastern North Pacific stock of gray whales (Swartz et al. 2000; Angliss and Lodge 2004), a recovered non-listed stock for which Angliss and Lodge (2004) use a recovery factor of 1.0; (2) the abundance estimates are calculated from an open population model which incorporate multiple years of survey effort; (3) the PCFA area south of Alaska for which the abundance estimate is based has been truncated to address local depletion around the Makah U&A (i.e., ORSVI); and (4) the abundance estimate is based only on whales seen in multiple years (i.e., whales potentially showing site fidelity to the region). Using Equation 3 and inserting an N_{min} of 106, an R_{max} of 0.047, and an F_r of 1.0, the resulting applicable annual ABL is calculated to be 2.49.

Under the Tribe's waiver request, the applicable ABL would be recalculated using the above methodology to reflect the most current survey data. The proposed calculation methodology is highly conservative. For comparison, if one used the 2003 abundance estimate for all of the whales seen in the PCFA (200 whales), which would be converted to an N_{min} of 184 whales (using Equation 2), the ABL would be 4.32 (using Equation 3). Nevertheless, the Tribe proposes to apply the ABL for the smaller ORSVI gray whale survey area and any harvested gray whale will be compared with the NMML photographic catalog for the entire PCFA, not just those whales seen in ORSVI.

In short, given the remote chances of harvesting a single PCFA whale (much less the chance of harvesting two) in the Pacific Ocean during the migration time period and the Tribe's commitment to cease hunting for the remainder of the calendar year to prevent an ABL for that year from being exceeded, the Tribe's overall harvest activities will not result in local depletion or prevent the gray whale from remaining a significant functioning element of the Washington coast ecosystem.

C. Effects on individual whales.

1. Lethal Takes.

A maximum of seven whales will be struck in any year. The Tribe is committed to making every effort to land a whale once it has been struck. During the Makah whaling seasons in 1999 and 2000, there were no whales that were struck and lost and in 1999, the one whale that was struck was landed (i.e., 100% efficiency). Efficiency is defined as the number of landed whales divided by the number struck (for the purpose of this discussion, there can be multiple strikes on an individual whale; but no more than seven different whales will be struck in any one calendar year).

The Alaska Eskimo Whaling Commission uses a qualitative assessment of the likelihood of survival of a bowhead whale (*Balaena mysticetus*) that has been struck and lost. Hunters report the chance of survival of struck and lost whales as being: "excellent" or "lived;" "good," "fair," or "probably lived;" "poor" or "probably died;" "died;" or "unknown" (Philo et al. 1993). Accurate accountability of struck and lost whales and assigning survival rates are important in determining IWC quotas and in modeling whale population dynamics (Suydam et al. 1995).

The Tribe's waiver request is based on the highly conservative assumption that all individual whales that are struck and lost will have a 0% chance of survival (in terms of considering the MMPA PBR approach). The Tribe will cease hunting activities when seven strikes occur in a calendar year, or when the take of photo-identified PCFA whales approaches the ABL, whichever comes first. Therefore, for the purposes of evaluating the Tribe's request, no more than seven whales per year could be killed. The Tribe's regulations will limit the number of struck and lost whales to no more than three in any calendar year. Under no circumstances will the Tribe allow a strike on a gray whale calf or a gray whale accompanied by a calf.

The hunt will be monitored by biologists from Makah Fisheries Management and from NOAA Fisheries and the Tribe anticipates a thorough, yet still qualitative, approach to assigning survival rates of struck and lost whales to the IWC and NOAA for the purposes of population modeling. If the Tribe were to have a struck and lost whale, the hunt would be evaluated by the Tribe, and the Tribe would implement any improvements as necessary.

In addition to working to minimize the likelihood of any struck and lost whales, the Tribe will take measures which are designed to provide the most humane hunt practicable consistent with the goal of also providing opportunity for Tribal members to engage in a traditional, culturally appropriate hunt. The MMPA defines "humane" in the context of taking a marine mammal as "that method of taking which involves the least possible degree of pain and suffering practicable to the mammal involved." 16 U.S.C. § 1362(4).

The Tribe proposes to use a toggle-pointed harpoon with line and floats attached to originally secure the whale, followed by shot(s) fired at the central nervous system (CNS) from a high caliber firearm to quickly and efficiently dispatch the whale (Ingling 1997). Any of the .50BMG firearm/ammunition combinations are considered more than adequate to humanely

dispatch a gray whale (Ingling 1997). The .50BMG caliber firearm is capable of shooting an Arizona Ammunition solid 570 grain bullet at 3,200 feet/second and generating 13,000 foot-pounds of energy (Ingling 1999). This firearm/cartridge combination can penetrate 240 inches of water, and after using a correction factor, can penetrate the equivalent of 133 inches of flesh. The largest width of a gray whale reported in Perryman and Lynn (2002) was less than 2.8 m (or 110 inches), in which case the .50BMG could create a wound channel completely through the width of the largest gray whale. The flesh covering the portion of the skull housing the brain is under 10 inches thick and the flesh covering the portion of the upper spinal cord is about 18 inches thick on a thirty foot gray whale (Ingling 1997). Considering the overwhelming firepower of a .50BMG caliber firearm, and the size of gray whales, this method is more than adequate to humanely dispatch a gray whale. The gray whale harvested by the Makah Tribe in 1999 expired 8 minutes after the initial harpoon strike (NMFS 2001).

2. Non-Lethal Takes.

In addition to lethal takes of gray whales, the Tribe's waiver request will result in "harassment" of gray whales as defined by the MMPA. The MMPA defines "harassment" to mean any act of pursuit, torment, or annoyance which— (i) has the potential to injure a marine mammal or marine mammal stock in the wild (referred to as Level A harassment); or (ii) has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavorial patterns, including, but not limited to, migration, breathing, nursing, breeding, feeding, or sheltering (referred to as Level B harassment). 16 U.S.C. § 1362(18).

Whales that are not killed in the hunt may be subject to "harassment" as a result of approaches and unsuccessful harpooning attempts that do not penetrate the whale's body and hence do not meet the definition of a "strike." Based on experience with whale hunts in 1999 and 2000, the Tribe estimates that there could be approximately 10 approaches and 4 unsuccessful harpoon attempts for every whale struck.

Approaches would be classified as Level B harassment and would be unlikely to result in any increased level of human-caused mortality to individual whales. Gray whales feed, migrate, breed, and calve close to shore, and therefore they encounter humans on vessels throughout their range. There is a major tourism industry that provides opportunities to watch gray whales on the winter breeding grounds in Mexico. Commercial and private whale watching occurs during the migration along the west coast of the United States and Canada. Gray whales encounter commercial fishing vessels in Bristol Bay, and small craft used by Chukotka natives and Alaska natives in the Arctic. Off the coast of Los Angeles, California during the whalewatching season, Rugh et al. (1999) reported that there can be eight to 12 boats following a single whale. The number of approaches incident to Makah whaling will be minor in comparison to these existing sources of harassment. Assuming an average pod size of approximately two animals during the migration period in the Pacific Northwest (Green et al. 1995), the number of whales subject to Level B harassment in a calendar year will not exceed 140**.**

Unsuccessful harpoon attempts would probably be classified as Level A harassment. However, because the harpoon would not penetrate the body of the whale on the attempt,

unsuccessful harpoon attempts would not result in any increase in human-caused mortality. NOAA (2001) concluded, based on their experience with biopsy darting research, that instances where a harpoon did not penetrate the whale would not likely have a significant adverse effect on whale behavior. Clapham and Mattila (1993) assessed behavior of humpback whales (*Megaptera novaeangliae*) in relation to both successful and unsuccessful biopsy attempts. Of the 427 missed biopsy attempts, 87.8% of the time the whales showed no reaction. Missed harpoon strikes would be analogous to missed biopsy attempts, where a projectile lands in the water nearby a whale, but does not cause contact. Clapham and Mattila (1993) reported that of the successfully biopsied whales (n = 565), 66.6% showed no detectable reaction or a low-level reaction (defined as a brief startle or a quick submergence, or both). Because a biopsy indicates a direct hit and therefore removal of a small piece of blubber and skin, for the purposes of assessing adverse effects, a biopsy would cause a more substantial effect than, for instance, a shaft of a harpoon bouncing off a whale. Accordingly, the Tribe does not believe that unsuccessful harpoon attempts (i.e., missed harpoon throws or the situation of a harpoon glancing off the animal) should be accounted for as a source of human-caused mortality for the purposes of applying the PBR methodology. In any event, no more than 28 gray whales will likely be subject to Level A harassment in any calendar year under this request.

D. Factors to be Considered in Prescribing Regulations.

This section provides an analysis of the five factors set out in Section 103(b) of the MMPA, 16 U.S.C. § 1373(b) which the Secretary must consider in prescribing regulations to implement the Tribe's waiver request.

1. Existing and Future Levels of Species and Stocks.

Section 103(b)(1) instructs the Secretary to consider "existing and future levels of marine mammal species and populations stocks." 16 U.S.C. § 1373(b)(1). The critically depleted Western North Pacific stock of gray whales which migrates along the east coast of Asia (Rice and Wolman 1971) will not be affected by this request. As shown above, the Eastern North Pacific stock of gray whales is currently within its OSP range. Even with the level of take proposed in this request, the stock is not likely to diminish below OSP within the foreseeable future. In 2002, the IWC's Scientific Committee estimated that a take of up to 463 whales per year would be sustainable over at least the medium term (~30 years) (IWC 2003). This level of take is substantially higher (by almost 350 percent) than the average annual joint US-Russian quota of 124 whales per year as well as a conservative estimate of all human-caused mortality in a given year. Any regulations promulgated to implement the Tribe's waiver request should provide for reduced strike limits or suspension of the hunt if necessary to prevent the abundance of the Eastern North Pacific stock of gray whales from falling below OSP.

2. Existing International Treaty and Agreement Obligations of the United States.

Section 103(b)(2) directs the Secretary to consider "existing international treaty and agreement obligations of the United States." 16 U.S.C. § 1373(b). The Tribe's request is

consistent with current IWC regulations which provide for an aboriginal subsistence quota of 620 gray whales between 2003 and 2007, with a maximum take of 140 gray whales in any one year. By bilateral agreement between the United States and the Russian Federation, up to 20 gray whales may be taken from this quota by the Makah Tribe over the five year period, with a maximum of five whales in any one year. The Tribe's request is also consistent with the IWC's prohibition against the taking of calves and whales accompanied by calves. The number of takes and strikes allowed under this request, as well as the time and manner of harvest, may be subject to reduction if necessary to meet the international treaty obligations of the United States under the International Convention for the Regulation of Whaling (ICRW).

3. The Marine Ecosystem and Related Environmental Considerations.

Section 103(b)(3) requires the Secretary to consider "the marine ecosystem and related environmental considerations." 16 U.S.C. § 1373(b)(3). As discussed above, the Tribe's request is designed to maintain the Eastern North Pacific stock of gray whales at or above an OSP level and to prevent any depletion of the abundance of gray whales along the Pacific coast south of Alaska and within the ORSVI survey area. These measures will ensure that Eastern North Pacific gray whales remain a functioning part of the ecosystem on multiple spatial scales: throughout the migration corridor; the Pacific coast south of Alaska; as well as the local region surrounding the Makah U&A.

In the past, concerns have been raised about the impact of the hunt on seabirds and the safety of the high-powered rifle. The Tribe believes that these concerns are greatly mitigated by its current request which prohibits hunting from June 1 and November 30 and within the Strait of Juan de Fuca. To address further concerns about the impacts of whaling on nesting seabirds, the Tribe proposes a restriction barring any gray whale from being struck within 200 yards of Tatoosh Island or White Rock during the month of May. The Tribe also intends to implement safety measures in their Tribal regulations which are no less protective of public safety than those provided for in its 2001 gray whale management plan (Makah Tribal Council 2001).[11] Further measures to address impacts to other species and public safety may be developed and implemented based on the outcome of the NEPA process.

4. Conservation, Development, and Utilization of Fishery Resources.

Section 103(b)(4) of the Act instructs the Secretary to consider "the conservation, development, and utilization of fishery resources." 16 U.S.C. § 1373(b)(4). No impacts to fisheries, either positive or negative, are expected to occur as a result of the Tribe's request.

5. Economic and Technological Feasibility of Implementation.

[11] These measures authorized the discharge of firearms when whaling only when the shooter was within 30 feet of the target area of the whale and the shooter's field of view was clear of all persons, vessels, and other objects that could result in injury or loss of human life. The measures also set minimum visibility standards for the hunt (Makah Tribal Council 2001).

Section 103(b)(5) of the Act instructs the Secretary to consider "the economic and technological feasibility of implementation." 16 U.S.C. § 1373(b)(5). The Tribe believes that its request will be entirely feasible to implement. The hunting methods called for in its request are not intended to be intensive, but have proven to be effective within the context of the Tribe's goal of providing opportunities for a traditional ceremonial and subsistence whale hunt.

The request should be quite feasible to implement from a management standpoint. The Tribe's waiver request is no more complex than numerous Treaty fisheries that the Tribe has managed in cooperation with NOAA Fisheries and the Washington Department of Fish and Wildlife over the past three decades. With one exception, the proposed management regime is very similar to that which the Tribe successfully implemented in 1999 and 2000. The one major addition is the photographic monitoring of the harvest to ensure that the ABL for the PCFA is not exceeded in any calendar year. The Tribe will have a qualified marine mammal biologist on staff who will administer these provisions in consultation with NMML biologists. In the event that the Tribe is unable or unwilling to effectively implement and enforce Tribal regulations, these requirements will be subject to direct enforcement by NOAA Fisheries enforcement personnel.

VI. Conclusion.

NOAA should approve the Tribe's request for a waiver and adopt regulations that permit the Tribe to exercise its treaty rights in the manner specified in this application. The proposed waiver is necessary for the United States government to fulfill its legal obligations to the Tribe under the Treaty of Neah Bay, will not disadvantage the Eastern North Pacific stock of gray whales, and will be consistent with the purposes and policies of the MMPA.

Whale Hunting and the Makah Tribe:
A Needs Statement

Ann M. Renker, Ph.D.
March 2002

TABLE OF CONTENTS

Whale Hunting and the Makah Tribe

I. INTRODUCTION

This document presents information pertinent to the continuation of the Makah subsistence whale hunt, and is presented in two parts: a cultural component and a nutritional component. The Needs Statement demonstrates the following points:

1) Whale hunting for subsistence purposes is an activity Makahs practiced for at least 1,500 years before the present day. Documented use of whale products for subsistence purposes extends another 750 years before this date, since Makahs used drift and stranded whales long before hunting technology developed. Continuation of the restored whale hunt will maintain important subsistence benefits reintroduced to the Makah community in 1999. This benefit increases in importance as the unemployment rate in Washington State increases and as salmon and other Pacific fishing stocks continue to vary in abundance. Increasing variance in international and domestic fishing quotas diminish the reliability of the marine subsistence component of the Makah Tribe, along with the environmental pressures exerted by oil spills, red tides, pollution, and other factors beyond the control of the Tribe. Gray whales are a reliable resource that can offset subsistence pressures from other sources.

2) For 1500 years, whale hunting and its associated components have had important ceremonial and social functions for the Makah community, in addition to the provision of subsistence benefits. The importance of this ceremonial and subsistence practice is demonstrated in the Treaty of Neah Bay, signed in 1855. Makah negotiators insisted that the right to hunt whale be included in the treaty; this right is reserved in Article IV, and is discussed in more depth later in this document.

Elders and anthropologists trace the decline of the social and physical health of the tribe to the elimination of the whale hunt and its associated ceremonial and social rigors. A community survey conducted in 2001 December, demonstrated that an overwhelming majority (93.9%) of the village believes that the resumption of the whale hunt has positively affected the Tribe, and 51.6% specifically cited moral and social changes as the most important benefit. Clearly, the Makah people believe that the restoration of the hunt has contributed to the physical and mental health of the reservation. Continuation of the hunt will maintain this new-found motivation and momentum, and allow the Makah community to redefine and refine ancestral information and values in light of modern times. The revitalization of the hunt has allowed Makahs an additional mechanism to instill the traditional values of the Tribe which help young and old to conquer the vicissitudes of modern life.

3) The Household Whaling Survey (Renker 2002) provides an important tool which provides empirical support for the emotional and psychological benefits mentioned previously. Data indicated that an overwhelming majority of Makah respondents support the Makah whale hunt, and that most reservation households now desire whale products to be a regular part of their diets. For example, 86.5% of survey respondents wanted whale meat in their households on a regular basis, and 72.4% of the survey respondents felt the same way about whale oil. (Survey results are discussed in detail in later sections of this document.) The results of this survey present a good picture of the mainstream opinion of the Makah people.

4) The Makah Tribe has been actively involved in the management and protection of its wealth of resources for millenia. For thousands of years, the Makahs achieved and maintained a functional balance with many land, air, and ocean species, especially the gray and humpback whales. This carefully constructed dynamic was upset during the years of unregulated whale hunting by others on the Pacific Coast. The restored Makah whale hunt has not affected current eastern Pacific gray whale stocks negatively, and is small in comparison to the total aboriginal subsistence harvest. In fact, current figures indicate that the gray whale population continues to maintain numbers that are at historic high levels.

5) The Makah people can now actively demonstrate the continuing existence of their 2,000 year old subsistence culture. The whale had always played an integral part in the subsistence practices of the Makah Tribe, save the brief seventy year period which commenced in the 1920s. While the decimation of the whale herds made it virtually impossible for Makahs to procure the food which traditionally carried the most extraordinary social, cultural, and nutritional benefits, the restored hunt provides modern Makahs with a rich source of traditional foods which are nutritionally superior to many non-indigenous provisions which are available to the community.

The gray whale population now exceeds early historic levels. The Makah subsistence and ceremonial need to take whales should continue to be recognized and respected. Since the Tribe has a conservation record of considerable time depth, a limited subsistence whale hunt will continue to be easily managed. More importantly, another annual quota of five whales will maintain the benefits secured for future generations of Makah people by Treaty negotiators.

The Makah request for five whales is again predicated on the fact that Tribal membership is now composed of the residents of the five traditional Makah villages which were consolidated during the early years of the Reservation. Since Treaty times, the Makah Tribe has always represented itself as a nation which began as five villages. This request honors this tradition, and asks for one whale per village.

In addition, a review of the ethnographic literature finds that the number five, whether an actual figure or an average, appears multiple times in discussions of early historic harvests (Jewitt 1815, Cavanaugh 1983, Huelsbeck 1988). Five whales per year did not create an undue population stress for a healthy gray whale stock in the years prior to 1830, and would not adversely affect the modern, healthy, gray whale population of the eastern Pacific (Environmental Assessment 2001).

METHOD STATEMENT

Interpretation of Makah history, culture, and language is accomplished through the juxtaposition of a variety of sources. By evaluating evidence from Makah archaeological sites (like Ozette),in conjunct with oral histories, linguistic information, ethnographies, and early written records of traders, explorers and agency employees, one generates a cultural profile that simultaneously integrates and cross-references these distinct sources of data.

The primary source of archaeological data substantiating the existence of Makah pre-Treaty whale hunts and offshore fisheries is the Ozette Collection, the largest and most comprehensive collection of pre-contact Makah artifacts in the world. The Ozette village was one of five pre-contact Makah villages which were occupied throughout the year: **di.ya** or Neah Bay; **bi?id?a** or Biheda; **wa?ac'** or Why-atch; **c'u.yas** or Tsoo-yess; and **?use.?i=** or Ozette (Taylor 1974). Unlike the others, Ozette was partially buried by a catastrophic mudslide approximately 400 years ago. A massive archaeological excavation from 1970 - 1981 uncovered 50,000 artifacts that were remarkably well preserved; these artifacts tell the story of the Makah culture as it was prior to contact with non-Indians (Wessen 1982, Huelsbeck 1983).

When interpreting the anthropological literature, a standard procedure relating to the classification of the Makah culture as a member of the Nootkan cultural group was followed. The Makah culture is the only example of a Nootkan culture outside of Canada; all other Nootkan groups reside along the western and southwestern coast of Vancouver Island. Scholars recognize the close relationship between Makah and the other members of the Nootkan cultural category (Curtis 1911, Drucker 1951, Driver 1969, Arima 1990, Renker 1994). It is therefore standard practice to consider sources relating both to the sub-group which is the focus of inquiry (Makah), and nearby closely related sub-groups on Vancouver Island (**nu.ca.nu.=** bands).

For the nutritional component of the Needs Statement, the document utilized the methodology and definitions endorsed by the United Nations University and the International Union of Nutrition Science's Committee on Nutritional Anthropology.

The methodology for the Household Whaling Survey (Renker 2002) is discussed in Appendix 3.

Definitions

Pre-contact refers to the chronological time period prior to 1788. **Historic** refers to the chronological time period from 1788-1933. **Contemporary** refers to the chronological time period from 1934 till today.

A Makah elder is an individual who is enrolled in the Makah Tribe, is over 75 years of age, and is a native speaker of the Makah language.

Westcoast refers to the generalized cultural group of Makah, Nitinaht, and Nootkan peoples. **nu.ca.nu.=** refers only to Nitinaht and Nootkan peoples since these people are closely related subgroups who live on Vancouver Island.

Subsistence refers to the anthropological concept that a particular food product or supplement is directly acquired by th people who will use the item for local consumption and nutritional purposes.

Linguistic and Other Conventions

Elements of the Makah language (morphemes, words and the like) are printed in **bold** type to enhance visibility. Because of the limitations affecting the preparation of this opinion, I use a variation of the Makah Alphabet. A key to the adaptation used this document is included in Appendix 1.

Indented citations with quotation marks are taken from oral histories. Indented citations without quotation marks are from written sources.

II. WHALE HUNTING AND THE MAKAH TRIBE: THE CULTURAL COMPONENT

Cultural Abstract

Anthropologically, the Makah culture is classified within the Nootkan sub-division of Northwest Coast cultures. The Makah people speak a language, **q*i.q*i.diccaq**, which is classified as a member of the Wakashan language family. The Makah Tribe is the only representative of the Nootkan cultural classification and the Wakashan language family in the United States (Renker and Gunther 1990; Renker 1994).

Classic descriptions are exemplified in Swan (1870), Curtis (1911), Waterman (1920), and Densmore (1939); some of the more recent publications include Renker (1994) and Renker and Gunther (1990), which span pre-contact through contemporary times, as well as Parker-Pascua (1991), which concentrates on Makah pre-contact life. Like all cultures termed Northwest Coast cultures by anthropologists, the classification is based upon factors first identified in these cultures as each existed in early historic times. Makah culture exhibits a number of characteristic Northwest Coast traits and trait complexes, including:

1. Emphasis on achieved wealth as measured in property and hereditary rights;

2. Complex patterns of social stratification;

3. A highly developed painting and wood carving style;

4. A material culture based on the abundance of the wood resource in the area, especially when related to the absence of other technologies, such as ceramics; and,

5. A subsistence pattern based on the utilization of available marine, riverine, subtidal and intertidal resources, as well as a predictable supply of anadromous fish.

The factors which further classify the Makah culture within the Nootkan sub-division provide a more detailed list of items which distinguish the Makah culture from other American Northwest Coast cultures. These factors include: a)the integration of rank and kinship as the basis for social interaction (Drucker 1951); b) the integration of land and sea spirits in a ceremonial complex which featured both inclusive and exclusive secret societies and events (Curtis 1911, Sapir 1939, Sapir and Swadesh 1955); c) the development of a highly regulated system of ceremonial and economic privileges, including the ownership of, and control over, tangible and intangible properties such as whaling grounds, fishing grounds, and other sections of ocean and river property (Curtis 1911, Densmore 1939, Drucker 1951); and d) the development of ocean-going technologies like fixed referent

navigation and the construction of sea-worthy canoes (Drucker 1951, Renker and Pascua 1989).

These last technologies are prominent components in the most dramatic pursuit of the Makah Tribe: whale hunting. Several Pacific coastal Tribes utilized dead whales which happened to drift onto the shore, or cultivated ritualists who actively used sympathetic magic to entice these drift animals. In contrast, the Makahs and some of their Vancouver Island relatives were famous for their active and aggressive hunt of these large sea mammals (Swan 1870, Waterman 1920, Densmore 1939).

The Whaling Culture of the Makah Tribe

The relationship between Makah people and whales is one of great antiquity. Archaeological data from a recent excavation at the Makah village of Wa-atch indicate that whale bones were present some 3,850+ 75 years b.p. (before present) (Wessen 1994). Food use of drift and stranded whale predated hunting technology. Better known data from the Ozette site demonstrate some 1,500 years of continuous whale use. This practice continued through the period of contact with non-Indians, and persisted into this century. Recorded history provides a variety of dates for the last Makah whale hunt prior to 1999; it probably happened during the latter half of the 1920s (Laut 1928).

Archaeological and ethnohistorical data demonstrate that Makahs hunted a variety of species of whale which traveled through their territory, including the gray (Eschrichtius robustus), humpback (Megaptera novaeangliae), finback (Balaenoptera physalus), and right whales (Eubalaena glacialis). Huelsbeck (1988a:5) discusses the traits which make both gray whales and humpbacks attractive prey. In addition to swimming slowly and near the shore, both types of whales could appear during the summer. Humpbacks have also been known to migrate along the coast, but not to the extent that gray whales do. Non-Indian whale hunters characterize the gray as the more aggressive species of the two during a hunt (Hagelund 1987).

There is no doubt that Makah people hunted whale in pre-contact times, and that the hunt was an important subsistence activity. The Ozette site yielded whale hunting gear and over 3400 whale bones, including whale bones with embedded harpoon shell blades (Huelsbeck 1988a:1).

The archaeological record is supported by ethnographic sources like the Jewitt Narrative, one of the most interesting and important first person accounts generated during the European exploration of the Pacific Northwest Coast. John Jewitt was one of the surviving crew members of the ship Boston, which was ravaged and sunk by the **nu.ca.nu.**= Chief, Maquinna, in Nootka Sound in 1803. Jewitt remained in Maquinna's service as a slave until his rescue in 1805, and recorded his experiences and observations in a diary first published in 1815.

In spite of his ethnocentrism and lack of knowledge of nu.ca.nu.= culture, Jewitt's observations remain a key document in the early historical record of the area. Jewitt describes the enormous amount of time Maquinna and his crew invested in the pursuit of offshore whales in 1804 and 1805. During these years, Maquinna had only one successful hunt.

Cavanaugh (1983) indicates that Maquinna's lack of whale hunting success during the 1804 and 1805 seasons at Nootka Sound was not indicative of the fate of other hunters. While Maquinna secured one whale during Jewitt's captivity, hunters procured an additional four whales. Simple addition indicates that the people of Nootka Sound had the food and product resource of five hunted whales at their disposal.

According to Huelsbeck, calculations produce a scenario based on abundance, rather than paucity. Using a very conservative estimate, the five whales caught at Nootka Sound "would have provided between 16.25 and 37.5 metric tons of blubber, and could have provided a similar amount of meat, depending on whether or not the California gray or the larger humpback whale was taken" (Huelsbeck 1988b:3). This huge quantity of meat and blubber could have provided between 32.5 and 150 kg. of edible whale product per person for a village with a population of 500 individuals (Huelsbeck 1988b:4).

Certainly the number of whales taken by all Makah crews varied from year to year. A minimum of 67 whales were "represented by the bones recovered from the late prehistoric level" at Ozette (Huelsbeck 1988a:7), constituting a huge quantity of food products and raw material. Based on historic documents, Huelsbeck estimates that whalers of the Yuquot band, a nu.ca.nu.= group, "would have averaged 5 whales per year" (1988:157). Densmore reports a much higher success rate for historic Makah whale hunters. "In old times the average catch for a whaler was one or two whales a year, but a man often caught four and occasionally five in a season" (1939:63). Wilcox (1895:20) provides a more conservative appraisal of the Makah whale hunt for the years 1889-1892. His figures indicate that the Makah Tribe averaged 5.5 whales per year (as cited in Huelsbeck 1988:152) at a time when the cetacean population had already been severely impacted by other, non-Makah whaling interests.

Makah whale hunting capitalized on the annual northerly migration of the gray whale, and the availability of the humpback in their waters. Archeological data corroborate Makah oral history in this regard. In the Ozette Collection, 50.51% of the whale bones identifiable by species were that of the gray, while another 46.51% came from the humpback (Huelsbeck 1988a:4). The remainder of the sample contained finback, right, sperm and killer whales. Huelsbeck interprets the archaeological and ethnohistorical data to indicate that the finback and right whales were hunted from time to time, while the sperm and killer whales "probably represent drift whales" (1988a:6), although some Makah families have oral traditions which involve hunting these species.

The impressive gray whale migration approximately occurs from March to May, and provided a predictable resource that could be harvested by eight man whaling crews which set forth in large cedar canoes. In one hunting strategy, lookouts stationed at strategic points could see a whale and alert the proper individuals, providing enough opportunity for canoes at the ready to launch and chase the whales. (This type of whale hunt, termed an offshore hunt in Hagelund (1987) and Webb (1988), would be adopted by the non-Indian whaling interests in the area centuries later.)

Whale hunts were not restricted to this northerly migration, however. Densmore (1939:49) reports that Makahs distinguished spring whale meat from winter whale meat:

> The whales that "run in the spring" and were known as "spring whales" were said to have red meat because they ate clams and other shellfish they scooped off the rocks. The "winter whale" was considered the best and had a layer of white fat on the outside and red meat underneath.

Whatever the season, the whale hunt tested the training and stamina of the entire crew. A lucky crew might take a whale within a few miles of shore, while some hunts found Makah crews towed thirty or more miles out to sea by an injured whale. Whale hunters told Densmore that

> A wounded whale usually towed the canoe by means of the harpoon rope, held by the men, its speed depending on the severity of its wound. Sometimes the whale went so fast that the end of the canoe went down in the waves. This towing of the canoe might continue for three or four days, the whalers waiting until the whale became sufficiently weary to be dispatched (1939:52).

These great sea mammal hunts (Swan 1870, Waterman 1920), as well as interceptive and deep water fisheries, would not have been possible without a highly developed system of fixed referent navigation, and a keen understanding of the prevailing winds and weather patterns in Makah marine territory. (One appreciates Makah navigational skills more thoroughly when one considers that Captain Cook failed to "discover" the opening of the Strait of Juan de Fuca because of the thick fog.)

An example of the Makah fixed referent system was provided by a Makah elder who has been fishing since the 1920s.

> "There's a ridge on Vancouver Island, I think the main peak there is behind Carmanah Light, and that's Carmanah mountain. That's the highest one, and there's a ridge behind that as you venture to the west, one peak will show up behind that as you venture to the west, one peak will show up behind that high peak on the ridge. The first one is **c'akwaqabas**, the second one is **?a7qabas**, and then you have a low kind of ridge, it drops down for quite a ways, and then another peak shows up, and that's in...oh...mostly used for sealing grounds, called The Spit. Now I have electronic navigational equipment, and I look upon those landmarks to determine just where we actually were when we were one peak out, two peaks out, or seven peaks out."

When navigating out of sight of land, Makah seafarers relied on the prevailing winds and currents, as well as the shape of the waves and behavior of seabirds. For example, prevailing winds in the early morning are mostly easterly, and their afternoon counterparts are mostly westerly. Makah canoes ventured out of the sight of land knowing that attention to wind, wave, and fauna would return the vessels to land.

Makah ocean voyagers also understood that these navigational techniques could lead them directly to prime off-shore fishing and whaling areas. In the words of an experienced Makah fisherman,

> "Prevailing currents, can predict them. They run on schedule. They tell direction and duration...Once off shore, the current changes every six hours: north to south, then south to west, then west to north, then north to east. A massive current moves all the time. Currents are predictable and steady...able to predict spawning areas."

Great cedar canoes provided the means for Makah seafarers to travel these great distances offshore. Fisherman, sealers, and whale hunters each used a different type of canoe which varied in size. The whaling canoe was approximately 36 feet long (Pascua 1991) and five or more feet wide (Arima 1983:35). Carvers fashioned these vessels from a single cedar log, providing canoes that "deserve the very highest place for staunch seaworthiness, coupled with great manageableness (sic) and speed" (Waterman 1920:9).

A whaling crew consisted of a chief, or the whaler, and seven men. The whaler owned the canoe and the whaling equipment, and acted as the sole harpooner in the whaling canoe. He also owned

important ceremonial privileges acquired through his hereditary status and his ability to interact with the natural and the supernatural to assure a successful hunt.

Other crew members included a steersman, a man responsible for managing the lines and buoys, numerous paddlers, and a man who had a unique responsibility once the hunt was over and the whale was dead. This crew member, a diver, fastened the whale's mouth shut with a length of rope. In addition to sealing in gases which kept the whale afloat, fastening the mouth prevented water from filling the carcass and sinking it (Curtis 1911; Waterman 1920; Pascua 1991).

Whaling was restricted to the men who could physically and mentally withstand the rigors of intensive ritualized training, possessed the hereditary access to the position and its ritualized knowledge, and/or a underwent a supernatural encounter which engendered the gift of whaling ability (Waterman 1920:38-40, Gunther 1942, Drucker 1951:169-170).

All crew members underwent rigorous ceremonial and spiritual preparations prior to beginning a hunt; the success of the hunt depended as much on the observance of ritual as the strength and talent of the hunters (Sapir 1939:114).

> From the white point of view, the matter of greatest concern would be the arrangement of the tackle within the boat, and the methods of approaching and striking the quarry. From the Indian standpoint, however, the really important matter is the proper observance before and during the hunt of the various ceremonial performances for procuring help from the spirits. (Waterman 1920:38)

Curtis (1911) provides the most detailed accounts of rituals whalers used to prepare themselves for the hunt.

> Prayers and numerous songs form a part of every whaler's ritual. The secrets of the profession are handed down from father to son. As soon as the boy is old enough to comprehend such matters and to remember his father's words, he is permitted to accompany the whaling crew on short expeditions. Now also begins his instruction concerning the most propitious spots for ceremonial bathing-places in lakes and rivers considered the most dangerous. At the age of twelve he is taken at night and shown how to bathe and to rub his body with hemlock twigs so as to remove the human taint and render the body acceptable to the whale spirit which is being supplicated. Thereafter he bathes alone at intervals, while

> his instruction in prayers and songs continues until the father deems it proper to retire in the young man's favor (16).

These ceremonial rigors extended to the wives and relatives of the whaling crew, the chief's wife in particular. "Therefore, the whaler and his wife observe a long and exacting course of purification, which includes sexual continence and morning and evening baths at frequent intervals from October until the end of the whaling season...about the end of June" (Curtis 1911:16). This woman was expected to observe a strict set of behaviors while the crew was hunting on the ocean, or else cause havoc with the crew at sea. For example, the whaler's wife was required to lie still and utterly motionless the entire time the crew was hunting on the ocean. Lack of attention to this and other proscribed behaviors could also result in the capture of a whale that was not fat or large enough, or cause the harpooned whale to run out to sea instead of in toward the shore (Gunther 1942).

Physical equipment was also important to the pursuit of the whale. Makah whaling equipment consisted of, but was not limited to: harpoons, sealskin floats, fathoms of line made from whale sinew, fathoms of line made from cedar, and a variety of knives (Curtis 1911:16). Detailed discussions of the equipment and its use are found in Swan (1870) and Waterman (1920). Makah archaeological excavations, most notably Ozette, produced assemblages of this equipment, some of which are now on display at the Makah Tribe's museum and cultural center.

There is an amazing continuity which surrounds Makah whale hunting gear. Pre-contact whale hunting equipment found at Ozette is essentially equivalent to whale hunting gear used by Makahs during the middle and late historic period. This amazing continuity does not exclude innovation. Makah whale hunters appreciated innovation and the opportunity to improve the hunt. By the turn of this century, Wilson Parker, the Makah Whaler of Curtis' photo fame, used a metal Lewis Toggle Hook Harpoon Head on the end of his traditional yew wood harpoon, for example. Another innovation helped to cut the tedious and tiring job of endless paddling: whaling canoes accepted tows from steamers to and from the whaling grounds when the technology became available.

The Makahs hunted the variety of whales which swam in their traditional ocean areas, but favored the predictable gray whale. Descriptions of the hunt itself are available in Swan (1870), Curtis (1911), Waterman (1920), Drucker (1951), Arima (1983) and Pascua (1991).

> It would take a long time to get close to the whale while it was on the surface. Eventually, the crew brought the canoe alongside approaching on the left side and from the rear where the whale could not

> see them. The right time to harpoon was when the whale was just submerging, with its flukes well under and swung towards the canoe so that the animal would swing away in reaction and not smash the canoe (Chief Jones, personal communication). The steersman watched to see the flukes were in the right position and gave the signal to the harpooner who immediately drove the harpoon in behind the fore flipper. At once the canoe was swung sharply to the left away from the whale, and the first float was thrown out by the first right-handed paddler behind the harpooner who quickly crouched in the bow to avoid the line paying out. The next paddler back held his paddle under the line to have it run out smoothly from the space before him. The dangerous moments lasted until all the line and floats were all out because someone could get caught in a loop or the canoe could be capsized or smashed in the first violent struggles of the whale before it sounded. Any disaster that happened was thought due to the incorrect observation of tabus or performance of rituals (Arima 1983:41).

Once the first harpoon had been driven into the whale and the first set of floats were secured, a long lance was used to "attack the whale, making it bleed profusely" (Densmore 1939:50). Makah whalers told Densmore that the process of killing a whale, from first harpoon to final dispatch, could take "three to four days" (1939:52).

The successful whaler and his crew now had to tow the enormous animal and navigate their precious whale back to land, a process which could take two days (Densmore 1939:52). Unfortunately, the long delay in landing the animal could allow putrefaction to begin, thus causing the loss of the meat. The blubber would not be adversely affected by this long journey back to the beach.

Ideally, the whaler wanted to land his prize on his own beach at his own village. Using the tide to help him, the whaler beached the carcass at high tide, "to get the bones of all his whales in one spot" (Arima 1983:43). If a whaler had to beach his catch on another whaler's beach, payments had to be made; these often consisted of portions of the whale.

As the whale was staked and readied to be butchered, the community gathered for this event. Strict protocol governed the butchering process, specifying which portions of the whale were to be cut in sequence. Some regulations identified the pieces of the whale which had to be decorated and ceremonially treated. Others specified which portions were distributed to crew members and other village inhabitants. "Then pieces were given to the

rest of the Tribe in order of rank, a procedure which was always carefully observed" (Arima 1983: 43). In effect, the distribution of the whale reinforced the infrastructure of Makah society each time the process occurred.

The highly stratified nature of the Makah social system was a mirror of the status and structure involved in the entire process of the whale hunt. From ceremonial preparation, to the hunt itself, to the ultimate acts of butchering and distribution, Makah whaling actualized the social organization of Makah society. The man who acted as the harpooner for a crew was the chief, or headman, of a particular social group, usually the residents of a single longhouse. He owned the longhouse, the whaling canoe and the equipment. This man also retained the largest burden of ceremonial preparation. These two factors, a large degree of physical wealth and a close relationship with the supernatural, translated into power for the whalers in everyday life.

Whalers, or headmen, were ranked at the top of the pyramid of social standing which existed within a single longhouse. Each resident was affiliated with the headman in some way; this affiliation became the basis for ranking each individual within a residence group. Whaling generated a base from which these relationships were constantly renewed and reinforced. A successful headman could offer prestige, protection and resources to the kin and non-kin residents of his longhouse. A headman who experienced consistent failure, ostensibley because of poor preparation and ineffective supernatural connections, could lose status within his household, and lose non-kin residents as a result. The loss of these residents often translated into a loss of physical wealth and social prestige for a headman.

The anthropological literature tends to concentrate on the role of high-status men in the whale hunt. Makah oral history and articles like Gunther (1942) demonstrate that women played an important social, ceremonial and practical role in the whale hunt complex. Men, for example, were not the only ones affected by relationship between the whale hunt and social status. The women who married whalers dominated the top of the female analog to the male status pyramid. These women, like their male counterparts, found their lives governed by the concept of primogeniture. While whalers tended to be the oldest son of the oldest son of a whaler, the whaler's wife tended to be the oldest daughter of an oldest daughter of a whale hunter. Matches between the oldest son of one whaler and the oldest daughter of another were the ultimate social goal of whaling families. These alliances united two powerful, wealthy families, and insured that consolidated social, ceremonial, and political power would be transmitted to another privileged generation; this procedure is common to historical and contemporary royal families.

Oral history and anthropological documents attest to the fact that the Makah whale hunt generated a series of criteria which governed social processes like status assignations, marriage

preferences, and ceremonial displays. The community-at-large played an important role in the success of the whale hunt, even though its role is far less visible in the written record. While anthropologists were most interested in the ceremonial, social and work activities of the privileged classes, it was the support labor that processed, preserved, and prepared the whale products, as well as conducted the trade activities. People of extraordinary talent in any of these activities were recognized and recompensed by those of higher social status. These people of talent, when combined with a high status chief, resulted in a longhouse with a reputation for great things.

Therefore, whale hunting provided more than a means of organizing social groups within a longhouse; the whale hunt also provided a mechanism by which longhouses in a single village related to each other. Accumulated ceremonial and economic wealth often provided a means to rank the whalers, or headman, vis a vis each other. This ranked order precipitated to the residents of each longhouse. In effect, whaling generated a social dynamic which ranked all Makah individuals within a residence group, a longhouse. The practice also generated a social dynamic which ranked all Makah individuals in relation to the inhabitants of all other longhouses. Whaling was the warp and the woof of Makah society.

In addition to providing the whalers with ceremonial privileges, and Makah society with a governing principle and a means to subsistence security, the Makah populace received other benefits from whale hunts. These benefits included, but were not limited to the following:

1. Whale products such as blubber and oil proved an important source of trade goods. The Makahs served as the middlemen in a huge trade network. Because of their geographical advantage, Makahs operated a critical position in a network which functioned north and south along the Pacific Coast, as well as from the Pacific Coast to the Puget Sound (Swan 1870, Renker and Gunther 1990, Renker 1994). Whale products insured that the Makah people enjoyed a high standard of living with diversified interests (Huelsbeck 1988).

2. Whale products provided a substantial food resource for the Makah people. Early archaeological studies indicate that as much as 84.6% of the Makah pre-contact diet could have been composed of whale meat, oil and other food products (Huelsbeck 1983:43). Recent collaborative efforts between Dr. Huelsbeck and marine biologists have resulted in an adjustment to this early statistic. The projected size of the gray whales found at the Ozette site was too conservative; the mammals could easily have provided 100% of the food for the Makah Tribe (Huelsbeck 1995: personal communication). Clearly, whale products fulfilled important subsistence functions. In addition to nutrition, 25% of bone tools found at Ozette were made from whale bone.

3. The skills needed to hunt whales on the open ocean easily

transferred to Makah offshore activities, including deep water and interceptive fisheries and seal hunting. These pursuits provided additional sources of trade items and food.

4. Ceremonies needed to prepare whalers and their respective families for the hunt provided the Makah culture with a social framework that contributed to governmental, social, and spiritual stability.

The four cultural points articulated here have corollaries in the modern world. In relation to trade, the Makah Tribe signed an agreement with the United States Government which restricted the sale of whale products which were generated from whales harvested under the IWC quota. This agreement does not restrict Makahs from utilizing the subsistence-based redistribution networks that already existed within the reservation. Data clearly indicate the presence of localized networks that aid in the redistribution of whale products, particularly to family members who were not adept at processing and preparing whale themselves (Renker 1988, Aradanas 2001, Renker 2002).

Whale products have become a significant food resource for modern Makahs, in spite of the fact that only one whale has so far been successfully hunted during the first IWC quota period. In fact, a drift whale which washed ashore in an isolated part of Makah territory, was butchered and distributed to over 100 Makah households during the summer of 2001. This event is significant because the increasing Makah demand for whale products motivated more Makahs to utilize the drift whale, and return the meat, blubber, bone, and other parts to Neah Bay by boat. Since the whale was located on a remote beach with no road access, a small fleet of boats ferried whale parts from the beach to the boats, then back to Makah households.

Makahs are utilizing whale food products such as meat, blubber, and blubber rendered into oil, as well as other whale parts not as well known to non-Makahs: eyes, brain, heart, cheeks (the Makah reference to the jaw muscles and the fleshy area under the eyes), and the like. Modern Makahs have quickly rediscovered their ancestral appetite for whale products: 72.4% of surveyed households would like whale oil on a regular basis, 86.5% would like whale meat on a regular basis, and 55.8% would like blubber on a regular basis. Numerous survey respondents indicate a preference for sea mammal products for both traditional and health reasons (Renker 2002).

The significance of the whale as a food resource is also apparent when examining the variety of preparation methods in use on the Makah reservation. One might expect a paucity of recipes and techniques for preparing whale meat and blubber, given a seventy year gap in actuality. Instead, respondents provide the following data. Of the 61.3% of the respondents who received whale meat from the 1999 whale, 41.5% made jerky, 43.9% ate roasts, 41.5% cooked stew, 35.4% grilled steaks, and 34.1% smoked meat. 19.5% of respondents also indicated a preparation methods

other than those offered by the survey. These innovative methods included stir frying, kippering, deep frying, barbecuing, and boiling. Two respondents made whale burgers, and one created whale sausage. Of the remaining respondents who did not receive whale meat for their personal consumption, 84.7% indicated that they would have liked meat from the 1999 whale.

Of the 75.3% of respondents who prepared blubber, 22.4% smoked it, 37.9% rendered the blubber into oil, 6.9% pickled it, 48.3% boiled it, and 65.5% ate the blubber raw. An additional 3.4% of respondents used the blubber for cosmetic purposes. Several interview respondents did indicate that rendering the blubber from the 1999 whale posed problems because of a low concentration of fat in the animal (Renker 2002).

Whale oil is a particularly important commodity for the Makah people, and its precious nature increases its value. The rich oil is used the way many people use olive oil. In the Makah example, many people flavor dried or plain food, such as fish, fish eggs, potatoes, or bread, by dipping these foods into the whale oil. This use is a traditional one, and is mentioned in the earliest ethnographies, such as Swan (1869) and Densmore (1939). In addition, whale oil may be used in particular ceremonial and ritual activities. In one example, when thrown onto a roaring fire in the middle of a longhouse, the whale oil causes the fire to blaze up in a most extraordinary manner; this effect looks the same to modern Makahs as it did to their ancestors, increasing the spiritual connection between past and present.

The Household Whaling Survey attests to the significance of the whale as a food resource because of the large number of respondents who want additional information about processing and preparation techniques for whale products. Of 163 respondents, 70.6% wanted more information about preparing whale meat, 52.1% wanted to know more about butchering whale, 60.1% wanted information about rendering oil, and 59.5% wanted to know about smoking meat.

Modern Makahs also have an interest in whale bone as a raw material. 75.5% of Makah households report that they would like to have access to whale bone on a regular basis, and some people were disappointed that the bones of the 1999 whale were not made available to the community for private use. Instead, the Makah Tribal Council made an arrangement with the Neah Bay High School which provided vocational opportunities for high school students. The entire skeleton of the 1999 whale was given to the high school so that students would learn to clean and prepare the bones for reassembly and eventual display at the Makah Cultural and Research Center. The National Marine Fisheries Service, The Burke Museum, and the Denver Museum of Natural History are all additional participants in this ongoing project (Monette: personal communication: 2002). To date, some 40 Makah high school students have learned valuable vocational skills through the skeletal assembly project. Faunal assembly skills are in

demand in museums and laboratories throughout the United States.

Most importantly, contemporary Makahs insist on the ceremonial rigor and discipline that was so important to their ancestors. 38.7% of respondents in the Household Whaling Survey report that they have actively participated in whaling ceremonial practices since the 1999 whale was harvested, and that 21.6% of their household members are also active ceremonial participants. These figures are meaningful, given the seventy year hiatus in whale hunting, as well as the secretive atmosphere which surrounds these activities. The serious attention given to the ceremonial preparation requirements also acts as an indicator of the positive impact that the whale hunt has had on the social and behavioral aspects of Makah life (Renker 2002).

For example, early ethnographies (Swan 1869, Densmore 1939) as well as recent depictions of pre-contact life (Parker-Pascua 1991) mention the practice followed by whalers' wives of "laying still" with their backs to the ocean while their husbands were hunting whale. By following this practice, wives would spiritually connect with the whale in the ocean, causing it to "be still" on the water, and to swim toward, rather than away, from shore. In the successful 1999 hunt, wives, partners, and mothers of the crew followed this ceremonial practice, and two of these women were brought onto Front Beach in the ritual manner when the whale was brought ashore. Men do practice ceremonial preparations like bathing, but as in pre-contact and historic times, their exact activities are kept highly secret.

A Diachronic Account of Makah Whaling

The Ozette archaeological literature, especially the work of Huelsbeck (1983, 1988, 1988a, 1988b), attests to the considerable time depth and continuity of the Makah whale hunt. Prior to contact with non-Indians, the Makahs and their **nu.ca.nu.**= relatives hunted whale successfully for at least 1200 years without destroying the resource. Ceremonial, social and cultural proscriptions established a functional balance between the Makahs and the whale populations which swam in or through Makah waters.

Once non-Indian traders and explorers entered the waters of the Pacific Northwest, Makah whale hunters felt the effects of an increasing demand for whale products. In response, Makahs continued to ply their well established trade in whale oil and whale products with the visitors.

The regularity and size of the gray whale migration attracted whalers from the United States and Europe. Like the Makahs, other non-Indian whale hunters appreciated the opportunity to practice offshore whaling in the area, as opposed to the more expensive, more protracted, multi-year ocean voyages. "As the market for whale oil and dogfish oil increased in the 1840s and 1850s, the Makah brought oil for sale...Oil purchased from the Indians was a major export of the Hudson's Bay Company" (Lane

1955:17). By 1852, Makahs were trading or selling some 20,000 gallons of whale and fish oil (Lane 1955:18); this figure would rise to 30,000 gallons per annum within 20 years (Gibbs 1877:175).

In 1854, Capt. Charles M. Scammon discovered the breeding grounds of the gray whale in the lagoons of Baja California and Mexico (Hagelund 1987:42-43); this discovery now provided the two terminal points for the gray whale trek, and helped to increase the exploitation of the gray whale on the American Pacific coast.

As time passed and contact with non-Indians increased, other entities intruded into Makah life, and by extension, into the whale hunting complex. Governor Stevens, assigned by the United States' government to negotiate a Treaty with the Makah in 1855, knew of the commercial value of Makah whale hunting talents when the Treaty of Neah Bay was signed. Indeed, numerous Makahs made speeches during the Treaty negotiations asking that the right to whale be reserved to them when the Treaty was signed. These Makah negotiators, and Gov. Stevens, agreed that Article IV. of the Treaty of Neah Bay would specifically list whaling, along with sealing and taking fish, as a right guaranteed to the Makah Tribe. Article IV. of the Treaty of Neah Bay makes Makahs unique among all United States' native tribes: Makahs are the only tribe whose right to hunt whales is recognized in a treaty with the government of the United States.

While the Treaty of Neah Bay preserved the Makah right to hunt whales and seals, and to fish in usual and accustomed grounds, other federal interactions with the Makah did not seem to support this language in actuality. Assistance sent to the Makahs contained agricultural tools, rather than items which supported any of the active components of the Makahs' maritime lifestyle. Instead of tools and materials which would help to procure, process or preserve whale, seal or fish products, Makahs received pitchforks, scythes, hoes, and sickles. "James Swan reported in 1862 that the Makahs had converted the tines of pitchforks into fishhooks, scythes into blubber knives, and sickles into arrowheads" (Marr 1987:29). The Makah reaction to the agricultural materials is perfectly understandable given their splendid maritime talents and the fact that Makah land was obviously unsuited to cultivation (Whitner 1977, Renker and Gunther 1990).

Rather, the motives of the United States are suspect. While soil studies may have been unsophisticated in the mid-nineteenth century in the Pacific Northwest, it took little effort to realize that the soil, vegetation, and topography of the coastal area was unlike the rich agricultural belts in other parts of the country, such as the Plains and the Northeast. Indeed, the land on the Makah reservation was clearly different from that of the Washington territory east of the Cascade Mountains.

This bizarre situation developed because of prevailing ideas regarding federal Indian policy; it had been developed with a very different perspective. The United States government did not

want to encourage self-sufficiency, because self-sufficiency often encouraged hunters and gatherers to travel beyond the confines of the established reservations, and to maintain cultural practices considered savage and barbarous. The best way to force a sedentary existence on a group of hunters and gatherers was to make the group dependent upon agriculture, which required a fixed resource base. The singular nature of this policy was also inappropriate for the Makahs, who already had a fixed, plentiful marine resource base and no land suitable for agriculture.

A philosophical mandate accompanied this strategy. "One of the convictions of those associated with the administration of Indian affairs, both officially and informally, was that farming was associated with civilization" (Whitner 1977:21). In the Makah case, Indian policy was designed "to change the Makahs from self-sufficient food gatherers to farmers, dependent on the white people for tools and instruction" (Marr 1987:29). Indian policy was also designed to assimilate Makah people through an educational system that ignored Makah priorities and prohibited the use of the language, in addition to eradicating customs considered heathen, savage, and dangerous (Colson 1953, Gillis 1974, Whitner 1977, Renker and Gunther 1990).

Whitner (1977) reports that Indian Agency personnel were somewhat daunted by the task of civilizing the Makahs, and cites Henry A Webster, the first resident Indian agent, as writing in 1866, "The Makah are probably nearer the normal state of savage wilderness than any other tribe in the Territory, and seem particularly averse to acquiring the habits and customs of the whites" (in Whitner 1977:20). Little progress is recorded in Webster's Annual Report for 1867, though he is staunch in his resolve to eradicate traditional values and practices:

> Their very natures must, however, be changed, and their habits forced, if necessary upon them, or they will retrograde into worse than savage supremacy of filth and disease of former days (ARCIA 1867).

In spite of the Treaty's recognition of whale hunting as an important facet of Makah life, the United States government chose not to support this well-developed practice. Lane (1974) discusses the frustration of several resident Indian agents who realized that federal efforts should be promoting marine activities, rather than agriculture. Some agents believed that assimilating Makahs to American values, customs, and practices would be easier if the government aided traditional marine pursuits.

Lane documents numerous requests for support of fishing activities from 1860-1881 from agents and superintendents. Regardless of the nature of these requests, Lane concludes that "the United States failed to provide the assistance repeatedly requested" (1974:20). Gillis (1974), Lane (1974), Whitner (1977), and Marr (1987) discuss the circumstances surrounding the federal government's promotion of a shift in Makah subsistence from a maritime base to an agricultural one.

In 1870, President Grant's annual message announced an Indian policy which sought to "Christianize and civilize the Indian" (Whitner 1977:18). At this same time, Pacific whale populations were diminishing, and the Makahs who continued to whale hunt had to make adjustments. Singh (1956) and Van Arsdell (1987) indicate that Makahs increased their seal hunting efforts to compensate for a less profitable whale hunt. "Beginning in 1886, Makah crews were hired on sloops and schooners to hunt fur seal off the Washington coast and Vancouver Island (Marr 1987:29). Makah fur seal hunters easily demonstrated their pelagic talents and Makahs quickly used financial profits and exceptional skill to their advantage. Colson (1953:159) reports that "several Makah sealers had their own schooners and were hiring White navigators in the 1890s".

These changes greatly affected traditional subsistence and trading practices. Swan (1884-1887, 2:396) and Waterman (1920:48) both express opinions that the success of Makah fur sealing had an impact on the whale hunt. "This work was so profitable that the Makah temporarily abandoned whale hunting" (Renker and Gunther 1990: 428). Other historians agree. "By 1891, sealing became so lucrative for the Makah and Westcoast native hunters that their traditional whaling expeditions virtually ceased" (Webb 1988:145). A friend of A.W. Smith lamented the decline of the whaling culture in a letter written on 29 November 1888, "Many of our old whalers at Neah Bay have died since we left" (AW Smith Papers).

While the Makah enjoyed the prosperity brought on by their pelagic success, the Pacific fur seal population was showing signs of stress by 1890. The population could not sustain itself in the face of an increasing number of sealers and the use of firearms. The Law of December 30, 1897, made fur sealing illegal; the agent for the Neah Bay agency, Samuel Morse, was directed to enforce this law on the Makah reservation (AW Smith Papers). Accordingly, Makahs would now be allowed to hunt fur seal only from canoes, using traditional gear and techniques. "Some returned to traditional whaling" (Renker and Gunther 1990:428), but the loss of cash from the commercial fur seal hunt created a huge vacuum on the reservation.

While whale hunts were "still the symbolic heart of the culture" (Marr 1987:25), they continued to diminish in frequency, and became less and less cost-effective. In addition, the introduction of American values worked against the traditional subsistence pursuit. For example, the American philosophy of

social equality made it difficult for Makahs to continue to staff and organize whaling canoes, and therefore households, according to the ancestral patterns. Whale hunting was no longer the sole avenue to a position of ceremonial and political importance as the headman of a large longhouse.

Epidemics, bans on ceremonial activities, and the federal schooling system also produced devastating effects on the Makah's ability to resume whale hunting after the fur sealing ban. The diseases that affected the Makah population had reduced the number of tribal members by some 75% by 1890 (Boyd 1990:145); much family-owned information was lost as a result. Makahs died without passing down important knowledge. Hancock describes the rapid and disastrous effects of the smallpox epidemic of 1853 in his journal. This epidemic was so severe, it literally wiped the village of **bi?id?a** from the face of the earth.

> It was truly shocking to witness the ravages of this disease here at Neaah (sic) Bay... In a few weeks from the introduction of the disease, hundreds of natives became victims to it, the beach for a distance of eight miles was literally strewn with the dead bodies of these people, presenting a most disgusting spectacle (182).

The extreme number of fatalities caused by the epidemics also disrupted the line of authority in most families. Cultural protocol dictated that ownership of ceremonial and economic rights and privileges had to be transmitted publicly at a potlatch. In many cases, epidemics took the lives of people who had not transmitted control over ceremonial and economic privileges to another person. In many other cases, knowledge of critical components of rituals and ceremonies was abruptly lost. The complicated social structure and ritual life which had existed prior to contact was severely disrupted by the decimation of the Makah population.

The governmental ban on traditional and ceremonial activities added to the social and cultural disruption. Potlatches were illegal by the 1870s (Marr 1987:50), forcing Makahs to move off the reservation or to inaccessible places to hold these important public events. Daniel Dorchester, Superintendent of the Indian Service wrote the following about Agent McGlinn, stationed on the Makah Reservation in 1890:

> This is one of the best officers I have seen in the Indian Service. He knows the Indians remarkably well, understands his business thoroughly, and sticks closely to it. He strictly enforces the regulations of the Department, is breaking up old Indian

> customs, marries the Indians in due forms and records the marriage, and is very strict against intemperance and licentiousness.
>
> The Indians are quite industrious in their way, though rather spasmodic in their labors. They have seasons for berrying, hunting and fishing, and are as dirty and squalid as all fish Indians are. They earn a great deal of money, but have a potlatch system, in which they give away a large amount of money and other articles in feasts... Agent McGlinn is breaking up this custom (ARCIA 1890).

Without the potlatch, the Makahs could not establish important proprietary rights regarding ownership of dances, songs, and other ceremonial and economic privileges. Public transmission of these and other important events for the oral history record could not take place, causing an additional level of social and cultural disruption.

Secret societies were also banned. These complex organizations carried important social functions prior to federal interference. Some secret societies were responsible for healing the sick, while others were important for maintaining social order and punishing transgressors (Ernst 1952). Regardless of the internal function that secret societies served for Makah society and culture, the federal government viewed these activities as savage and demoralizing (Whitner 1977, Marr 1987).

Dances and customs associated with secret societies and winter ceremonials fueled the federal opinion that boarding schools were the only way to eradicate ancestral practices which offended the American sense of morality and decorum. Agents realized that one way to assimilate Makahs and eradicate offensive rituals was to interrupt the transmission of ancestral information within what remained of Makah families. One way they achieved this objective was by separating Makah children from the influence of their family via the use of boarding school. Whitner (1977:28) quotes agent C.A. Huntington as writing, "If the purpose be to civilize these children of darkness, to take them from a barbarous life and put them into a civilized life, the more divorced from the house of their childhood the better".

The United States' policy of assimilation through education increased the socio-cultural confusion. In their attempts to "Kill the Indian but save the man", white educators forced Makah children to leave their families, abandon the Makah language, and adopt white ways of eating, dress, worship, and behavior. Many Makahs who underwent this cultural indoctrination began to feel that traditional activities and beliefs were barbaric, and worked to make their lives more like the non-Indian teachers and

administrators who promised modern education, health care and facilities.

In addition to these internal socio-cultural factors, other factors prevented whale hunting from returning to its former prominence. The gray and humpback whale populations were being seriously depleted by non-Makah hunting practices. The population of gray whales was reduced by non-Makah commercial hunters, making offshore hunting in canoes more difficult. Since the Makah style of offshore whaling relied on the ability of land-based lookouts to spot whales which swam close to shore, a lack of these whales effectively decreased the viability of the Makah whale hunt. Only three recorded whale hunts took place during 1905 (AW Smith Papers).

Men could no longer rest assured that the whales would be plentiful, and that canoes at the ready would be called to a hunt by a lookout. In addition, the intensive investment required by a whaler and his crew had not changed; men still had to invest enormous amounts of time in ritual preparation as well as in the care and maintenance of the whaling canoe and other associated gear. Without the plentiful supply of whales which had always graced Makah territory, this intensive investment became too difficult to justify.

So, men turned to a more productive venture that would still make use of the navigation and seafaring skills that both whale and seal hunters needed and used. Fishing had become a more cost effective venture than whaling prior to the turn of the last century.

> The Makahs catch a great many fish, which they ship three times a week to Seattle, where they have a good market for them. They have caught and shipped as high as 10,000 pounds of halibut in one day (ARCIA 1889).

However, offshore whaling in motorized boats was still of interest to American, Canadian, European and Asian parties. As late as 1909, a Seattle based company was considering the establishment of a commercial whaling station at Neah Bay (Webb 1988:177). Plans for the Neah Bay station were eventually abandoned.

After more than a thousand years as whale hunters, Makahs found themselves in a social, ecological and political climate that no longer favored this pursuit. The combined effects of massive epidemics, boarding schools, and government acculturation policies had drastically changed the delicate and complex social dynamic which had supported the traditional Makah whale hunt. The astounding success, then eradication, of the Makah commercial fur seal hunt contributed to this disruption as well. When these two factors are juxtaposed with severely diminishing gray

and humpback populations, even subsistence whale hunts became a risky investment. The investment in the Makah whale hunt became even riskier as more Makahs shifted toward the very successful subsistence and commercial venture of ocean fishing.

In spite of these factors, the Makah desire to reinvigorate the whaling tradition never dissipated. Families passed on whaling stories, traditions, and secrets from generation to generation. Whaling designs and crests still decorated public buildings and private homes. Accounts of Makah whalers were read again and again. Whaling displays in the Makah Cultural and Research Center and other museums kept visual scenes in the heads and hearts of Makah people. By 1994, the gray whale population had bounded back to healthy levels; the people in Neah Bay eagerly awaited the opportunity to hunt gray whales again.

THE QUOTA PERIOD

The Makah Tribe has been preparing for this revitalization for decades. Makah people never stopped educating their children about their respective familial whaling traditions. Makah children in the public school on the reservation experienced whaling curriculum every year as a part of the standard school curriculum, as well as through special cultural and linguistic initiatives sponsored by the school district, the Tribe, or any one of a number of funding sources. In fact, collaborative educational efforts through the Makah Cultural and Research Center, the Bilingual program of the Neah Bay School, and other private efforts, have provided whaling curriculum in the schools since the 1960s, with continuous efforts since 1981. While non-Makahs perceived a large temporal gap in the whaling history of the Tribe, tribal members see continuity. Many individuals were patiently waiting for the whaling traditions to be taken from storage and implemented in reality.

The Makah Tribe already has a history of successfully reviving cultural traditions. In the last two decades, the Makah Tribe has reinstituted numerous song, dance, and artistic traditions, and operated a program to restore the Makah language to spoken proficiency on the reservation. These positive accomplishments are due to the enthusiasm, dedication, and knowledge of Makah people, and to the creation of the Makah Cultural and Research Center; this institution manages the cultural resources of the Makah Nation through research, documentation, exhibition and education.

The Makah Tribe created The Makah Cultural and Research Center (MCRC) in response to the massive archaeological collection generated by the Ozette excavation. While the original intent was to create a museum to house the artifacts from the pre-contact levels at Ozette, community opinions shaped the MCRC into a research and education complex that contains numerous exhibition galleries, a language restoration project, archival programs, and a series of educational and interpretive services (Renker and Arnold 1988).

The MCRC has been instrumental in the revival of many Makah traditions. The facility has acted to centralize and incorporate the resources of Tribal government, the Makah community, and other private and public sources to manage Makah cultural resources; many of the resources and traditions that were threatened prior to the creation of the MCRC are now healthy and growing. Consequently, the Makah Tribe had a successful record of bringing ancestral traditions from a dormant state into the active present. The Tribe was confident that the resumption of whaling would be a success, and was not daunted by critics who believed that this tradition could not be reinstated.

On May 17, 1999, the Makah Tribe celebrated a pivotal moment in its long history. At 6:54am, the Creator allowed a Makah crew to realize a collective dream that the Makah Nation had stored in its minds and hearts for seventy long years: they brought a whale home to the Tribe. This pivotal cultural event riveted the attention of the Makah community, and energized Makah Tribal members who believed in, and worked toward, the restoration of this significant cultural practice.

Survey data indicate that some 1200 Makahs watched the climactic moment of the successful hunt on live television. Hundreds of Makahs traveled home to the reservation as soon as they could, wanting to be a part of this significant event. Later that day, some 1400 Makahs welcomed the whale to Front Beach in Neah Bay, and paid honor to the great creature. Many Makahs ate raw blubber right on the spot, and then began the task of preparing the food and resources that the whale contributed to the Makah people.

Butchering the whale proved a huge task for the Makah people. Lack of familiarity with gray whale anatomy, tools which were not well adapted for gray whale meat and blubber, and logistical issues presented immediate obstacles for the butchering process which began on Front Beach. Some confusion also centered on whale parts other than meat and blubber. Most importantly, Makah were able to overcome these problems and continue with the job of processing the whale.

In a matter of hours, a flatbed truck had taken what was left of the whale and driven to the Makah Tribe's fish plant, a processing plant with 800 cubic feet of freezer space and a service entrance large enough to allow the flatbed to drive inside. Within twenty-four hours, Front Beach showed no sign of the momentous event which had happened the previous day. The Makah butchering crew, which included Makahs who had travelled to Alaska to learn processing techniques, had some assistance from a Native Alaskan. Many people worked to butcher the parts of the whale which had not been distributed to Tribal members on the night of 17 May. In addition to meat and blubber, Makahs interviewed during the Makah Household Survey reported requesting and receiving whale lice, sinew, baleen, brain, and heart. Other Makahs reported that they would have liked to receive liver.

cheeks, eyes, and intestines. Some of these items, like whale lice and baleen, are primarily used for ceremonial reasons, while others, can be used in tool production or as food. The bulk of the food products derived from the whale were reserved for the Tribe's celebratory feast, which was to be held on 22 May.

In private homes, people welcomed whale meat, blubber, and other whale parts. Between 17 May and 22 May, some households began to use recipes held in family confidence for decades, and others experimented with techniques used for other sea creatures, like seals and fish. Some 62.9% of Makah households received meat from this whale; 48.4% received blubber. A majority of households which did not receive meat or blubber from this whale reported that they would have welcomed whale products into their homes (Renker 2002).

On 22 May 1999, the Makah Tribe paid tribute to the whale which provided so much to the Tribe, and celebrated a new chapter in its cultural history. Thousands of people attended the parade held during the day, and the feast held in the high school gymnasium later that afternoon. In addition to the local Makahs who attended these events, many Makahs journeyed home to participate.

Unfortunately, this has been the only successful hunt during the quota period. Restrictions on the areas in which Makahs could hunt gray whales, as well as limits on when the hunt could take place hampered efforts to take additional whales as provided by the quota. Further constraints arose from a lawsuit which resulted from a complaint filed in 1997 October. This domestic legal issue halted all Makah whaling for the latter half of 2000 and all of 2001.

Lawsuits were not the only problem that faced the Makah Tribe during this quota period. Four Tribal members alleged that the majority of Makahs were not in favor of the resumption of whaling, and that the Makah Tribal Council had misrepresented the opinion of its people. Fueled by these rumors, anti-whaling advocates staged numerous demonstrations on and off the reservation, and garnered attention from the print and visual media. These efforts also limited the success of the Makah hunt by blocking canoes, scaring whales, and threatening Makah whalers. During the 1999 whaling season, many television spots and published reports contained inaccurate or partially correct information, and included quotes from the anti-whaling Makahs who insisted that the majority of Tribal members did not want the Tribe to hunt whales. These people also accused Makahs of wasting whale products, claiming that tribal members did not like, nor consume whale products. Detractors pointed to alleged wasted meat and blubber from a 1995 whale which was incidentally caught in a fishing net.

Despite these obstacles, more and more Makah men trained to be whale hunters. During the last hunting season prior to the 9 June 2000 court decision, several family-based whaling crews were

preparing to hunt, and two family-based crews were granted a total of three permits to go hunting by the local management organization. While no crew brought a whale back to the village, the social benefits of each crew's diligent preparations positively affected dozens of families.

The Makah Reservation in 2002

The contemporary Makah Tribe lives on a 27,151 acre reservation which dominates the northwestern corner of the Olympic Peninsula of Washington State. Other reservation properties include two offshore islands, Tatoosh and Waadah, and a 719 acre parcel of land surrounding the Ozette village site. In addition to these land areas, Makah traditional cultural properties include water territories, like fishing banks, as well (Renker and Pascua 1989). At the time of the Treaty of Neah Bay, Makah traditional cultural properties extended to fishing banks and other ocean grounds as much as 100 miles offshore into the Pacific Ocean. To the north, Makah fisherman accessed rich fishing grounds which are now in Canadian waters, such as Swiftshore and 40-Mile Bank. To the east, Makahs considered the the Strait of Juan de Fuca to be at their disposal to Port Crescent. To the south, Makahs utilized the waters off of Cape Johnson, called **xacic'u?a**. "deep hole". (Swindell 1941, Renker and Pascua 1989).

In 1855, the Tribe signed the Treaty of Neah Bay, which established the boundaries of the reservation but did not recognize the multiple village system. Men negotiating for the Tribe discussed the Makah relationship with the ocean; the Tribe considered the ocean to be territory more important than land. **c'aqa.wi7**, one of these Makah chiefs, articulated this point. "I want the sea. That is my country" (Gibbs 1855). The Indian Claims Commission estimates that "seventy-five to ninety percent of the Tribe's subsistence in 1855 came from the sea rather than land based-mammals or vegetation" (Makah Indian Tribe v. United States, 23 Ind. Cl. Comm. 165, 174 (1970).

Subsequent expansion of the reservation boundaries to include villages other than Neah Bay occurred in 1872 and 1873 via three Executive Orders issued by the United States' government. The village of Ozette was not added to the reservation. Rather, another Executive Order in 1893 created a separate Ozette Reservation to accommodate 64 Makahs who refused to move to Neah Bay (Renker 1994). Today, the Makah Tribal Council is the official governing body of both the Makah Reservation and the Ozette Reservation; the United States Congress ratified the Makah Constitution in 1937 after the Tribe voted to accept the terms of the Indian Reorganization Act in 1936 (Renker 1994).

The Makah Tribe calls itself **q*idicca?a.tx**, "The People Who Live Near the Rocks and the Seagulls". The name Makah is an English version of the term used by a neighboring Tribe for the Makahs. United States' year 2000 census data indicate that there are 1,356 Makahs living in 471 households on the current

reservation. Another 1,117 Makahs live away from the reservation (Makah Planning Office 2002). Most reservation residents live in the reservation's single centralized village, Neah Bay, location of the public school, the post office, the general store, the health clinic, and other amenities. While Neah Bay is certainly the hub of reservation activity, a growing population and a housing shortage have encouraged Tribal members to live in more remote reservation locations. Two popular settlements outside Neah Bay are at the sites of former ancestral villages, such as **wa?ac'** (Why-atch) and **c'u.yas** (Tsoo-yess).

Like other locations on the Olympic Peninsula, economic conditions on the reservation have steadily declined since 1989. The Pacific salmon crisis and controversies surrounding timber practices in the area have increased the economic pressure on the reservation population. In addition, the 1989 deactivation of the United States' Air Force Base operating on the Makah Reservation created an employment crisis for the Makah community. Approximately 200 jobs left the reservation when the base closed, and plans to develop a new job source have not yet proved fruitful. In addition, fluctuations in the reservation's natural resources, commercial fishing, tourism, and sport fishing have impaired the Tribe's ability to ensure reliable incomes and subsistence sources for its members. The average unemployment rate on the reservation is approximately 51%, and fluctuates seasonally; almost 49% of reservation households have incomes classified below the federal poverty level, and 59% of the housing units are considered to be substandard (Makah Planning Office 1992). The average household income on the reservation is approximately $5,000.00, compared with approximately $40,000.00 in the rest of the state of Washington (Income 2000, US Census Bureau).

Fishing variations have had an especially drastic effect on Makah families. 95.2% of Makah households have someone in the residence who fishes; 62.8% of these households consider fishing to be the major occupation in the home (Renker 1988). While the decrease in the cash economy of the reservation is a clear result in years of diminished commercial fishing, there is a more insidious affect on the subsistence level.

Ocean fishing has replaced whale hunting as the backbone of Makah household economy. In addition to the cash that fishing generates, another level of economy operates, that of traditional reciprocal systems. Even households without a fisherman derive food, money or other goods from a fisherman who is a relative or a friend. Fish is a medium of exchange on the Makah reservation, and is also an indicator of a fisherman's regard for the individual to whom the fish is given. Indeed, people on the reservation rely on the Makah fleet for substantial contributions to community meals and community functions.

100% of the Makah households on the reservation engage in some kind of reciprocal networks which involve fish at some level of exchange: 80.4% of households receive fish from someone who

fishes; 85.3% of households give fish to other family members, friends and community meals; 84.1% of households who smoke fish give it to other family members, friends and community meals; and 35.3% of households receive goods or money from a fisherman when the season is successful (Renker 1988:8).

The 1988 Makah Household Fishing Survey also uncovered another pattern of interest in the Makah community. Over 50% of the reservation households used traditional Makah foods at least once a week; these foods included items like fermented salmon eggs, smoked fish heads and backbones, halibut cheeks and gills, and dried fish (8). 40.2% of Makah households eat fish a few times each week, and 66.7% eat fish at least once each week. These data demonstrate the community's preference for and reliance upon traditional, local, marine foods which are often not favored by the dominant American population.

Recent research available in Aradanas (2001) demonstrates the tenacity of the 1988 subsistence profile. The Makah reliance on seafood products continues to be derived from subsistence traditions, and the existence of redistributive and reciprocal networks remains strong. One striking datum compares the amount of fish consumed in Makah households with that of the average American household. The annual per capita consumption of fin fish and shellfish for the average Makah is a staggering 126 pounds, some eight times the consumption rate for the average American. While fish comprises 55% of the Makah diet, it represents only 7% of the diet of the average American (84).

Recent regulatory and ecological circumstances have had an impact on Makah marine subsistence practices. New, stringent restrictions on salmon fishing, and the yearly fluctuations in fishing quotas, restrict the ability of Makah fisherman to generate a reliable surplus for distribution. This situation has affected many households which rely on surplus fish to meet subsistence needs.

Additional ecological circumstances periodically caused by red tides and oil spills have negatively affected subsistence households which rely on shellfish resources. These events have reduced the ability of Makahs to utilize the shellfish resource as effectively as in the past. Financial compensation awarded to Tribal members as a settlement for the destruction of subsistence shellfish during one of these oil spills can not restore the health of the ecosystem.

Still other factors are affecting subsistence issues pertinent to the Makah Tribe. The Makah Tribe, like many other governmental agencies, cut its operating budget by some 10%* for the 2002 operating year. Cutbacks in food and financial support from public assistance programs affects families which are already economically stressed.

Teen age pregnancies, high school drop outs, substance abuse problems, and an increasing juvenile crime rate indicate that the

Makah community is one still in flux: the enormous social disruption caused by epidemics, boarding schools, and federal policy is still not over. Entire social, cultural, subsistence, and ceremonial institutions were either repressed, eradicated or decimated, and no structural equivalent was substituted. Continuation of the Makah whale hunt would provide the Makah Tribe with a reliable mechanism to repair the damage done to the social infrastructure during the years of forced assimilation. Additional whale hunts would certainly bring important subsistence benefits, as well as other important social considerations.

The Household Whaling Survey (HWS)

As the end of 2001 drew near, the Makah Tribal Council began preparing to submit a request for a new gray whale quota. The Makah Tribal Council wanted to address the concerns of citizens who insisted that Makahs did not support whaling, and that whale products were being frivolously wasted. Clarifying and quantifying the sentiments of enrolled Tribal members was extremely important, so the Makah Tribal Council commissioned a household survey in December 2001. This survey, The Household Whaling Survey (Renker 2002) asked Makahs to report their opinions about the whale hunt, as well as levels of participation in whaling-related activities, including the preparation and consumption of whale products. A copy of the instrument is included in Appendix 2.

Results from the Household Whaling Survey (HWC) were interesting and conclusive. The survey interviewed 34.6% of the Makah households on the reservation. 49.7% of the respondents were male; 50.3% of the respondents were female. 100% of the respondents considered themselves active members of the reservation community, attending a variety of community events, both cultural and otherwise.

The 163 respondents reported information about a population of an additional 268 household members.

Of the 163 respondents, 93.3% believed that the Makah Tribe should continue to hunt whale, 5.5% believed that the Makah Tribe should not hunt whale, and 1.2% were undecided. Clearly, a randomly selected, significant percentage of respondents were supportive of the Makah Tribe's decision to pursue the Treaty Right of hunting a whale that is no longer on the Endangered Species List. It is also interesting to note that three of the respondents who do not want the Makah Tribe to hunt whale do want whale products, like meat, bone, and/or blubber.

When asked to state a reason for this belief, respondents provided a wide variety of opinions. (Because multiple responses were allowed for this question, the positive percentage is based on the number of respondents who answered positively, R= 152.) Of the respondents who felt that the Makah Tribe should continue to hunt whale, 46.1% cited the Treaty Rights as the reason, 35.5%

noted that food, better nutrition, or a traditional diet was the reason, and 36.2% felt that maintaining or restoring some aspect of cultural heritage or tradition was the most important reason. 20.4% indicated that moral or spiritual benefits, such as changed lifestyle, better discipline, or increased pride , should prompt the Makah Tribe to continue to whale.

Respondents also provided a variety of multiple responses to the question, "Do you think whale hunting has been a positive thing for the Tribe?". The most popular response was given by 51.6% of the respondents, who indicated a change for the better in morals or social values: pride, self-esteem, changing lifestyles, abstaining from drugs and alcohol, better male responsibility, and positive role models for youth. 43.8% of respondents considered uniting the Makah Tribe, and other Tribes, as the most positive aspect of whale hunting. Respecting Treaty Rights garnered a response from 25.5% of the respondents, while maintaining or restoring cultural traditions was the reason provided by 32.7% of the respondents.

A surprising number of individuals reported that they were involved in whaling-related activities since the 1999 whale was caught. 38.7% of respondents indicated that they have participated in whaling ceremonial activities, 30.1% have cooked whale, and a resounding 81% reported eating whale products. Respondents related that 70.9% of the household members included in the study ate whale products, and that 21.6% participated in whaling ceremonial activities.

Another significant result that demonstrates overwhelming community support for the Makah whale hunt is found in the question (#45) which asks respondents to indicate subjects about which they would like more information. The majority of respondents wanted information about preparing whale products, and cleaning and carving whale bone. This question also elicited a response that was not planned. 25% of respondents indicated that they would like to share family recipes and techniques for preparing whale meat, rendering oil, and butchering whale. Given the history of secret, family information regarding whale related issues in the Makah Tribe, the fact that respondents volunteered to provide knowledge of practices, techniques, and recipes is a testament to the community's support for the continued use of whale products.

Community support for, and interest in, the Makah whale hunt is also shown by reports of participation in the actual events surrounding the successful 1999 hunt. Of the 163 respondents, 78.5% were watching live television when the whale was taken, as were 67.2% of the respondents' household members. 81.6% of the 163 respondents were present at Front Beach in Neah Bay when the whale was brought ashore, as were 87.6% of the household members. Numerous respondents who did not attend either of these events qualified their response by telling the surveyor that they had to work or were out of town, and would have attended had they been in Neah Bay.

Sixty-four respondents reported that a total of 226 non-resident Makahs billeted in their respective homes from 17 May to 22 May 1999. This datum indicates that Makah support for the whale hunt is not restricted to reservation residents. The Makahs who traveled home to the reservation felt the need to be on ancestral territory, with relatives and friends, and be a witness to the crucial events surrounding the successful whale hunt.
80.4% of the 153 respondents reported attending the Makah Tribe's celebration in honor of the first successful whale hunt in seventy years. 78.6% of these respondents attended the parade early in the day on 22 May, and 95.4% attended the feast later that afternoon. These respondents indicated that 180 (67.2%) of their household members went to the parade, and 191 (71.3%) joined the crowds at the dinner. Levels of participation like those reported here suggest the pride and happiness felt by Makahs who were observing more than the successful hunt; they were celebrating the validation of the traditions and priorities established by ancestors and secured by the signers of the Treaty of 1855.

III. WHALE HUNTING AND THE MAKAH TRIBE: THE NUTRITION COMPONENT

Prior to contact with Europeans, the Makah people used a wide variety of foods. Because of their location on the tip of the Olympic Peninsula, the Tribe was able to exploit land and sea animals, including elk, deer, bear, seal, and a diverse population of fish, shellfish, and other maritime species. In spite of this abundance, "whale meat and oil were among their principal foods" (Densmore 1939:13). Not only were these foods of high status, their role in the nutrition and ceremony of the Makah people cannot be underestimated.

Huelsbeck (1988a:1) estimates that the amount of whale meat, blubber, and oil represented in the faunal assemblage at Ozette indicates that a significant percentage of the food at Ozette could have come from cetaceans. Whale meat was prone to spoil easily, especially when the process of towing a dead animal home took several days. This tendency reduced its importance in the precontact and early historic diet. About 10% of the food Makah people derived from whales can be attributed to meat (1988a:10). Oil however, was not subject to spoilage, and could be kept indefinitely as long as it was rendered properly (Swan 1869).

This important food product was recovered from natural pockets of oil within individual whales, as well as extracted from whale bones and rendered from blubber. Ommanney (1971:55) estimates that some 50% of whale bone weight could be reduced to oil. Faunal remains from Ozette indicate that bones were hacked and gouged to allow oil to both drip from the bones and to be recovered through boiling (Fiskin 1980). Blubber was primarily used as a vehicle to recover oil. Approximately 65% of the weight of blubber is reduced to oil through a rendering process (Huelsbeck 1988a:9).

Oil was an important nutritional item for a variety of reasons. Elders report that whale oil was used as a dip with a variety of foods, including dried fish and herring eggs, as well as potatoes in historic times. Swan(1869) and Densmore(1939) corroborate these accounts. Since dried fish and herring eggs had been processed to remove all natural oils in order to contribute to their longevity, the addition of whale oil added taste as well as nutrients to the precontact and historic Makah diet.

Oil was also the only nutritional product which figured prominently in the ceremonial life of the Makah people. An oil potlatch, given when a whaler had an abundance of oil, demonstrated his generosity with this commodity, and was a rare and special occurrence. Whale oil was the only edible item which could be the focus of a special potlatch, complete with particularized songs and other ceremonial items (Densmore 1939).

While blubber's importance in both precontact and early historic

times was clearly as a precursor to oil, "blubber was also eaten, usually cured first" (Densmore 1939:14). It was most popular when broiled next to a fire, and was the standard pacifier for babies, according to oral and ethnographic accounts.

For approximately 2,000 years, the Makah people relied on the nutritional products of the whale, and evolved as a biological population within this context. Archaeological data confirm the fact that Makah people were using whale as a food resource for some 750 years before the technique of hunting whale was developed (Wessen 1990). Faunal remains from a number of sites indicate that Makahs were butchering stranded or drift whales long before the technology to hunt the creatures evolved.

When circumstances prevented the procurement of whale products for subsistence, Makahs compensated by increasing their reliance on other subsistence foods. In spite of the changes that have affected the Makah people, subsistences foods are still an important part of reservation life. Makah hunters still procure land game like elk, deer, and bear to fill winter freezers and reduce cash expenditures. The resources of the sea and the intertidal zones are an important food source (Renker 1988), despite the decreasing abundance described previously.

Recent investigations focusing on the subsistence practices of the Makah Tribe in forest areas (Renker 1994) and the intertidal zone (1993) detailed a viable and thriving culture. Elders described the subsistence philosophy of the Makah people, and stressed the importance of teaching these values to younger people. Younger Makahs participating in these studies were familiar with these teachings, and practiced these subsistence rules when hunting or gathering food.

The most important subsistence strategy to the Makah people is the axiom, "Take only what you need." Makah elders emphasize this principle when the discussion centers on any type of hunting, gathering, or fishing activity (Renker 1993:14). Other common subsistence rules include: 1)choosing the procurement area so that the available biomass is not adversely affected by the amount one needs to harvest, 2) choosing the procurement area that limits the need to travel, and 3) choosing the food to hunt or gather based on the seasons of the food in question; one tries to avoid disturbing reproductive cycles, for example. The continuity of these subsistence practices and values reinforces the social and cultural integrity of the Makah people, and constantly reminds Tribal members of their intimate, and long standing, relationship with the environment.

These subsistence foods and practices are very important when considering the nutritional needs of contemporary Makah people. Modern research concentrating on the nutritional needs of an anthropologically defined population emphasizes " the interactions of genetics, physiological processes, population characteristics, and a wide variety of nutrition-related diseases" (Pelto 1989:x). Using these criteria, a discussion of

the profile of the Makah community yields interesting results when the focus is the use of the whale as food.

Consider the following. American Indian people are generally considered to be one of the most unhealthy populations living within the United States of America; this observation is especially true for natives living within the confines of a reservation. The infant mortality and life expectancy rate for reservation residents is the lowest of all American citizens (IHS 1995).

The diminished life expectancy on American Indian reservations is compounded by the fact that certain systemic illnesses linked to food and nutrition appear in statistically higher percentages among these populations. Diabetes, for example, is 234% more prevalent among American Indian people than in all other U.S. races (Indian Health Service 1995: 5). As a matter of fact, "American Indians have the highest rates of diabetes in the world" (NIH 1996:26).

A statistic of this magnitude is especially intriguing when one considers the nutritional history of indigenous American Tribes, and their respective divergence from the food traditions which mark western populations. Prior to contact with Europeans, North American Tribal people consumed foods which were native to their respective environments. Natives of the Great Plains and the Pacific Northwest were hunters and gatherers who utilized the plant and animal species which lived in and migrated through their territories. Natives of the Southwest and the Northeast augmented nature's bounty by cultivating crops, most of which were not available in Europe. (It is interesting to note that Makah people did not utilize plant foods to a great degree (Gill 1983), and still experience many digestive problems with diets high in fiber and cruciferous vegetables (IHS 1991).)

When traditional Tribal life was disrupted by contact with non-Natives, food traditions were some of the first to be affected. By the time the Treaties called for the forced placement of Tribal people on reservations in the 1850s, very few Tribes could still practice the subsistence patterns which had sustained their ancestors.

Hunting and gathering tribes were restricted because their ability to utilize former usual and accustomed resource areas was diminished; the reservation system made it possible for non-Native populations to acquire and control lands and waters once available to Tribes. Through Treaties, agricultural tribes lost valuable land capable of cultivation to non-Indian farmers, and were given less productive reservation land as compensation. Additional stresses on native food traditions appeared when the American westward expansion and growing commercial interests decimated food animals once plentiful before contact.

No matter what the individual Tribal food tradition, professionals in the health and social science fields appear to

agree that the introduction of western foods like refined sugar and flour, beef, and lard have had a dramatic negative effect on the health of American Tribal members in general. Many of these foods were distributed to reservation natives by the American government in the form of annuities and supplies. Specific studies have directly linked the introduction of western foods into the diet of Tribal entities to a variety of health problems (Hildes 1966:501, Keenleyside 1990:13, NIH 1996, and others).

American health organizations such as The National Institutes of Health (NIH), the National Institute of Diabetes and Digestive and Kidney Diseases, the Public Health Service, and the Department of Health and Human Services, are conducting research to try to determine why American Indian populations are subject to food related illnesses at a rate so much greater than the rest of the population. In many cases, reservation residents contract these illnesses at about half the age of Caucasians, according to the Indian Health Service (1995).

Many current studies are now investigating the link between genetics and the acquisition of nutrition related illness. The most important of these studies focuses on the Pima Indians of Arizona, a group with a food tradition dating back some 2,000 years; their traditional diet and lifestyle were disrupted about 200 years ago, causing major social and nutritional changes. The high rates of diabetes and obesity in this Tribe prompted the National Institutes of Health and several other American health organizations to undertake a long-term study of this population.

Thirty years of concerted studies with the Pima people have demonstrated results applicable to other Tribal people in North America, including the Makah. Research indicates that discrete populations evolve a genetic code that is uniquely suited to a particular environment and its food resources. This genetic code regulates the biochemical processes in the body that produce enzymes, proteins, fatty acids, and thousands of other chemicals which function within the human body. Scientists developing the genetic map for the Pima people have already identified a number of genetic variations within this community that are different from those in the white population (NIH 1996:6). These variations may explain why Pima people eating western foods are more prone to develop diabetes, obesity, and the long-term consequences of these health problems than other populations.

Like the Pima people, Makahs found their traditional pattern of food use interrupted by western contact about 200 years ago. The traditional diet rich in fish and sea mammal oils was gradually replaced by a western diet which considered beef, dairy products, and cereals to be the most nutritious. The whale products which once comprised a principal part of the diet were no longer available, and the whale oil which supplemented the preserved foods of the winter season was replaced by butter and margarine. A high proportion of lactose intolerance became apparent in the

Makah community, a fact not surprising for a population with no previous historic or cultural link to cattle or dairy animals (NIH 1996).

Given this perspective, certain IHS data become especially intriguing. For example, Indian people of the Northwest Coast have the highest rate of digestive illnesses of all American Indian people. Such illnesses comprise the leading cause of hospitalization for native people in this area. For northwest people, 16.5 % of all hospitalizations pertained to digestive diseases, compared to the next highest rate of 12.3% for Navajo people (Indian Health Service 1995). And, in terms of overall nutritional health, Makah and northwest people are at a potential genetic disadvantage because these populations evolved without a reliance on high fiber, low fat foods, like the Pimas.

Consequently, the reintroduction of whale products, especially whale oil, may produce dramatic results in the health of the Makah people. Current research in the importance and application of Essential Fatty Acids (EFAs), such as those found in sea mammals and fish oils, support the contention that the inclusion of whale oil in the Makah diet may have crucial implications for the health of the Makah community. This fact is not as surprising as it may seem when one considers the historic western use of products like cod liver oil as an important nutritional supplement.

For example, the Washington Office of the Superintendent of Public Instruction (OSPI) details the fact that Makah children attending public school on the reservation exhibit Attention Deficit Disorder (ADD), Attention Deficit Hyperactivity Disorder (ADHD), reading disabilities, and dyslexia at a rate almost twice that of the rest of the population (1996). Clinical studies which focused on the correlation between EFAs and these conditions report that children receiving supplemental EFAs demonstrate significant improvement in the ability to pay attention and read effectively (Stevens, Zentall, et al:1995; Stordy:1995).

In addition, marine EFAs have been clinically demonstrated to improve conditions like rheumatoid arthritis (Belch, Amsell, Madho, Dowd, and Sturrock:1988) and diabetic neuropathy (Keen, Payan, Walker,et al:1993). Both conditions are prevalent in the Makah community and especially within descendants of whaling families.

Whale oil and whale products may be the answer to these problems within the Makah community, and may provide researchers with an analogous study situation to that within the Pima community. Marine fish like salmon are becoming more scare within Makah households due to increasingly stringent quotas which disrupt traditional systems of reciprocity (Renker 1988). Consequently, access to whale products could provide Makahs with a nutritional remedy to many community health problems.

Access to whale products can provide the Makah community with important nutritional opportunities that carry implications for non-Makahs. Like their Pima counterparts, Makahs may be able to augment knowledge about the relationship between genetic patterns, nutrition, and health, especially in the area of EFAs. Community members are ready to rise to this challenge and re-learn the techniques necessary to make the food from the whale a part of Makah life again.

This section is not intended to imply that we can scientifically elucidate the nutritional advantages of whale products, especially oil, for the Makah Tribe. However, recent national studies provide some points of interest. Investigations of local populations with a demonstrable time depth indicate that regional genetic factors evolve in order to maximize the dynamic relationship between certain foods and the patterns in which these foods are consumed by subsistence populations. Consequently, it is reasonable to assume that increasing the consumption of locally available foods consumed through the millenia could confer substantial health benefits.

Such is the case for whale products and the Makah Tribe. The food products of the gray whale have sustained the Makah people for over 2,000 years; the Tribe has been less culturally and physically healthy since this access was restricted seventy years ago. A restoration of the ability to hunt the gray whale will provide the Makah Tribe with a key element of its culture that has been able to exist only in the flickering images of oral history for seven decades. The social fabric of the community will be able to patch its thin areas once the hunt is restored, and the physical health of the Makahs will increase once there is enough whale meat and oil to feed its children.

In addition, the addition of whale products will help to replace other subsistence resources which are in decline. As fish and shellfish quantities decrease on the reservation, the availability of whale products will prevent people from having to spend precious cash to replace current subsistence foods.

The resumption of the whale hunt will provide more than subsistence foods for the body. It will provide spiritual subsistence to the soul of the Makah people.

APPENDIX 1

MAKAH ALPHABET

The Makah alphabet variation used in this document is a function of printer and software limitations. The Makah alphabet is a variation of the International Phonetic Alphabet, and is presented in Renker (1987). No capital letters are used in this alphabet.

The following substitutions are used:

= IS EQUIVALENT TO A BARRED L

7 IS EQUIVALENT TO A BARRED LAMBDA

* IS EQUIVALENT TO A RAISED W

' IS EQUIVALENT TO A GLOTTAL MARK

? IS EQUIVALENT TO A GLOTTAL STOP

. IS EQUIVALENT TO A LENGTH MARKER

APPENDIX 2

CONFIDENTIAL HOUSEHOLD WHALING SURVEY

This survey is commissioned and sanctioned by the Makah Tribal Council, and is being administered by the Makah Cultural and Research Center. The data from this survey will be used in creating the new Needs Statement. This document will be a part of the United States' request to provide the Makah Tribe with another five year quota to hunt gray whales; the request is made to the International Whaling Commission.

Your name and the information you provide are strictly confidential. No information you provide will be linked directly to you in the Needs Statement. In fact, the author of the Needs Statement will not even know who has answered these surveys.

The completed surveys will be sealed and placed in the Archives of the Makah Cultural and Research Center. Access to these documents will be restricted by the Makah Tribal Council.

The respondent for this survey must be a Makah who is 21 years of age or more. For the purposes of this survey, a household member is considered to be any person that is residing in your house at the time of this interview. This survey is interested in the Makah members of your household.

ABOUT YOU AND YOUR MAKAH HOUSEHOLD MEMBERS...

1. Are you Makah? Yes _____ No _____

   Age _____ Gender _____

2. Do you have any Makahs living in your household? Yes _____ No____

   How many?_____

   If yes, complete 2a. If no, skip to 3.

2a. List all Makahs by relationship, gender, and age.

3. Where were you born? _____

4. Do you attend Neah Bay village events? Yes _____ No_____

4a. If yes, please check all that apply.

Sporting Events _____

Community Dinners _____

Potlatches _____

Health Presentations _____

Makah Days Events _____

MTC Quarterly/Annual Meetings _____

Neah Bay K-12 School Events _____

Other (Please specify)_____

ABOUT YOUR MAKAH HOUSEHOLD MEMBERS AND WHALING IN 1999...

5. Were you watching television when the 1999 whale was harpooned and killed?
Yes _____ No _____

6. Were any of your Makah household members watching TV when the 1999 whale was harpooned and killed?
Yes _____ No _____

7. If yes, how many Makah household members were watching TV when the 1999 whale was harpooned and killed?
_____

8. Were you on Front Beach, or in a boat/canoe on the water, when the 1999 whale was brought ashore?
Yes _____ No _____

9. Were any of your Makah household members on Front Beach or in a boat/canoe on the water, when the 1999 whale was brought ashore?
Yes _____ No _____

10. If yes, how many? _____

11. Did any Makahs who live off the reservation come to spend the night at your house from May 17, 1999, the night the whale came ashore, to May 22, 1999, the night of the Tribe's celebration?
Yes _____ No _____

12. If yes, how many non-resident Makahs spent the night at your house from May 17, 1999 till May 22, 1999.

_____

13. Did you attend the Makah Tribe's celebration of the 1999 whale on May 22, 1999?

Yes _____ No _____

14. If yes, which events? Check all that apply.

Parade _____

Dinner _____

15. If you attended the dinner, in which way did you participate? Check all that apply.

Attended the dinner _____

Helped butcher the whale_____

Helped cook the whale _____

Helped cook other items at the dinner _____

Helped serve at the dinner _____

Helped set up the gym _____

Helped decorate the gym _____

Sang at the dinner _____

Other (Please specify) _____

16. Did any of your Makah Household members attend the Makah Tribe's celebration of the 1999 whale on May 22, 1999?

Yes _____ No _____

17. If yes, how many Makah household members attended the Makah Tribe's celebration of the 1999 whale on May 22, 1999?_____

18. For each Makah household member, please check which events s/he attended. Check all that apply.

	#1	#2	#3	#4	#5	#6
Parade						
Dinner						

19 If Makah household members attended the dinner, in which way did each participate? Check all that apply.

	#1	#2	#3	#4	#5	#6
Attend the dinner						
Helped butcher the whale						
Helped cook the whale						
Helped cook other dinner items						
Helped serve at the dinner						
Helped set up the gym						
Sang at the dinner						
Other (Please specify)						

20. Did your household receive meat from the 1999 whale?
Yes_____ No_____

If no, skip to question 23.

21. What did you do with the meat? (Check all that apply.)

Prepare it _____

Redistribute it _____

other _____

22. If you prepared it, what did you do? (Check all that apply.)

Jerky _____

Roasts _____

Stew _____

Steaks _____

Smoked meat _____

Other (Please specify) _____

Now skip to question 24.

23. Would you have liked to get meat from this whale?
Yes _____ No _____

24. Did your household receive blubber from the 1999 whale?
Yes _____ No _____

If no, skip to question 27.

25. What did you do with the blubber? (Check all that apply.)

Prepare it _____

Redistribute it _____

Other _____

26. If you prepared it, what did you do? (Check all that apply.)

Smoked it _____

Rendered it _____

Ate it raw _____

Pickled it _____

Boiled it _____

Cosmetics _____

Other (Please specify.) _____

Now skip to question 28.

27. Would you have liked to receive blubber from the 1999 whale?
Yes _____ No _____

28. Did your household receive whale oil from someone as a result of the 1999 whale?
Yes _____ No _____

29. Did your household receive any other parts from the 1999 whale?
Yes _____ No _____

30. If yes, what parts did your household receive? What did you do with them?

31. Were there any other parts of the 1999 whale you would have liked your household to receive?
Yes _____ No _____

32. If yes, which ones?

ABOUT YOUR MAKAH HOUSEHOLD AND OTHER WHALING ACTIVITIES...

33. Would you like to have whale oil in your household on a regular basis?
Yes _____ No _____

34. Would you like to have whale meat in your household on a regular basis?
Yes _____ No _____

35. Would you like to have whale blubber in your household on a regular basis?
Yes _____ No _____

36. Would you like to have whale bone in your household on a regular basis?
Yes _____ No _____

37. Please check all whaling activities that you have been involved in since the 1999 whale was caught.

Member of whaling crew _____

Member of Whaling Commission _____

Butchering whale _____

Cooking whale _____

Smoking whale _____

Rendering oil _____

Eating whale products _____

Redistributing whale products to other Makahs _____

Participating in whaling ceremonial activities _____

Carving whale bone _____

ABOUT YOUR OPINIONS REGARDING WHALE HUNTING...

39. Should the Tribe continue to hunt whale? Yes _____ No _____

40. What are the reasons for your answer?

41. If you answered yes to 39, do you think whale hunting has been a positive thing for the Tribe? Yes _____ No _____

42. What are your reasons for this answer?

43. Would you like to have more access to whale products in the future?

Yes _____ No _____

If yes, go to 44. If no, go to 45.

44. Which whale products would you like more of in the future?

raw meat _____

meat cooked or preserved by someone else _____

raw blubber _____

whale oil _____

bone _____

other (specify) _____

45. Would you like more information about any of the following? Check all that apply.

Whale hunting _____

Cooking whale meat _____

Butchering whale _____

Rendering oil _____

Smoking meat _____

Cleaning whale bone _____

Carving whale bone _____

Other (Specify) _____

46. Are there any other comments you would like to make?

APPENDIX 3

MAKAH HOUSEHOLD SURVEY METHODOLOGY

The survey was administered by the Makah Cultural and Research Center, an institution with twenty-two years of experience conducting household surveys on the Makah Reservation. The author of the instrument conducted numerous household surveys in the Makah community over the last twenty-two years; each of these surveys employed the same methodology. Results were tabulated and analyzed by the developer of the survey instrument.

In order to conduct the most accurate survey possible, the Household Whaling Survey is based on the following:

1. Names of households to be surveyed were drawn randomly from the Makah Tribe's Turkey Distribution List. This list contains all households on the reservation in which at least one enrolled Makah resides. 34.6% of the Tribe's 471 Makah households were interviewed.

2. All surveys were conducted in person by an enrolled Makah trained in proper survey procedures, who insured all respondents that confidentiality would be protected.

3. The survey contacted 217 of the Tribes 471 households. Of this number, 159 households agreed to be interviewed. Interestingly enough, four of the Makahs who publicly challenged the Tribe's decision to whale had their respective names randomly drawn to be surveyed. Because the Tribe wanted to minimize external influences on the survey administration, these four individuals were not surveyed. However, to maintain proper responses, these individuals were marked to answer negatively to all questions which asked for positive or negative opinions regarding Makah whaling, access to whale products, and use of whale products, as per their publically expressed opinions. Question marks indicate responses for which the survey had no information at all.

   Counting these four individuals, the total number of respondents for the survey is tallied at 163. Percentages are tallied accordingly. Five household volunteered to be included in the survey. While these households were encouraged to complete a survey form, these five respondents were NOT included in the random population of 163.

4. All survey respondents had to be enrolled Makahs with a reservation household; all respondents also had to be twenty-one years of age or older. Survey methodology assumes that each respondent is capable of answering questions about his/her own ideas and activities regarding whaling, as well as the activities of his/her household members regarding whaling.

5. A master list which related each chosen household to an exclusive number was kept at the Makah Cultural and Research Center to avoid duplication and protect confidentiality. Surveyors returned completed surveys to the Makah Cultural and Research Center, which maintained security for the documents. All completed surveys are archived at the Makah Cultural and Research Center.

6. The author/tabulator did not know the names of the respondents, and related to surveys by number only.

7. Certain questions allowed for multiple responses. Others did not. In addition, certain questions only allowed respondents who had answered a previous question a particular way to answer. Incidents of both types are indicated on the survey instrument, which is appended in 2. On the tabulation sheet, the base number of respondents is indicated by R= . R=163 means that the percentage is calculated based on the answers of 163 respondents.

8. Internal checks and balances were placed in the instrument to encourage data validity.

9. Answers are reported as percentages calculated from the base number of respondents appropriate to each question. Percentages are rounded to the nearest tenth.

TREATY WITH THE MAKAH, 1855.

Jan. 31, 1855.

12 Stat., 939. Ratified Mar. 8, 1859. Proclaimed Apr. 18, 1859.

Articles of agreement and convention, made and concluded at Neah Bay, in the Territory of Washington, this thirty-first day of January, in the year eighteen hundred and fifty-five, by Isaac I. Stevens, governor and superintendent of Indian affairs for the said Territory, on the part of the United States, and the undersigned chiefs, head-men, and delegates of the several villages of the Makah tribe of Indians, viz: Neah Waatch, Tsoo-Yess, and Osett, occupying the country around Cape Classett or Flattery, on behalf of the said tribe and duly authorized by the same.

Surrender of lands to the United States.

Boundaries.

ARTICLE 1. The said tribe hereby cedes, relinquishes, and conveys to the United States all their right, title, and interest in and to the lands and country occupied by it, bounded and described as follows, viz: Commencing at the mouth of the Oke-ho River, on the Straits of Fuca; thence running westwardly with said straits to Cape Classett or Flattery; thence southwardly along the coast to Osett, or the Lower Cape Flattery; thence eastwardly along the line of lands occupied by the Kwe-déh-tut or Kwill-eh-yute tribe of Indians, to the summit of the coast-range of mountains, and thence northwardly along the line of lands lately ceded to the United States by the S'Klallam tribe to the place of beginning, including all the islands lying off the same on the straits and coast.

Reservation.

Boundaries.

ARTICLE 2. There is, however, reserved for the present use and occupation of the said tribe the following tract of land, viz: Commencing on the beach at the mouth of a small brook running into Neah Bay next to the site of the old Spanish fort; thence along the shore round Cape Classett or Flattery, to the mouth of another small stream running into the bay on the south side of said cape, a little above the Waatch village; thence following said brook to its source; thence in a straight line to the source of the first-mentioned brook, and thence following the same down to the place of beginning; which said tract shall be set apart, and so far as necessary surveyed and marked out for their exclusive use; nor shall any white man be permitted to reside upon the same without permission of the said tribe and of the superintendent or agent; but if necessary for the public convenience, roads may be run through the said reservation, the Indians being compensated for any damage thereby done them. It is, however, understood that should the President of the United States hereafter see fit to place upon the said reservation any other friendly tribe or band to occupy the same in common with those above mentioned, he shall be at liberty to do so.

Whites not to reside thereon unless, etc.

Roads may be made.

Other friendly bands may be placed thereon.

Indians to settle on reservation within a year.

ARTICLE 3. The said tribe agrees to remove to and settle upon the said reservation, if required so to do, within one year after the ratification of this treaty, or sooner, if the means are furnished them. In the mean time it shall be lawful for them to reside upon any land not in the actual claim and occupation of citizens of the United States, and upon any land claimed or occupied, if with the permission of the owner.

Rights and privileges secured to Indians.

ARTICLE 4. The right of taking fish and of whaling or sealing at usual and accustomed grounds and stations is further secured to said Indians in common with all citizens of the United States, and of erecting temporary houses for the purpose of curing, together with the privilege of hunting and gathering roots and berries on open and unclaimed lands: *Provided, however*, That they shall not take shell-fish from any beds staked or cultivated by citizens.

Proviso.

Payments by the United States.

ARTICLE 5. In consideration of the above cession the United States agree to pay to the said tribe the sum of thirty thousand dollars, in the following manner, that is to say: During the first year after the ratification hereof, three thousand dollars; for the next two years, twenty-

five hundred dollars each year; for the next three years, two thousand dollars each year; for the next four years, one thousand five hundred dollars each year; and for the next ten years, one thousand dollars each year; all which said sums of money shall be applied to the use and benefit of the said Indians, under the direction of the President of the United States, who may from time to time determine at his discretion upon what beneficial objects to expend the same. And the superintendent of Indian affairs, or other proper officer, shall each year inform the President of the wishes of said Indians in respect thereto.

How to be applied.

ARTICLE 6. To enable the said Indians to remove to and settle upon their aforesaid reservation, and to clear, fence, and break up a sufficient quantity of land for cultivation, the United States further agree to pay the sum of three thousand dollars, to be laid out and expended under the direction of the President, and in such manner as he shall approve. And any substantial improvements heretofore made by any individual Indian, and which he may be compelled to abandon in consequence of this treaty, shall be valued under the direction of the President and payment made therefor accordingly.

Appropriation for removal and for clearing and fencing land, etc.

ARTICLE 7. The President may hereafter, when in his opinion the interests of the Territory shall require, and the welfare of said Indians be promoted thereby, remove them from said reservation to such suitable place or places within said Territory as he may deem fit, on remunerating them for their improvements and the expenses of their removal, or may consolidate them with other friendly tribes or bands; and he may further, at his discretion, cause the whole, or any portion of the lands hereby reserved, or such other land as may be selected in lieu thereof, to be surveyed into lots, and assign the same to such individuals or families as are willing to avail themselves of the privilege, and will locate thereon as a permanent home, on the same terms and subject to the same regulations as are provided in the sixth article of the treaty with the Omahas, so far as the same may be practicable.

Indians may be removed from the reservation.

Tribes may be consolidated.

Ante, p. 612.

ARTICLE 8. The annuities of the aforesaid tribe shall not be taken to pay the debts of individuals.

Annuities of tribe not to pay individual debts.

ARTICLE 9. The said Indians acknowledge their dependence on the Government of the United States, and promise to be friendly with all citizens thereof, and they pledge themselves to commit no depredations on the property of such citizens. And should any one or more of them violate this pledge, and the fact be satisfactorily proven before the agent, the property taken shall be returned, or in default thereof, or if injured or destroyed, compensation may be made by the Government out of their annuities. Nor will they make war on any other tribe except in self-defence, but will submit all matters of difference between them and other Indians to the Government of the United States or its agent for decision and abide thereby. And if any of the said Indians commit any depredations on any other Indians within the Territory, the same rule shall prevail as that prescribed in this article in case of depredations against citizens. And the said tribe agrees not to shelter or conceal offenders against the United States, but to deliver up the same for trial by the authorities.

Indians to preserve friendly relations.

To pay for depredations.

Not to make war, except.

To surrender offenders.

ARTICLE 10. The above tribe is desirous to exclude from its reservation the use of ardent spirits, and to prevent its people from drinking the same, and therefore it is provided that any Indian belonging thereto who shall be guilty of bringing liquor into said reservation, or who drinks liquor, may have his or her proportion of the annuities withheld from him or her for such time as the President may determine.

Annuities to be withheld from those drinking ardent spirits.

ARTICLE 11. The United States further agree to establish at the general agency for the district of Puget's Sound, within one year from the ratification hereof, and to support for the period of twenty years, an agricultural and industrial school, to be free to children of the said tribe in common with those of the other tribes of said district and to

United States to establish an agricultural, etc., school for the Indians; to provide tools and employ mechanics, etc.

provide a smithy and carpenter's shop, and furnish them with the necessary tools and employ a blacksmith, carpenter and farmer for the like term to instruct the Indians in their respective occupations. *Provided, however*, That should it be deemed expedient a separate school may be established for the benefit of said tribe and such others as may be associated with it, and the like persons employed for the same purposes at some other suitable place. And the United States further agree to employ a physician to reside at the said central agency, or at such other school should one be established, who shall furnish medicine and advice to the sick, and shall vaccinate them; the expenses of the said school, shops, persons employed, and medical attendance to be defrayed by the United States and not deducted from the annuities.

A physician, etc.

The tribe is to free all slaves and not to acquire others.

ARTICLE 12. The said tribe agrees to free all slaves now held by its people, and not to purchase or acquire others hereafter.

Not to trade out of the United States.

Foreign Indians not to reside on the reservation.

ARTICLE 13. The said tribe finally agrees not to trade at Vancouver's Island or elsewhere out of the dominions of the United States, nor shall foreign Indians be permitted to reside in its reservation without consent of the superintendent or agent.

When treaty to take effect.

ARTICLE 14. This treaty shall be obligatory on the contracting parties as soon as the same shall be ratified by the President of the United States.

In testimony whereof, the said Isaac I. Stevens, governor and superintendent of Indian affairs, and the undersigned, chiefs, headmen and delegates of the tribe aforesaid have hereunto set their hands and seals at the place and on the day and year hereinbefore written.

MAKAH TRIBE

P.O. BOX 115 • NEAH BAY, WA 98357 • 360-645-2201

The Makah Tribe is an equal opportunity employer.

RESOLUTION NO.: **17-05**
DATE ENACTED: **02-03-05**

RESOLUTION NO. 17-05 OF THE MAKAH TRIBAL COUNCIL

WHEREAS, the Makah Tribal Council is the governing body of the Makah Indian Tribe of the Makah Indian Reservation, Washington, by authority of the Constitution and Bylaws of the Makah Indian Tribe as approved on May 16, 1936, by the Secretary of the Interior; and

WHEREAS, the Makah Tribe has a documented whaling tradition and has depended on whaling as the basis of its economy, subsistence, and culture for at least 1,500 years; and

WHEREAS, the 1855 Treaty of Neah Bay secures in perpetuity the Tribe's right of taking fish and whaling and sealing at all usual and accustomed grounds and stations; and

WHEREAS, the June 7, 2004 second amended opinion by the Ninth Circuit Court of Appeals on *Anderson v. Evans* 371 F.3d 475 (9th Cir. 2004) requires the Makah Tribe to seek a waiver and/or permit under the Marine Mammal Protection Act (MMPA) in order to exercise the whaling rights secured in the Treaty of Neah Bay.

NOW THEREFORE BE IT RESOLVED the Chairman of the Makah Tribal Council is authorized to submit the attached application under Section 101(a)(3) of the Marine Mammal Protection Act (MMPA), 16 U.S.C. § 1371(a)(3), to the National Oceanic and Atmospheric Administration for a waiver of the moratorium on the taking of taking of marine mammals which would allow the Tribe to conduct a Treaty ceremonial and subsistence (C&S) harvest of up to 20 gray whales from the Eastern North Pacific (ENP) stock in a five-year period, with a maximum of five whales per year.

Re: Makah Tribe's clarification of MMPA waiver request application

Dear Dr. Hogarth,

On February 11, 2005, the Makah Tribal Council (Tribe) submitted a request to the National Marine Fisheries Service (NMFS) for a waiver of the Marine Mammal Protection Act (MMPA) take moratorium that would allow a limited harvest from the Eastern North Pacific stock of gray whales as secured in the 1855 Treaty of Neah Bay. We specified in the 2005 request that the total take of gray whales for which the Tribe seeks a waiver is up to 20 gray whales in any five-year period, subject to a maximum of five gray whales in any calendar year.

While our prior request focused on the MMPA waiver and also sought a simultaneous review under the National Environmental Policy Act (NEPA), we recognize that NMFS must analyze the proposed hunting activities in the context of additional laws and regulations. This letter clarifies that the Tribe is asking NMFS to analyze the 2005 request to conduct Treaty ceremonial and subsistence hunting of gray whales under whatever authorities it may deem applicable. In making this request, the Tribe reserves its right to contest a future determination by the United States government that a particular law or regulation may be applied to restrict the Tribe's ability to exercise its whaling rights under the Treaty of Neah Bay.

Sincerely,

MAKAH TRIBAL COUNCIL

Ben Johnson, Jr.
Chairman

Resolution No. 57-01
Date Enacted 5-30-01
subject Matter: Makah Gray Whale Management Plan Amendments

RESOLUTION NO. 57-01 OF THE MAKAH TRIBAL COUNCIL

WHEREAS, the Makah Tribal Council is the governing body of the Makah Indian Tribe of the Makah Indian Reservation, Washington, by authority of the Constitution and By-Laws of the Makah Indian Tribe as approved on May 16, 1936, by the Secretary of the Interior;

WHEREAS, the Treaty of Neah Bay secures in perpetuity the Tribe's right of taking fish and whaling and sealing at all usual and accustomed grounds and stations;

WHEREAS, on October 23, 1997, the International Whaling Commission approved the Makah Tribe's request for an aboriginal subsistence quota of 20 gray whales which my be taken between the years 1998 and 2002;

WHEREAS, on January 341998, the Council adopted Resolution No. 67-98 which adopted the Management Plan for Makah Treaty Gray Whale Hunting for the Years 1998-2002;

WHEREAS, after consultation with the Makah Whaling Commission and the National Marine Fisheries Service, the Council has determined that it is necessary to amend the Management Plan so as to allow for greater flexibility in the times and areas in which Tribal members are permitted to hunt while still providing a high margin of safety for the conservation of the gray whale and public safety;

NOW THEREFORE BE XT RESOLVED that Makah Gray Whale Management Plan for 1998-2002 is hereby amended as set forth in the Makah Gray Whale Management Plan for 1998-2002 As Amended April 2001 attached hereto.

MANAGEMENT PLAN FOK MAKAH TREATY GRAY WHALE · HUNTING FOR THE YEARS 1998-2002 AS AMENDED APRIL 2001

I. Introduction.

The purpose of this plan is to set forth the Makah Tribe's management intent and applicable Tribal regulations to govern the exercise of treaty ceremonial and subsistence whaling rights during the period 1998 through 2002. This management plan is adopted pursuant to Article 4 of the Treaty of Neah Bay, and the International Convention for the Regulation of Whaling ("ICRW") Schedui: Amendment adopted by the International Whaling Commission ("IWC") on October 23, 1997, Under the ICRW Schedule Amendment, the Makah. Tribe is authorized to share a five year aboriginal subsistence quota of 620 gray whales with the indigenous people of Chukotka, Russia.

The IWC was informed that under an Agreement between NOAA and the Council, the Makah gray whale harvest would not exceed 5 1 anded whales per year. The management plan contains a number of additional manage nent measures adopted voluntarily by the Tribe to ensure the orderly development of safe, humane, and culturally appropriate whale hunts. In accordance with the ICRW Schedule Amendment, the management plan strictly prohibits com nercial sale of whale products except for traditional handicrafts (including artwork) made from non-edible parts of the whale. No international trade is permitted.

It is the Tribe's intent to provide for the gradual development of ceremonial and subsistence whale hunts over the five-year period so as to allow for the development of Tribal management capabilities, refinement of hunting methods, and assessment of the Tribe's cultural and subsistence needs. The Tribe intends to utilize the experience and information collected during the five year term of this plan to develop a second multi-year plan, pending IWC review of the current ICRW Schedule. The conservative management approach provided for in this management plan is not intended to limit, waive or modify any of the Tribe's whaling rights under the Treaty of Neah Bay and any such construction of this plan is improper and unauthorized.

11. Definitions.

A. "Calf" means any whale less than 1 year old or having milk in its stomach.

B. "Council" means the Makah Tribal Council.

C. "Commission" means the Makah Whaling Commission.

D. "Landing" means bringing a whale or any parts of a whale onto land in the course of whaling operations.

E. "Member" means an enrolled member of the Makah Indian Tribe.

F. "Natural Resources Department" or "NRD" means the Makah Natural Resource Department.

G. "Strike" means any blow or blows delivered to a whale by a harpoon, lance, rifle, explosive device or other weapon., When used as a verb, "strike" means the act of delivering such a blow or blows to a whale. A harpoon blow is a strike only if the harpoon is embedded in the whale. Any rifle shot which hits a whale is a strike, For purposes of Parts III.C and III.F, multiple strikes on a single whale shall count as a single strike.

H. "Take" means to flag, buoy or make fast to a whale catcher, including a canoe, chase boat or support boat.

I. "Tribe" means and "tribal" refers to the Makah Indian Tribe.

J. "Whale products" means any unprocessed part of a whale and blubber, meat, bones, whale oil, meal and baleen.

K. "Whaling" means the scouting for, hunting, striking, killing, or landing of a whale.

L. "Whaling captain" means the member in charge of a whaling team who holds a whaling permit issued by the Commission and approved by the

Council under this management plan.

M. "'Whaling expedition" means a complete voyage in which a whaling team leaves port or shore for the purpose of whaling and returns to port or shore.

N. "Whaling team" means a group of members under the control of a whaling captain who holds a whaling permit issued by the Commission and approved by the Council under this management plan.

III. Harvest **Quotas/Strike** Limits.

A. The total number of gray whales taken by members in any one calendar year shall not exceed five (5).

B. The total number of gray whales taken by members between 1998 and 2002 shall not exceed twenty (20).

C. The total number of gray whales struck by members between 1998 and 2002 shall not exceed thirty-three (33), provided that the Commission and the Council will take prudent management measures to reduce the ratio of struck whales to landed whales in any one calendar year to no more than 2:1. The total number of gray whales struck by members between 2001 and 2002 shall not exceed fourteen (14).

D. No member may strike a gray whale calf or a female gray whale accompanied by a cal for calves.

E. No member may strike a whale other than a gray whale.

F. The total number of gray whales struck by members between 2001 and 2002 in the Strait of Juan de Fuca east of the Tatoosh-Bonilla line or between June 1 and November 30 in the Pacific Ocean west of the Tatoosh-Bonilla line shall not exceed five (5).

IV. Permits.

A. No member may engage in whaling except under the control of a whaling captain who is in possession of a valid whaling permit issued by the Commission and approved by the Council. All whaling permits issued by the Commission and approved by the Council shall incorporate all of the requirements of this management plan and any additional requirements the Commission and Council deem appropriate. Upon reaching the strike limit in Part III.F above. whaling permits shall be issued with the intern of targeting migrating, whales.

B. Any whaling permit issued by the Commissior and approved by the Council shall be issued only to a whaling captain certified by the Commission pursuant to Part V below. The permit shall identify the vessels which will participate in the hunt, the mc ubers who will be part of the caplain's whaling team, and the boundaries of the designated area in which hunting will be permitted.

C. The Commission shall not issue and the Council shall not approve a whaling permit without determining that the whaling captain and each whaling team member has been certified by the Commission as qualified to perform his assigned role on the whaling, team.

D. The Council shall provide at least 24 hours advance notice to the National Marine Fisheries Service ("NMFS") and the United States Coast Guard ("USCG") prior to approving a whaling permit. The advance notice requirement shall not apply if a NMFS observer is already present on the Makah Reservation. The whaling captain shall coordinate with the on-site NMFS observer and the Coast Guard prior to departing on a whaling expedition.

E. A whaling permit shall terminate when any one of the following events occurs: (1) the whaling team lands a gray whale; (2) the whaling team. strikes a gray whale but is unable to land it; (3) the whaling team has not struck or landed a whale within 1.0 days of permit approval; or (4) the Commission or the Council determine, for any reason, to terminate the permit.

F. The Commission may issue a whaling permit only after determining that there is an unmet traditional subsistence or cultural need for whale products in the tribal community.

V. Training/Qualifications.

The Commission shall establish certification guidelines and a certification process for whaling captains, harpooners, riflemen, divers, canoe paddlers, and other whaling teammembers. The certification guidelines and the certification process shall ensure that every whaling captain and each member who serves on a whaling team has received adequate training to perform his assigned role on the team. Certification of riflemen shall include a demonstration of proficiency and accuracy under simulated hunting conditions.

VI. Whaling Vesselis, Equipment and Hunting Method:,.

A. A whaling team must include one or more canoes, one or more chase boats, and one or more support boats.

B. All canoes used in whaling must be at least 30 feet in length and manned by a harpooner and at least six paddlers.

C. All. chase boats used in whaling must be at least 18 feet in length and powered by an, engine large enough to tow an adult gray whale: to port, Each chase boat shall be manned by a pilot, diver, rifleman, and harpooner. The diver or an additional crew member shall act as a safety officer. One boat shall be equipped with a navigation system capable of precisely fixing the vessel's position on the water.

D. All whaling harpoons must be equipped with a toggle point, connected to one or more floats, and bear a permanent distinctive mark identifying the whaling captain who is in charge of the whaling team using the harpoon.'

E. The rifle used in gray whale hunts shall be ran adequate very high-powered rifle (.458 caliber or higher), approved by the Commission far use in whaling.

F. The first strike made upon a gray whale shal I be r ade by the harpooner on a canoe and shall affix one or more floats to the whale. The chase boat will pursue the whale and the rifleman aboard the chase boat will kill the whale as expeditiously as practicable with rifle shots directed at the whale's brain and upper spinal cord.

G. The rifleman on the chase boat shall not discharge his weapon until authorized to fire by the safety officer. The safety offices will. not authorize the discharge of the rife unless: (1) the barrel of the rifle is above and within 30 feet or less from the target area of the whale; and (2) the safety officer determines that the riflemar's field of view is clear of all persons, vessels, buildings:, vehicles, highways and other objects or structures that if hit by a rifle shot could cause injury to human life or property.

H. The whaling captain will suspend the hunt, if the safety officer determines that visibility is less than 500 yards in any direction.

I. Upon the death of a whale, the chase boat crew will secure the whale for towing to shore. The whale will be expeditiously towed to shore by a chase or support boats.

J. By following the general procedures set out herein , whaling teams shall make best efforts to land every whale that is struck and shall ensure that the hunt does not pose a risk to human life and property.

K. The Commission shall conduct research and development to further refine the hunting methods set out in this management plan. Upon consultation with the Commission and the National Marine Fisheries Service, the Council may periodically amend the provisions of this part to improve the safety, effectiveness and humaneness of gray whale hunts.

'VII, Area **Restrictions.**

A. All whaling shall occur within the adjudicated usual and accustomed grounds of the Makah Tribe.

B. Within the area open to whaling under paragraph A above, whaling may be confined to an area designated by the Commission and the Council in each whaling permit.

C. The initial strike of a whale shall not occur within 200 yards of Tatoosh Island or White Rock between May and September.

D. A whale shall not be struck within the "closed area" designated in Section 10.5.02 of the Makah Law and Order Code (Weapons Control Ordinance No, 43 enacted 9/5/89) or east of the "closed area" to a line extending from the southern end of Waadah Island to Baada Point

E. Whaling may occur only within the Regulated Navigation Area (RNA) established by the United States Coast Guard as amended.

VIII. Use of Meat and Whale Products.

A. Whale products taken pursuant to this management plan shall be used exclusively for local consumption and ceremonial purposes and may not be sold or offered for sale. No member may receive money for participation in whaling.

B. Notwithstanding paragraph A above, traditiona 1 handicrafts (including artwork) made from non-edible whale product,: may be sold or offered for sale within the United States. A member may not engage in international trade of these handicrafts.

C. The Commission shall periodically monitor the utilization of whale products within whaling families and the tribal community to determine when an unmet need for whale meat or other products exists The Commission may conduct research. in order to accurately and

systematically estimate the 'Tribe's traditional subsistence and cultural needs.

IX. Monitoring and Reporting.

A. A Makah Natural Resources Department ("NRD") representative will accompany each whaling team as an observer. Upon request of NMFS, the NRD representative will permit an additional observer from the Northwest Region of the National Marine Fisheries Service to observe the hunt.

B. The NRD observer shall. be responsible for recording the time, date and precise location of each whale struck. For each whale struck, the NRD observer shall record whether the whale is landed. If the whale is not landed, the NRD observer shall describe the circumstances associated with the striking of the whale and estimate whether the animal suffered a wound that might be fatal.

C. For each whale landed, the NRD observer shall record the body length (as measured from the point of the upper jaw to the notch between the tail flukes), the extreme width of the flukes, and the sex of the whale. The NRD observer shall also record the length and sex of any fetus in the landed whale.

D. The NRD observer shall record the time interval between the initial strike and the death of the whale.

E. The NRD shall be responsible for compiling and transmitting the weekly and annual reports required under the Agreement between the Council and NOAA. During periods in which whaling permits have been issued, the NRD will provide the National Marine Fisheries Service with a weekly oral report regarding the number of whales struck and landed. To the extent specified in any bilateral agreement, the NRD will also provide periodic oral or written reports regarding the number of whales struck and landed to representatives of the Russian Federation,

F. By January 30 of each year, the NRD and the National Marine Fisheries Service will prepare a joint written report compiling all of the data. accorded by the NRD under paragraphs B through D above, as well as any additional data recorded by National Marine Fisheries Service personnel.:

G. The NRD will assist National Marine Fisheries Service personnel in the collection of specimen material from landed whales, including but not limited to, ovaries, ear plugs, baleen plates, stomach contents, and tissue samples. The NRD may collect additional samples for its own use as part of the Tribe's research and management activities.

X. Enforcement.

A. The Natural Resources Enforcement Division shall be the Tribal law enforcement agency responsible for enforcing the requirements of whaling permits and this management plan.

B. Any member found whaling in violation of this management plan or the terms of a whaling permit issued by the Commission and approved by the Council. shall be subject to prosecution in Tribal Court for a Class AA criminal offense in accordance with the procedures set forth in Title 2 of the Makah Law and Order Code.

C. A whaling captain shall be deemed liable for any violations of a whaling permit or this management plan committed by a member of a whaling team under his control.

XI. Penalties.

A. Any member convicted by the Tribal Court of the offense of whaling in violation of this management plan or the terms of any whaling permit issued by the Council shall be subject to the penalties for a Class AA criminal offense under Section 5.8.01 of the Makah Law and Order

Code?

B. Members convicted of said offense may also be barred from exercising treaty fishing, hunting and/or whaling rights for up to three (3) years.

C. In determining the severity of punishment, the Court shall consult with the Commission and take into account the seriousness of the injury to the Tribe and Tribal resources.

XII. Amendments.

The Council may amend this management plan from time to time in consultation with the Commission and NOAA as new information becomes available, provided that the requirements of the management plan shall comply with the ICRW Schedule Amendment, any cooperative agreement between NOAA and the Council, and all applicable federal law.

[1] Section 5.8.01 of the Makah Law and Order Code currently provides that Class AA offenses are punishable by a fine not to exceed $5000 and imprisonment not to exceed 12 months.

Appendix B

Makah Tribe's 2013 Whaling Ordinance

RESOLUTION NO.: 118-13

DATE ENACTED: 8-13-2013

SUBJECT MATTER: Makah Whaling Ordinance

RESOLUTION NO. 118-13 OF THE MAKAH TRIBAL COUNCIL

WHEREAS, the Makah Tribal Council is the governing body of the Makah Indian Tribe under the Tribe's Constitution and Bylaws approved on May 16, 1936, by the Secretary of the Interior; and

WHEREAS, the Makah Tribe has a documented whaling tradition and has depended on whaling as the basis of its economy, subsistence, and culture for at least 1,500 years; and

WHEREAS, the Treaty of Neah Bay secures in perpetuity the Tribe's right of taking fish and whaling and sealing at all usual and accustomed grounds and stations;

WHEREAS, the Tribal Council is authorized under Article VI, § 1(i) of the Tribe's Constitution to promulgate and enforce ordinances governing the conduct of members of the Tribe, and under Article VI, § 1(j) to safeguard and promote the health, safety and general welfare of the Tribe; and

WHEREAS, the Tribal Council recognizes the paramount importance of whaling to the Makah Tribe and the central role that effective management of whales and regulation of whaling must play in the Tribe's exercise of its treaty whaling right; and

WHEREAS, the Makah Tribe previously managed and regulated whaling under a management plan adopted on January 30, 1998 by Resolution No. 67-98; and

WHEREAS, the Tribal Council finds that it is necessary to adopt the Makah Whaling Ordinance to implement the Makah Tribe's management, regulation and enforcement of the Tribe's treaty whaling right.

NOW THEREFORE BE IT RESOLVED, that the Makah Tribal Council hereby adopts the Makah Whaling Ordinance, a copy of which is attached to this Resolution. The Ordinance so adopted shall supersede all prior Makah whaling management plans and amendments thereto and whaling regulations upon approval by the Secretary of the Interior.

MAKAH TRIBAL COUNCIL

Timothy J. Greene, Sr.
Chairman

CERTIFICATION

The foregoing Resolution was adopted at a regular meeting held on Aug 13, 2013, at which a quorum was present, and the Resolution was adopted by a vote of 4 FOR and 0 AGAINST, the Chairperson, or the Vice-Chairperson in his absence, being authorized to sign the Resolution.

MAKAH WHALING ORDINANCE

Introduction and Declaration of Policy

The Makah Tribe has a tradition of hunting whales off the northwestern tip of the Olympic Peninsula that has endured for at least 1,500 years. Whaling was, and continues to be, central to the Tribe's way of life, providing a primary means of subsistence as well as essential spiritual, social and cultural functions. The need to continue whaling was so important to the Tribe that when it negotiated the 1855 Treaty of Neah Bay with the United States, it reserved the right of whaling, making it the only tribe with whaling rights expressly protected by federal law. In the early twentieth century, Makah whaling declined because of the overexploitation of Pacific Ocean whale stocks by non-Indian commercial whaling operations. In contrast with this depletion by Yankee whalers, the Makah Tribe has always sought to live in harmony with the abundant resources of its marine environment. It is the purpose of the Tribe in adopting this Ordinance to control and manage all whaling by Tribal members in order to achieve sustainable utilization and conservation of whales, implement the whaling rights reserved by the Treaty of Neah Bay and preserve the treaty right for future generations of Makahs.

This Ordinance sets forth the Makah Tribe's management intent and applicable Tribal law governing the exercise of treaty ceremonial and subsistence whaling rights. The Makah Tribal Council enacts the Makah Whaling Ordinance pursuant to the inherent authority of the Council to manage Tribal members' exercise of the Tribe's treaty whaling rights and the authority vested in it by Article VI, Sections 1(i) and 1(j) of the Makah Constitution and Bylaws.

The Council's intent under this Ordinance is to authorize the hunting of only gray whales pursuant to the International Whaling Commission (IWC) aboriginal subsistence whaling catch limit and federal regulations promulgated pursuant to the Tribe's pending application for a waiver of the Marine Mammal Protection Act's take moratorium. The Council will amend this Ordinance to authorize the hunting of other species of whales only if approval for such whaling is obtained under international and federal law.

The Makah Whaling Ordinance contains general provisions for the exercise of whaling rights and provides for Council adoption of regulations regarding harvest quotas, strike limits and time and area restrictions and for Council issuance of whaling permits which may contain additional limitations. The Ordinance also contains a number of management measures to ensure the orderly development of safe, efficient, humane, and culturally appropriate whale hunts. The Ordinance strictly prohibits commercial sale of whale products except for sale within the United States of traditional handicrafts (including artwork) made from non-edible parts of the whale. The Ordinance contains provisions relating to the use of stranded whales.

The Ordinance also specifies penalties for violations of its provisions, Makah whaling regulations and whaling permits. Because the treaty whaling right is fundamental to the Tribe, the Council intends for the Ordinance and the regulations and permits issued under it to be applied strictly and for violations to be prosecuted to the full extent of Tribal law. The whaling right is central to the subsistence needs, culture and identity of the Makah Nation and belongs to present and future generations of Makahs. Any action by an individual that jeopardizes the Tribe's whaling right shall be subject to serious consequences.

The management of treaty ceremonial and subsistence whaling provided for in the Makah Whaling Ordinance and any regulations adopted or permits issued by the Council shall not limit, waive or modify any of the Tribe's whaling rights under the Treaty of Neah Bay and any such construction of this Ordinance, Makah whaling regulations or whaling permits is improper and unauthorized.

Chapter 1. General Provisions

1.010 Title.

This Ordinance shall be known as the "Makah Whaling Ordinance."

1.020 Prior Tribal Whaling Laws Superseded.

This Ordinance supersedes all prior Makah whaling management plans and whaling regulations.

1.030 Treaty Whaling Rights – Authority of the Makah Tribal Council.

The whaling rights reserved expressly to the Makah Tribe in the Treaty of Neah Bay are reserved to the Makah Tribe as a whole. The exercise of these treaty reserved whaling rights by a Tribal member is a privilege extended to that member by the Makah Tribe through its representative and governing body, the Makah Tribal Council.

1.040 Jurisdiction.

(a) Territory.

The provisions of this Ordinance and all regulations adopted under it shall apply to the full extent of the sovereign jurisdiction of the Makah Tribe, including but not limited to the Makah Reservation and the Makah Tribe's usual and accustomed whaling places as provided in the Treaty of Neah Bay.

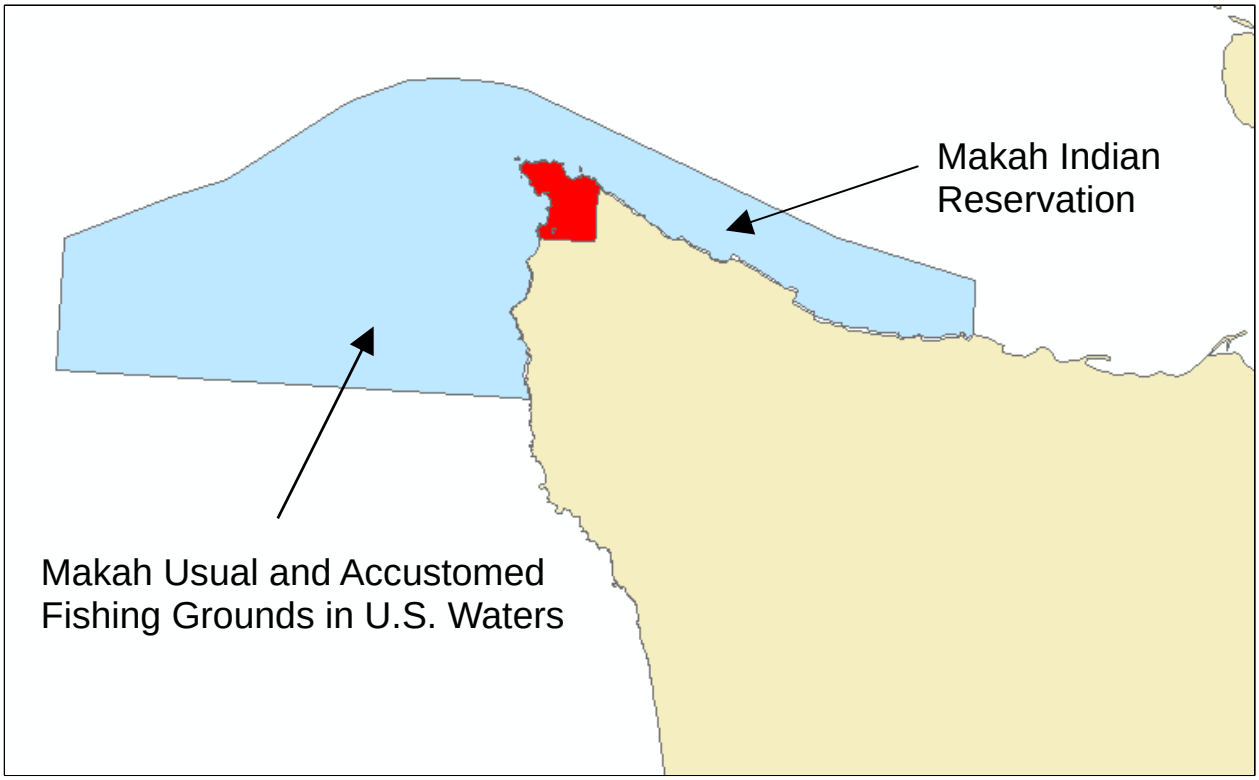

Figure 1: The Makah Tribe's adjudicated Usual and Accustomed Fishing Grounds in U.S. Waters.

(b) Persons.

The provisions of this Ordinance shall extend to all Tribal members who are exercising or purporting to exercise treaty whaling rights of the Makah Tribe while engaged in whaling, traveling to or from off-reservation areas on a whaling expedition, or any other activity regulated by this Ordinance.

1.050 General Closure.

All areas within the Tribe's jurisdiction are closed to whaling unless those areas are specifically opened by regulation. All times of the year are closed to whaling unless they are specifically opened by regulation. Areas and times opened by regulation are only opened to whaling in accordance with this Ordinance and all applicable regulations and permits.

Chapter 2. Definitions

2.010 Definitions.

The following terms have the meanings set forth below when they appear in this Ordinance, Makah whaling regulations and whaling permits, unless explicitly stated otherwise:

(a) "Calf" means any whale less than 1 year old.

(b) "Council" means the Makah Tribal Council.

(c) "Commission" means the Makah Whaling Commission.

(d) "Edible whale product" means whale meat or blubber. Edible whale products do not include whale products that are diseased, contaminated, or damaged in the course of the hunt.

(e) "Handicraft" is a term used in the Marine Mammal Protection Act and is not intended to denigrate the quality of work of Makah artists. As used in this Ordinance, the term "handicraft" means artwork and other items which are composed wholly or in significant part of non-edible whale products from a gray whale harvested under this Ordinance and Makah whaling regulations or from a

stranded gray whale, and which are individually produced, decorated or fashioned by a member.

(f) "Land" or "Landing," when used as a verb, means bringing a whale or any part of a whale onto land in the course of a whaling expedition.

(g) "Makah Fisheries" means the Makah Fisheries Management Department.

(h) "Member" means an enrolled member of the Makah Indian Tribe.

(i) "Non-edible whale product" means any whale product that is not an edible whale product.

(j) "Regulation" means any rule or regulation adopted by the Makah Tribal Council pursuant to this Ordinance.

(k) "Revocation of Whaling Privileges" means the loss of all rights and privileges to whale under this Ordinance and Makah whaling regulations until such time, if any, as whaling privileges are restored.

(l) "Stranded" means a whale that dies of causes other than a Tribal hunt or becomes live stranded and is floating or beach cast.

(m) "Strike" means any blow or blows delivered to a whale by a harpoon, lance, rifle, explosive device or other weapon which may result in death to a whale. When used as a verb, "Strike" means the act of delivering such a blow or blows to a whale. A harpoon blow is a strike if the harpoon penetrates and lodges in the whale. A harpoon that lodges in the whale counts as a strike even if the harpoon later pulls out of the whale. Any rifle shot which hits a whale is a strike. For purposes of determining strike limits, multiple strikes on a single whale shall count as a single strike.

(n) "Suspension of Whaling Privileges" means the loss of all rights and privileges to whale under this Ordinance and Makah whaling regulations for a period of time specified by this Ordinance, the Court or the Council.

(o) "Tribe" means and "Tribal" refers to the Makah Indian Tribe.

(p) "Tribal Court" or "Court" means the Makah Tribal Court.

(q) "Waste" means the taking of a whale subject to regulation under this Ordinance and Makah whaling regulations and allowing edible whale products to spoil or otherwise become unfit for human consumption or medicinal or spiritual use.

(r) "Wasteful manner" means a method of whaling that is not likely to result in the landing of a struck whale or that does not include all reasonable efforts to retrieve a struck whale.

(s) "Whale product" means any part of a whale, including blubber, meat, bones, whale oil, meal and baleen. The definition of whale products excludes handicrafts that are made from non-edible whale products.

(t) "Whale" in its verb form, and such derivatives as "whaling," means the scouting for, hunting, striking, killing, or landing of a whale.

(u) "Whaling captain" means the member in charge of a whaling team who holds a whaling permit issued by the Council under this Ordinance and Makah whaling regulations.

(v) "Whaling expedition" means a voyage in which a whaling team leaves port or shore for the purpose of whaling and returns to port or shore.

(w) "Whaling team" means a group of members under the control of a whaling captain who holds a whaling permit issued by the Council under this Ordinance and Makah whaling regulations.

Chapter 3. Whaling Administration

3.010 Makah Tribal Council as Administrator; Delegation of Authority.

The exercise of treaty whaling rights pursuant to this Ordinance shall be subject to the exclusive management and administration of the Makah Tribal Council, with the advice of Makah Fisheries and the Makah Whaling Commission as sought by the Council or otherwise provided for by this Ordinance. The Council may delegate all or part of its authority to manage and administer tribal whaling to Makah Fisheries and/or the Commission, provided that any action taken pursuant to such delegation of authority shall be subject to final approval by the Council

and provided further that such delegation may be revoked, modified or withdrawn at any time by the Council.

3.020 Regulations.

Prior to each whaling season and at such other times as it may find appropriate, the Council shall by a duly-enacted resolution adopt regulations as are necessary to implement the policy of the Tribe with respect to whaling, this Ordinance, and any cooperative agreement with the National Oceanic and Atmospheric Administration ("NOAA"). Such regulations shall be consistent with any applicable federal regulations promulgated under the Marine Mammal Protection Act. The regulations adopted pursuant to this provision shall address, but are not limited to, the following:

(a) Annual harvest quotas and strike limits; and

(b) Time and area restrictions.

The Council may impose additional limitations on the exercise of whaling rights through its issuance of whaling permits under Chapter 5, below.

3.030 Notice of Regulations.

Makah whaling regulations shall be adopted, filed and made available to the Commission, National Oceanic and Atmospheric Administration, Coast Guard and Marine Mammal Commission at least thirty (30) days prior to the opening date of the applicable whaling season to ensure adequate notice. All regulations shall be posted in appropriate places, including the Natural Resources Enforcement and Makah Fisheries offices, and otherwise made available to tribal members as specified by general regulations designated to give adequate notice.

3.040 Revocation or Suspension of Whaling Privileges.

In addition to judicially imposed penalties for violations of this Ordinance, Makah whaling regulations or the terms of a whaling permit, any member's whaling privileges may be revoked or suspended by the Council for good cause shown when the Council by duly-enacted resolution determines that such revocation or suspension will be in the best interest of the Tribe. "Good cause" for suspension or revocation shall include, but not be limited to, a conviction for

violating this Ordinance, Makah whaling regulations or a whaling permit, conviction of a Class AA or Class A offense under the Makah Law and Order Code, failure to appear in Makah Tribal Court as required for charges or a conviction under this Ordinance, disobeying Court orders including sentencing orders for charges or a conviction under this Ordinance, assault on a Natural Resources Enforcement Officer, other law enforcement officer or other tribal official, reckless disregard for the safety of others when whaling, and any actions that might jeopardize the Tribe's ability or opportunity to responsibly manage its whaling rights or to otherwise accomplish the purposes of this Ordinance. Prior to any such revocation or suspension the Tribal Council shall make necessary arrangements to ensure that the member affected is given adequate notice of the proposed revocation or suspension and an opportunity to be heard before the Council. This Section shall be construed to be in addition to and not in conflict with or in derogation of those sections of this Ordinance dealing with judicial penalties for violations.

Chapter 4. Enforcement

4.010 Natural Resource Enforcement Officers.

It shall be the duty of every tribal Natural Resources Enforcement Officer to enforce this Ordinance, Makah whaling regulations and whaling permits, and to this end all such officers shall be vested with such authority to the full extent of Tribal law. Natural Resources Enforcement Officers may issue citations or make arrests and seizures in accordance with this Ordinance and the Makah Law and Order Code. Officers may use such vessels and/or vehicles as are necessary to perform their duties. The Tribal Council may also, from time to time, appoint and deputize persons to assist Natural Resources Enforcement Officers in the performance of their duties.

4.020 Arrests for Criminal Offenses.

Natural Resources Enforcement Officers shall have the authority to make an arrest of any person whaling under this Ordinance or Makah whaling regulations or issue citations or summons or other appropriate forms to assure appearance in Court whenever such person is in violation of any provision of this Ordinance, Makah whaling regulations or the terms of a whaling permit.

4.030 Searches.

Natural Resources Enforcement Officers may conduct limited searches without warrant. These include inspection and searching of gear and vessels, and patting down the person of a whaler who is of the same sex as the officer.

4.040 Seizure of Whale and Gear.

Upon arrest or the issuance of a citation, a Natural Resources Enforcement Officer may seize the whale and parts of the whale which the officer has reasonable grounds to believe have been taken, killed, possessed or used by the alleged violator contrary to the provisions of this Ordinance, Makah whaling regulations or a whaling permit. In lieu of seizing the whale, the officer may direct the whaling captain to tow the whale to land. A Natural Resources Enforcement Officer may, in addition, seize any weapons, vessels or other paraphernalia which the officer has reasonable grounds to believe have been used in the commission of a violation of this Ordinance, Makah whaling regulations or a whaling permit. The Natural Resources Enforcement Officer shall prepare an inventory of all items seized, which shall be signed by the officer and, if known, the owner or possessor. A copy of the inventory shall be given to the owner or possessor, if known, and to the Commission. If the owner or possessor is not known, a reasonable attempt shall be made to locate him or her to provide a copy of the inventory.

4.050 Disposition of Seized Whale Products and Handicrafts.

If whale products or handicrafts are seized from a whaling captain, whaling team member or other tribal member, the Natural Resources Enforcement office shall dispose of the property in a manner consistent with applicable Tribal and federal law. The Natural Resources Enforcement office shall consult with the Council, Makah Fisheries and the National Oceanic and Atmospheric Administration prior to making a decision regarding the disposition of any seized whale products or handicrafts.

4.060 Disposition of Other Seized Property.

This section applies only to seized property other than whale products or handicrafts. After: (1) final disposition of any charges arising from the events which led to the seizure of property under Section 4.040 above; (2) satisfactory proof of ownership or rightful possession; and (3) payment of reasonable costs for retrieval and storage, the Natural Resources Enforcement office may release such seized property (except contraband) to the owner or rightful possessor. Any person claiming ownership of rightful possession of seized property who is unable to obtain its release from the Natural Resources Enforcement office may petition the Tribal Court for an order releasing the property. The Court shall order the release of seized property only in conformance with this Section, provided that the Court may order the release of such property prior to final disposition of the charges if the Court finds: (1) it would cause undue hardship not to release the property; (2) the property is not needed for evidence; and (3) the Court has received satisfactory assurances that the property will not be used in violation of this Ordinance, Makah whaling regulations, or any other Tribal law. In circumstances where the owner or rightful possessor of seized property is unknown, and the property is neither contraband nor necessary evidence, the Natural Resources Enforcement office shall post a notice at the tribal Natural Resources Enforcement office and other appropriate places to ensure adequate notice to members which describes the items seized, the location, date and time of seizure, and states that the items shall be forfeited to the Tribe unless claimed by the owner or rightful possessor within thirty (30) days of the date the notice is posted. The notice shall state the date and time by when, and location where, the property must be claimed, as well as the amount of any retrieval or storage costs that must be paid.

Chapter 5. Permits

5.010 Issuance; Possession by Whaling Captain.

No member may engage in whaling except under the control of a whaling captain who is in possession of a whaling permit issued by the Council. To be valid, a whaling permit must be in writing, approved by a majority of the Council, and signed by the Chairman of the Tribal

Council or his designee. All whaling permits issued by the Council shall incorporate all applicable requirements of this Ordinance and Makah whaling regulations. The Council may also include in all whaling permits any additional requirements the Council deems appropriate.

5.020 Contents of Permit.

Any whaling permit approved by the Council shall be issued only to a whaling captain certified by Makah Fisheries or the Commission, as designated by the Council pursuant to Chapter 6 below. The permit shall identify the date the permit is approved by the Council, the vessels that will participate in the hunt, the members and any alternates who will be part of the captain's whaling team, and the boundaries of the designated area in which hunting will be permitted.

5.030 Certification of Whaling Captain and Whaling Team Prior to Issuance.

The Council shall not approve a whaling permit without determining that the whaling captain, each whaling team member and any alternates identified in the permit have been certified by Makah Fisheries or the Commission, as designated by the Council pursuant to Chapter 6 below.

5.040 Notice to Federal Government.

The Council shall provide at least 24 hours advance notice to the National Marine Fisheries Service ("NMFS") and the United States Coast Guard ("USCG") prior to approving a whaling permit, provided that, if a NMFS observer is already present on the Makah Reservation, the Council shall provide at least 3 hours advance notice to NMFS and the USCG prior to approving a whaling permit.

5.050 Coordination with NMFS Observer and Coast Guard.

The whaling captain shall coordinate with any on-site NMFS observer, the Coast Guard and the Tribal observer prior to departing on a whaling expedition.

5.060 Termination.

A whaling permit shall terminate and become invalid when any one of the following events occurs: (1) the whaling team lands a whale; (2) the whaling team strikes a whale but is unable

to land it; (3) the whaling team has not struck or landed a whale within 10 days of the Council's approval of the permit; (4) the applicable whaling season ends; or (5) the Council determines, for any reason, to terminate the permit.

5.070 Determination of Need.

The Council will issue a whaling permit only after determining, based on the advice of the Commission, that there is an unmet traditional, subsistence or cultural need for whale products in the Tribal community.

Chapter 6. Training/Qualifications

6.010 Certification of Whaling Captain and Whaling Team.

The Council shall establish, with the advice of the Commission, certification guidelines and a certification process for whaling captains, harpooners, riflemen, safety officers, other whaling team members and any alternates. Makah Fisheries or the Commission, as designated by the Council, shall implement the certification guidelines and the certification process. The certification guidelines and the certification process shall ensure that every whaling captain and each member who serves on a whaling team has received adequate training to perform his assigned role on the team. Certification of riflemen and harpooners shall include a demonstration of proficiency and accuracy under simulated hunting conditions. Certification of safety officers shall include a demonstration of proficiency under simulated hunting conditions.

Chapter 7. Whaling Vessels, Equipment and Hunting Methods

7.010 Vessels.

A whaling team must include one or more canoes, one or more chase boats, and one or more support boats.

7.020 Whaling Canoe.

All canoes used in whaling must be at least 30 feet in length and manned by a harpooner and at least six paddlers.

7.030 Chase Boat.

All chase boats used in whaling must be at least 18 feet in length. Each chase boat shall be manned by a pilot, rifleman, and harpooner. At least one chase boat shall be manned by a diver. The diver or an additional whaling team member shall act as a safety officer. One boat shall be equipped with a navigation system capable of precisely fixing the vessel's position on the water. If the chase boat is not powered by an engine large enough to tow an adult whale to port, it must be accompanied by at least one support boat with this capability.

7.040 Harpoons.

All whaling harpoons must be connected to one or more floats and bear a permanent distinctive mark identifying the whaling captain who is in charge of the whaling team using the harpoon. The whaling harpoon used for the initial strike must be equipped with a toggle point.

7.050 Rifle.

The rifle used in whale hunts shall be an adequate very high-powered rifle (.50 caliber or higher), approved by the Council, with the advice of the Commission, for use in whaling. The whaling team shall have at least two rifles available and sufficient ammunition to dispatch a whale.

7.060 Striking the Whale.

The first strike made upon a whale shall be made by the harpooner and shall affix one or more floats to the whale. The chase boat will pursue the whale, and the rifleman aboard the chase boat will kill the whale as expeditiously as practicable with rifle shots directed at the whale's brain stem and upper spinal cord.

7.070 Prohibition on Striking Whale Calf or Whale Accompanied by a Calf.

No member may strike a whale calf or a whale accompanied by a calf or calves.

7.080 Prohibition on Striking Whales Other Than Gray Whales.

No member may strike a whale that is not a gray whale (*Eschrictius robustus*).

7.090 Discharging the Rifle; Role of Safety Officer.

The rifleman on the chase boat shall not discharge his weapon until authorized to fire by the safety officer. The safety officer will not authorize the discharge of the rifle unless it is safe to do so.

7.100 Visibility – Suspension of Hunt.

The whaling captain shall suspend the hunt, if the safety officer determines that visibility is inadequate to ensure a safe hunt.

7.110 Towing the Whale.

Upon the death of a whale, the chase boat crew shall secure the whale for towing to shore. The whale will be expeditiously towed to shore by chase and/or support boats.

7.120 Best Efforts to Land Whales; Prohibition on Whaling in a Wasteful Manner.

A whaling captain shall make best efforts to land every whale that is struck, while minimizing risk to human life and property. It is a violation of this Ordinance for a whaling captain and whaling team to conduct a hunt in a wasteful manner.

Chapter 8. Area Restrictions

8.010 Usual and Accustomed Grounds – Pacific Ocean Waters.

All whaling shall occur within the portion of the Makah Tribe's adjudicated usual and accustomed fishing grounds in U.S. waters to the west of a line connecting the following points: the northwestern tip of Cape Flattery; the Tatoosh Island Lighthouse; the buoy adjacent to

Duntze Rock; and Bonilla Point on Vancouver Island, provided that a whale struck inside the area specified by this Section and a permit may be pursued to an area that is otherwise closed to whaling.

8.020 Area Restricted by Permit.

Within the area open to whaling under Section 8.010 above, whaling may be confined to an area designated by the Council in each whaling permit.

8.030 Closed Area under Weapons Control Ordinance.

A whale shall not be struck within the "closed area" designated in Section 10.5.02 of the Makah Law and Order Code (Weapons Control Ordinance No. 43 enacted 9/5/89) or east of the "closed area" to a line extending from the southern end of Waadah Island to Baada Point.

Chapter 9. Use of Meat, Whale Products and Handicrafts

9.010 Local Consumption.

Whale products harvested pursuant to this Ordinance and Makah whaling regulations or collected from a stranded gray whale shall be used exclusively for local consumption and/or ceremonial purposes and may not be sold or offered for sale. No member may receive money for participation in whaling.

9.020 Handicrafts - Sale.

Notwithstanding Section 9.010 above, handicrafts made from non-edible whale products may be sold or offered for sale only within the United States and in accordance with the requirements of this Ordinance and all federal regulations.

9.030 Handicrafts – Marking and Registration.

The Tribe shall develop and implement a registration system to ensure the authenticity of Makah whale handicrafts. Prior to any sale pursuant to Section 9.020 above, all Makah whale handicrafts must be marked and entered in the Tribe's official registry of whale handicrafts. All

handicrafts must bear a distinctive marking approved by the Council. For the official registry, the Tribe will collect and maintain records regarding the following information for each handicraft: (a) artist(s); (b) whale product(s) used; (c) a brief description, including subject matter and approximate size; and (d) registration number. The Tribe shall issue a certificate for each handicraft that must accompany any sale pursuant to Section 9.020. The official registry may be inspected upon request by NOAA.

9.040 Prohibition on Wasting.

A whaling captain and whaling team shall not, upon landing a whale, cause it to go to waste.

9.050 Stranded Whales.

Members may collect whale products from stranded gray whales in the Makah usual and accustomed fishing grounds in U.S. waters for subsistence and ceremonial use and for making handicrafts, but such collection may not occur until Makah Fisheries has had the opportunity to examine the carcass and take samples and has confirmed that the whale is a gray whale and that it did not die from a Tribal hunt. Makah Fisheries will provide timely notice to the National Marine Fisheries Service of all known whale strandings in areas within the Tribe's jurisdiction.

Chapter 10. Monitoring and Reporting

10.010 Whaling Observers.

A representative of Makah Fisheries, or another Tribal department as designated by the Council, will accompany each whaling team as a Tribal observer. Upon request of the National Marine Fisheries Service, the Tribal observer will permit an additional observer from the National Marine Fisheries Service to observe the hunt.

10.020 Responsibility of Tribal Observer – Recording Data from the Hunt.

The Tribal observer shall be responsible for recording:

(a) for each attempted strike,

(1) the time, date and precise location of the attempted strike(s);

(2) whether the whale is landed;

(3) if the whale is not landed, the circumstances associated with the attempted striking of the whale and an estimate of whether the animal suffered a wound that might be fatal;

(b) for each whale landed,

(1) the body length (as measured from the point of the upper jaw to the notch between the tail flukes);

(2) the extreme width of the flukes

(3) the sex of the whale; and

(4) the length and sex of any fetus in the landed whale;

(c) the time interval between the initial strike and the death of the whale; and

(d) such other information as NOAA regulations require.

10.030 Responsibility of Tribal Observer – Reporting.

The Tribal observer shall be responsible for compiling and transmitting such reports as are required under any regulations promulgated under the Marine Mammal Protection Act and any cooperative agreement with the National Oceanic and Atmospheric Administration to the Council.

10.040 Joint Annual Report.

Following a season in which whaling has occurred, Makah Fisheries shall prepare a written report compiling all of the data for the season recorded by the Tribal observer(s) under Sections 10.020 and 10.030 above, as well as any additional data provided by National Marine Fisheries Service personnel, and transmit such report to the Council and the appropriate representative of the National Marine Fisheries Service within thirty (30) days of the last day of the season.

10.050 Collection of Specimen Materials.

Makah Fisheries may collect specimen materials from all landed whales, including but not limited to ovaries, ear plugs, baleen plates, stomach contents, and tissue samples. A

representative of the National Marine Fisheries Service shall have reasonable access to all landed whales to collect specimen materials.

10.060 Photography of Landed Whales.

Makah Fisheries shall photograph all landed whales and transmit a copy of such photos to the National Marine Fisheries Service.

10.070 Observer Access.

Makah Fisheries, and the representative of the National Marine Fisheries Service as appropriate, shall have adequate access to landed whales to comply with the requirements of this Chapter. No person shall interfere with the actions necessary to comply with this Chapter.

Chapter 11. Violations

11.010 Responsibility of Whaling Captain and Whaling Team; Strict Construction.

It is the responsibility of every member engaging in whaling to know the contents of this Ordinance, Makah whaling regulations and the permit under which the member is whaling. This Ordinance, Makah whaling regulations and the terms of a whaling permit shall be strictly construed against such persons, taking into account the importance of the Tribe's management of the treaty whaling right and the whaling resource and the purpose and intent of the Council in enacting this Ordinance. Copies of this Ordinance and current Makah whaling regulations shall be available for review in the Makah Fisheries and Natural Resources Enforcement offices. Any member shall have the opportunity to have the Ordinance and regulations read to him or her upon request.

11.020 Criminal Offenses.

(a) Any member who whales without authorization under a valid whaling permit is guilty of a Class AA Offense under the Makah Law and Order Code.

(b) Any member who whales in violation of a time, area or species provision of this Ordinance, Makah whaling regulations, or the terms of a whaling permit is guilty of a Class AA Offense under the Makah Law and Order Code.

(c) Any member who strikes a whale calf or whale accompanied by a calf and who knows or should know that such whale is a calf or whale accompanied by a calf, is guilty of a Class AA Offense under the Makah Law and Order Code.

(d) Any member who violates a provision of this Ordinance, Makah whaling regulations or the terms of a whaling permit that is not specified in Sections 11.020(a) through 11.020(c) is guilty of a Class A Offense under the Makah Law and Order Code.

11.030 Liability of Whaling Captain.

A whaling captain shall be deemed liable if a member of a whaling team identified in a permit issued to the whaling captain, or otherwise under his control, violates a provision of this Ordinance, Makah whaling regulations or the terms of the whaling permit.

Chapter 12. Penalties

12.010 Law and Order Code Penalty.

(a) Any member convicted by the Tribal Court of an offense in Sections 11.020(a) through 11.020(c) shall be sentenced pursuant to the penalties provided for Class AA criminal offenses under Section 5.8.01 of the Makah Law and Order Code.[1]

(b) Any member convicted by the Tribal Court of an offense in Sections 11.020(d) or 11.020(e) shall be sentenced pursuant to the penalties provided for Class A criminal offenses under Section 5.8.02 of the Makah Law and Order Code.[2]

12.020 Suspension of Treaty Privileges.

(a) For any member convicted by the Tribal Court of an offense in Sections 11.020(a) through 11.020(c), the Court shall suspend the member's treaty fishing, hunting and

[1] Section 5.8.01 of the Makah Law and Order Code currently provides that a Class AA offense is punishable by a fine not to exceed $5000 and imprisonment not to exceed 12 months.

[2] Section 5.8.02 of the Makah Law and Order Code currently provides that a Class A offense is punishable by a fine not to exceed $500 and imprisonment not to exceed 6 months.

whaling privileges for a minimum of three (3) years and a maximum of five (5) years. The length of the suspension of treaty privileges is not required to be identical for all treaty privileges. The Court may not impose a suspended sentence for this portion of the penalty.

(b) For any member convicted by the Tribal Court of an offense in Sections 11.020(d) or 11.020(e), the Court may suspend the member's treaty fishing, hunting and whaling privileges for a maximum of five (5) years. The length of the suspension of treaty privileges is not required to be identical for all treaty privileges.

12.030 Commission Disqualification.

(a) Any member convicted by the Tribal Court of an offense in Sections 11.020(a) through 11.020(c) shall be ineligible to hold a position as a member or alternate of the Commission for ten (10) years and shall be permanently ineligible to serve as an officer of the Commission.

(b) Any member convicted by the Tribal Court of an offense in Sections 11.020(d) or 11.020(e) shall be ineligible to hold a position as a member or alternate of the Commission for two (2) years and shall be permanently ineligible to serve as an officer of the Commission.

12.040 Sentencing Considerations.

In determining the sentence, the Court shall take into account the harm caused by the person to the Tribe, the Tribe's treaty right and Tribal resources. The Court may seek written recommendations with respect to these factors from the Council and the Commission.

Chapter 13. Miscellaneous Provisions

13.010 Amendments.

The Council may amend this Ordinance from time to time as new information becomes available from Makah Fisheries, the Commission, the National Oceanic and Atmospheric Administration and other reliable sources, provided that the requirements of the Ordinance shall comply with the applicable International Convention for the Regulation of Whaling ("ICRW")

Schedule Amendment, any cooperative agreement between NOAA and the Council, and all applicable federal and Tribal law.

13.020 Severability.

The provisions of this Ordinance are severable. If any provision of this Ordinance or its application to any person or legal entity or circumstances is held invalid, the reminder of this Ordinance, or the application of the provision to other persons or legal entities or circumstances, shall not be affected.

Appendix C

Responses to Frequent and Substantive Comments on the Makah Tribe Request to Hunt Gray Whales

Responses to Frequent and Substantive Comments on the 2015 Draft Environmental Impact Statement (DEIS) and the 2022 Supplemental DEIS on the Makah Tribe Request to Hunt Gray Whales

Table of Contents

Introduction

On March 13, 2015, the West Coast Region of the National Marine Fisheries Service (NMFS) released a Draft Environmental Impact Statement (DEIS), pursuant to the National Environmental Policy Act (NEPA), concerning the Makah Indian Tribe's February 2005 request for a waiver from the Marine Mammal Protection Act (MMPA) to resume limited hunting of eastern North Pacific (ENP) gray whales for ceremonial and subsistence purposes. We made the DEIS available for public review for 90 days (80 FR 13373, March 13, 2015) and, in response to several stakeholder requests, extended the initial public comment period by an additional 50 days (80 FR 30676, May 29, 2015). In April 2005, we held two public meetings, in Seattle and Port Angeles, Washington on the DEIS (80 FR 14912, March 20, 2015).

On July 1, 2022, the West Coast Region of NMFS released a Supplemental Draft Environmental Impact Statement (SDEIS) after determining that the purposes of NEPA concerning the Makah Tribe's 2005 request would be furthered by doing so (40 CFR § 1502.9(d)). We made the SDEIS available for public review for 45 days (87 FR 39517, July 1, 2022) and, in response to several stakeholder requests, extended that comment period as well by an additional 60 days (87 FR 49827, August 12, 2022). We briefly reopened the comment period after additional stakeholder requests for another 7 days (87 FR 65202, October 28, 2022).

We received more than 57,000 comments on the 2015 DEIS and 47 comments on the 2022 SDEIS by mail, fax, email, and submissions to www.regulations.gov. All written comments, regardless of submission format, were published under Docket ID: NOAA-NMFS-2012-0104 on www.regulations.gov. Over 99 percent of comments were submitted as form letters. Individual commenters included state and federal entities, tribal governments, nonprofit organizations and interested individuals from the United States and around the world.

NEPA implementing regulations require agencies to consider and respond to public comments. After carefully reviewing the comments received on the DEIS and SDEIS, we have updated the analysis in the FEIS to include the most recent information available and improved our analysis where necessary. In preparation for the ALJ hearing, we drafted a response to frequent comments on the 2015 DEIS (see Appendix E), compiled a separate table with all comments received on the DEIS (see Appendix F), and submitted our responses to those comments as part of the hearing record. We have compiled a separate table with all comments received on the SDEIS (see Appendix D). This document responds to frequent and substantive comment received on the 2015 DEIS and the 2022 SDEIS. In this document, we bin frequent and substantive comments received by topic and provide detailed responses to them.

1. Potential for a hunt to cause pain or suffering to whales

Some commenters on the DEIS and SDEIS object to a Makah gray whale hunt on moral or emotional principles, stating that a hunt is cruel and would subject whales to unnecessary suffering. Several commenters assert that no whale hunt (including the 1999/2000 Makah hunt) is humane, that the Makah Tribe's proposed hunting methods are not humane, that the inexperience of the Makah whalers make it less likely that any hunt would be humane, and/or that the DEIS and SDEIS do not provide adequate information to demonstrate that hunting would be humane. Some commenters also point to the prolonged death of a gray whale in the unauthorized 2007 hunt by Makah tribal members as evidence of the inhumanity of a hunt and/or the lack of skill of Makah tribal hunters. Others commented on the weapons used, recommending the use of explosive projectiles or particular caliber rifles.

Response

We understand that hunting in general—and whale hunting in particular—can elicit strong reactions. The FEIS evaluates and describes those likely human reactions under the different alternatives in Subsection 4.8, Social Environment. Nevertheless, Section 101(a)(3)(A) of the MMPA provides for a waiver of the moratorium on take for hunting, among other actions, if certain conservation standards are met. The FEIS does not attempt to resolve the question of whether any particular method of hunting would meet the humaneness test of MMPA Section 104, which defines 'humane' as "that method of taking which involves the least possible degree of pain and suffering practicable to the mammal involved."

If a waiver of the moratorium is authorized, Section 104 of the MMPA provides for a separate permit process to evaluate a subsequent permit application addressing the method of hunting. Section 104 of the MMPA provides that, before issuing a permit, NMFS must determine that the hunting method is 'humane.' We prepared the FEIS to assist in our review of the Makah Tribe's request to waive the MMPA moratorium and authorize the Tribe to hunt ENP gray whales, including the evaluation of any permit application that might be submitted by the Makah Tribe in the future if the take moratorium is waived and regulations are issued. To inform the determination at the permit stage, the FEIS provides factual information and analyzes in detail the impact of a hunt on individual whales under a range of alternatives. This includes analyzing weapon type, manner and time to death, and the feasibility of alternative methods of hunting (FEIS Subsection 4.4.2.5, Welfare of Individual Whales – Method of Striking and Killing; Time to Death; Hunting Efficiency). The FEIS also includes, as an Appendix, the Makah Tribe's 2013 Ordinance to govern any authorized hunt and provide for training and a certification processes for the whaling team and rifleman (FEIS Appendix B). Adopted by the Makah Tribal Council in 2013, the Whaling Ordinance includes provisions, such as required training for hunters, to improve the

humaneness of a hunt (FEIS Subsection 2.3.2.2.12, Other Environmental Protection Measures). The FEIS concludes that these proposed measures could help mitigate impacts to the welfare of individual whales (see also Substantive Comment No.22), as could improved enforcement of the moving exclusionary zone and allowing a hunt during better weather conditions (FEIS Subsection 3.4.3.5.4, Method of Killing and Time to Death). These training requirements should also help mitigate concerns that the inexperience of Makah hunters could result in a less humane hunt.

To help evaluate potential scenarios regarding the manner and time to death of a whale killed in a Makah tribal hunt, the FEIS examines the May 1999 hunt. It also compares the results of that hunt to the results from Chukotkan gray whale hunts and concludes that it is reasonable to expect that average time to death in a Makah hunt using a .50 or .577 caliber rifle as the killing weapon would be shorter than average time to death in the Chukotka Native hunt because the Makah Tribe would use a higher caliber rifle, which would kill a gray whale more effectively than a lower caliber rifle used by the Chukotka Native hunters.

Some commenters cite the unauthorized hunt by Makah tribal members in 2007 (see FEIS Subsection 3.4.3.5.4, Method of Killing and Time to Death) as evidence that the hunt is not humane. The unauthorized hunt is not predictive of the likely manner and time to death of whales in a possible future hunt because the unauthorized hunt did not follow any of the procedures recommended by the Tribe in its request (such as training of the shooter), the main killing weapon was lost overboard, and the Coast Guard intervened and stopped the hunt.

During review of the permit application, NMFS would also seek and include relevant information developed by the IWC Working Group on Whale Killing Methods and Associated Welfare Issues that regularly reviews whale killing methods as the science and methodology is evolving (IWC 2018a). This Working Group, in which the United States participates, regularly reviews data on the Chukotkan Russian gray whale and Alaskan bowhead hunt. The IWC has focused on reducing the time to death of a whale (i.e., reducing the amount of time between the strike and death of a whale) to improve the humaneness of whaling (IWC 2004; IWC 2007; IWC 2012a), while taking into account hunter safety. Our review of this work will help ensure that permits incorporate best available science and methods related to humane hunts that is available at the time of permit review. As required under the MMPA, the public would be provided with an opportunity to review and comment on the Tribe's permit application, including the method of hunting proposed by the Tribe, prior to NMFS' decision whether to issue a permit.

2. Aboriginal subsistence whaling (ASW) status of the Makah Tribe and U.S. request to the IWC on behalf of the Makah Tribe.

Several commenters on the DEIS assert that the Makah Tribe does not qualify under the ASW provisions of the International Convention for the Regulation of Whaling (ICRW), or the Whaling Convention Act (WCA), which is the domestic law implementing the ICRW. Commenters raise a number of arguments including the 70-year hiatus in the Tribe's whaling tradition, the lack of a 'subsistence need,' and the process by which the International Whaling Commission (IWC) allocated the United States an ASW quota for ENP gray whales. One commenter states: "any claim of an ASW right must be legitimate, substantiated and incontrovertible," citing the position of the IWC that the ASW exception should not undermine the conservation of whales.

Response

These assertions have been routinely raised and reviewed in public forums, facilitated by NMFS and the State Department, to hear from interested parties and to develop the United States' positions before the IWC since 1996 when the United States first submitted a request and needs statement on behalf of the Makah Tribe for international review pursuant to the ICRW and domestically pursuant to the Whaling Convention Act. The United States has supported the Makah Tribe's request at the IWC, and the IWC has repeatedly reviewed and approved catch limits for ENP gray whales in response to the joint U.S.-Russia request for " aborigines or a Contracting Government on behalf of aborigines, and then only when the meat and products of such whales are to be used exclusively for local consumption by the aborigines" (IWC 2018b). The current 7-year harvest limit runs through 2025 and is for 980 ENP gray whales with an annual cap of 140 whales. A bilateral agreement between the United States and the Russian Federation sets overall and annual limits for the two countries (Fominykh and Smith 2023). The FEIS describes the position taken by the United States on this issue, which is that the Tribe does qualify within the meaning of the 1946 ICRW (United States 1996). The United States has also consistently taken the position that the Makah Tribe are qualified under the current IWC definition of aboriginal subsistence whaling that was agreed by the Commission in 1982:

Definitions for aboriginal subsistence whaling (IWC 1982)

1) Aboriginal subsistence whaling means whaling for purposes of local consumption carried out by or on behalf of aboriginal, indigenous or native peoples who share strong community, familial, social, and cultural ties related to a continuing traditional dependence on whaling and on the use of whales.

2) Local aboriginal consumption means the traditional uses of whale products by local aboriginal, indigenous or native communities in meeting their nutritional, subsistence and cultural requirements. The term includes trade in items which are by-products of subsistence catches.
3) Subsistence catches are catches of whales by aboriginal subsistence whaling operations.

The current comments provide no new information or analysis to support their assertions. The FEIS details the factors supporting the U.S. determination that the Makah Tribe's request meets the ICRW standards for aboriginal subsistence whaling as articulated by the IWC (FEIS Subsection 1.4.1.2.2, Overview of Requests for ENP Gray Whales on Behalf of the Makah):

> "United States delegates and Makah representatives responded that the Makah Tribe had continued aspects of its whaling tradition through names, dance, songs, and other cultural traditions (IWC 1997; United States 1996). The United States also noted that nutritional need is a factor in considering and setting aboriginal subsistence whaling catch limits, but not a threshold requirement. United States delegates used the example of the IWC setting a catch limit for the bowhead stock for many years after considering the United States' requests on behalf of the Alaska Natives, even though the Nutrition Panel at the 1979 workshop for aboriginal subsistence whaling of bowhead concluded that nutritional needs of Alaska Natives could be met through local subsistence or western-type foods (IWC 1979b; United States 1996). Moreover, the Makah needs statement (Renker 1996) had demonstrated a continued subsistence reliance on traditional marine foods available to the Makah, and a nutritional need based on poverty and economic conditions on the Makah Reservation (Renker 1996; United States 1996). The United States noted that federal agents in the last 5 decades had actively prevented Makahs from consuming and utilizing whales that drifted onto Makah beaches, by burying or burning the drift whales and by threatening Makah members, who tried to access the products, with jail and other federal sanctions (United States 1996). As late as the 1970s, federal agents were still entering Makah households and searching freezers for the presence of marine mammal products (United States 1996)."

The FEIS also describes the process at the IWC by which the United States requested and received an ASW quota on behalf of the Makah Tribe, including U.S. actions at the 1996 IWC meeting, where some delegates opposed the U.S. request for an ASW quota on behalf of the Makah Tribe (Subsection 1.4.1.2.2, Overview of Requests for ENP Gray Whales on Behalf of the Makah):

> "At the annual meeting of the IWC in 1996, the United States, on the Makah's behalf, requested that the IWC revise the Schedule to set a catch limit for the ENP gray whale stock of 20 ENP gray whales over 5 years (with no more than five in any one year) from 1997 through 2000. At the Aboriginal Subsistence Whaling Subcommittee meeting, many delegates supported the United States' request. Other delegates indicated they would vote against the proposal. One reason given for this opposition was that the United States did not ask the Russian Federation to share the existing 1995 to 1997 catch limit of 140 ENP gray whales per year, which was based on the cultural and nutritional needs of the Chukotka Natives (IWC 1997; 63 FR 16701, April 6, 1998). Instead, the United States adhered to a prior position that each contracting government requesting a revision to the Schedule for aboriginal subsistence whaling catch limits must submit its own proposal before the IWC (IWC 1997; 63 FR 16701, April 6, 1998). Opponents noted that granting the United States' request would increase the total ENP gray whale catch limit beyond what had already been set by the IWC in paragraph 13(b)(2) of the Schedule (IWC 1997). At the 1996 meeting, the Russian Federation had also requested a catch limit of five bowhead whales a year, but withdrew its request when a consensus could not be reached among delegates. The bowhead stock catch limit was already set for the United States and was not shared with Russia (IWC 1997).
>
> Another reason for the opposition was that some delegates questioned whether the Makah had a "continuing traditional dependence" on whaling (IWC 1997), a component of the working definition for aboriginal subsistence whaling developed by the 1981 *Ad Hoc* Technical Working Group (Subsection 1.4.1.2.1, Relevant Overview of Requests for Bowhead Whales on Behalf of Alaska Natives). The delegates noted that the Makah had not hunted gray whales since the 1920s (IWC 1997)."

The U.S. delegation responded to this concern, as noted above, that "the Makah Tribe had continued aspects of its whaling tradition through names, dance, songs, and other cultural traditions." (FEIS Subsection 1.4.1.2.2, Overview of Requests for ENP Gray Whales on Behalf of the Makah)

Before its actions at the IWC, the U.S. delegation conducted an internal review and a public review, as it does before making any request to revise catch limits in the IWC schedule (e.g., 83 FR 33210, July 17, 2018). As described in the FEIS (Subsection 1.2.4.1.4, United States' IWC Interagency Consultation):

> "When the United States receives a request from a Native American tribe to whale for subsistence purposes, NMFS' Office of International Affairs, Trade, and Commerce, the United States Commissioner to the IWC, and the Department of State first review the request. The United States Commissioner may also consult with other federal agencies as appropriate. Before each IWC meeting, the United States Commissioner presents the draft United States position on whaling issues, including proposals to revise aboriginal subsistence whaling catch limits, to the public at the IWC Interagency Committee meeting. These interagency meetings take place before each full meeting of the IWC, in the Washington D.C. area, and they are open to the public with an interest in whaling, except for individuals representing foreign interests. Representatives of environmental and animal rights groups, Native American groups, sustainable use groups, and other concerned stakeholders typically attend. When relevant, Makah whaling issues have been discussed at public IWC Interagency meetings since May of 1995."

We agree with the IWC position and with the comment that ASW claims should meet certain standards. To that end, the United States has promoted IWC efforts to standardize need statements and better understand the relationship between needs and consumption patterns for ASW hunts (see, for example, the report of the meeting of the Aboriginal Subsistence Whaling Working Group - IWC/67/ASW/Rep/01 (IWC 2018c)).

The Makah Tribe's request for MMPA authorization to hunt whales refers to the international catch limit authorized by the IWC under the ICRW (IWC, 2018a), even though the MMPA has no eligibility requirement similar to the ICRW's ASW requirement. If NMFS waives the MMPA take moratorium for ENP gray whales and issues regulations governing a tribal hunt, the Makah Tribe and NMFS will need to complete procedures established in domestic law that implements the ICRW, the WCA and its implementing regulations at 50 CFR Part 230. Any authorization granted under the WCA to allocate a domestic catch limit for ENP gray whales would need to be consistent with the IWC schedule and bilateral agreement between the United States and the Russian Federation.

3. Makah Tribe's desire to revive its whaling tradition

Several commenters assert the Tribe does not have a cultural or subsistence need for whale products. This argument is made both to support a claim that the Tribe does not qualify for an ASW quota through the IWC (Substantive Comment No. 2) and to support arguments against the Tribe's waiver request. These arguments include that whaling is outdated and anachronistic, no longer a central aspect of Makah culture and tradition, and unlikely to benefit the Tribe culturally, spiritually, materially or otherwise. They also

question surveys of tribal members used by the Makah Tribe to support their request and question the objectivity of anthropologists (Drs. Renker and Braund) conducting surveys and/or assessments of tribal views on the resumption of whaling. Several commenters assert that the right to whale is not guaranteed by the Treaty of Neah Bay (Substantive Comment No. 8). A number of commenters also state that authorization of a tribal hunt would circumvent the protections of the MMPA (Substantive Comment No. 17).

Response

The FEIS acknowledges that whale hunting under the action alternatives would inspire a wide range of feelings, including sorrow, frustration, and anger, among persons and groups who oppose the hunt (see Subsections 3.8.3.3 and 4.8.2.3, Other Individuals and Organizations). Although whaling may seem outdated to some people, the Makah Tribe, as a sovereign nation, decides which cultural traditions it pursues, within the bounds of applicable law.

Regarding the assertion that whaling is no longer a central aspect of Makah culture and tradition, the FEIS describes the U.S. position that whaling has continued to be a part of various Makah cultural traditions (Subsection 1.4.1.2.2, Overview of Requests for ENP Gray Whales on Behalf of the Makah, which is quoted above in response to substantive comment No.2). The Makah Tribe asserts that a revival of tribal culture is necessary to combat social ills and that a resumption of whaling is necessary to pursue cultural revival (Makah 2005a). The FEIS concludes that the hunting and harvest of gray whales under all action alternatives are likely to have beneficial impacts on the Tribe's cultural identity, including its traditional knowledge and activities and its spiritual connection to whaling.

We disagree with comments questioning the objectivity of anthropologists Dr. Ann Renker and Dr. Stephen Braund, both of whom provided valuable information for the FEIS regarding the history, culture, and significance of Makah whale hunts that support the U.S. position noted above. Dr. Renker has lived on the reservation for many years, conducted extensive research on the Makah Tribe since the 1980s, and served for several years as the Executive Director of the Makah Cultural and Research Center. Since 1996, Dr. Renker has conducted four randomized household whaling surveys of Makah tribal members utilizing consistent methodology over time. A detailed description of the methods of the surveys can be found in Appendix two of Renker (2018). These surveys formed the basis of four needs statements prepared by the Makah Tribe for the IWC. The United States has adopted the four needs statements as part of its joint request with Russia for a gray whale quota, and the IWC's Aboriginal Subsistence Whaling Sub-committee has consistently accepted these needs statements. To provide context for Dr.

Renker's household surveys, the FEIS includes a discussion of the limitations of the data from the surveys.

For nearly four decades Dr. Braund has conducted dozens of anthropological and cultural resource assessments on Native American communities, and he visited the Makah reservation and interviewed tribal members as part of our NEPA assessment. Dr. Braund also reviewed Dr. Renker's work and included references to it in his report, indicating he found Dr. Renker's work credible. We also retained cultural anthropologist Dr. Kennedy to review our presentation of Dr. Renker's work and provide comments. Dr. Kennedy did not find any major flaws with the analysis conducted by Dr. Renker or our interpretation of that analysis. The names of both of these cultural anthropologists appear in the list of preparers.

The FEIS discusses the social or cultural effects of authorizing or not authorizing a Makah whale hunt as, for example, this passage from Subsection 4.10.3.2.5, Cultural Identity:

> "Under Alternative 2, Makah whale-hunting rituals, spiritual training, songs, dances, and ceremonial activities would likely increase compared to the No-action Alternative and would regularly recur, thus reinforcing Makah cultural identity. The opportunity under Alternative 2 to regularly harvest, process, share, and consume whale products could lead to increased communal activities and an increase in tribal members' sense of community. The whale-hunting ceremonies that whalers and family members would follow for the hunt could provide the Makah with an additional social framework, which could contribute to social and spiritual community stability."

The FEIS also describes the subsistence effects to tribal members of authorizing or not authorizing a whale hunt (Subsection 4.10.3.2.2, Subsistence Use). Although tribal members may have access to other food sources, the FEIS concludes that the ability to hunt whales would increase the Tribe's opportunities to pursue subsistence practices and increase the satisfaction of tribal members as a result of those opportunities.

In the Treaty of Neah Bay of 1855, the Makah Indian Tribe secured the right to hunt whales. Treaties with Indian Tribes are federal law, coequal with all other federal law. Regarding legal arguments about the role and scope of the Treaty of Neah Bay in evaluating application of the MMPA to the Tribe's gray whale hunt, the Ninth Circuit stated in *Anderson v. Evans* that "[u]nlike other persons applying for a permit or waiver under the MMPA the Tribe may urge a treaty right to be considered in the NMFS's review of the

application submitted by the Tribe under the MMPA." *Anderson v. Evans*, 371 F.3d 475, 501 n.26 (9th Cir. 2004). To inform future decision making under the MMPA, the FEIS describes the treaty and issues surrounding its negotiation as context for the examination and analysis of effects of alternatives on the human environment. The FEIS describes other relevant federal laws also for background and context. See also the responses below to substantive comment No. 8 regarding the Treaty of Neah Bay and substantive comment No. 17 regarding lawfulness of a waiver.

The Makah Tribe is seeking a waiver of the MMPA take moratorium in accordance with the Ninth Circuit's decision in *Anderson v. Evans*, and as allowed under Section 101(a)(3)(A) of the MMPA. The FEIS describes the waiver process and requirements in more detail in Subsections 1.2.3.3, Section 101(a)(3)(A)—Waiver of the Take Moratorium, and 3.17.3.1, Waivers of the MMPA Take Moratorium. NMFS is responding to the Tribe's request through the legal processes of the MMPA. Thus, we disagree with the comment that a waiver would circumvent the protections of the MMPA.

4. Precedential effect of waiver internationally and domestically

Several commenters on the DEIS assert that if NMFS waives the MMPA take moratorium and authorizes a tribal hunt, it will lead to increased requests for and take of marine mammals, including whales, in the United States and/or increased whaling worldwide. These comments included:

- Future requests from the Makah Tribe to hunt other species (e.g., delisted humpback whale stocks).
- Requests from other coastal tribes that historically whaled.
- First Nations in Canada being prompted to resume whaling.
- Precedential effects on the efforts by Japan to promote small-type coastal whaling by traditional Japanese peoples, which commenters assert is not adequately addressed in the DEIS.

Members of the public recently submitted additional comments regarding a case in which the Ninth Circuit Court of Appeals held that historic whaling by the Quinault and Quileute Tribes counted as "fishing" for purposes of interpreting their treaties and establishing their usual and accustomed (U&A) fishing areas (*Makah Indian Tribe v. Quileute Indian Tribe*, 873 F.3d 1157 (9th Cir. 2017), *cert. denied*, No. 17-1592, 2018 WL 2364652 (U.S. Oct. 1, 2018)). These commenters state that the Court's decision could renew the interest of those tribes to resume whaling. One commenter suggests that other tribes have not requested MMPA waivers as a strategic maneuver in support of the Makah Tribe's request.

Response

The FEIS examines the potential for authorization of a gray whale hunt to have precedential effects on hunts for marine mammals in the United States and whaling world-wide (Subsection 4.17, Regulatory Environment Governing Harvest of Marine Mammals) using three criteria: (1) the potential change in requests for waiver of the MMPA take moratorium to allow harvest in the United States of marine mammals other than whales; (2) the potential change in requests for regulatory action to authorize harvest of whales in the United States, which would require application to the IWC for a catch limit, waiver of the MMPA take moratorium (with associated MMPA regulatory actions following NEPA review), and completion of a cooperative agreement under the Whaling Convention Act (WCA); and (3) the potential change in IWC regulation of commercial, scientific, or aboriginal subsistence whaling. The response below is organized around the comments we received rather than the three evaluation criteria in the FEIS.

(1) Additional requests for MMPA waivers for marine mammals other than whales

Regarding requests for MMPA waivers, the FEIS (Subsection 4.17.2.1, National Regulation of Marine Mammal Harvest) notes that authorization of a gray whale hunt by NMFS, and a gray whale hunt by the Makah Tribe:

> "…could lead other parties to seek similar authorizations to harvest marine mammals other than whales. Some Indian tribes traditionally harvested and used products from seals, sea otters, and other marine mammals. Northwest Indian tribes have, in the past, expressed an interest in harvesting marine mammals (Schmitten 1994). Authorization of a Makah gray whale hunt could revive the interest of the Makah or other tribes in hunting marine mammals. It could also lead to interest by non-Indians in sport or commercial hunting of marine mammals. Such interest could lead to additional requests for MMPA waivers from Indian tribes or non-Indians, and could, ultimately, lead to the federally authorized harvest of additional marine mammals if such harvest is consistent with the MMPA."

The FEIS (Subsection 4.17.3.2.1, National Regulation of Marine Mammal Harvests) concludes that under the action alternatives:

> "…there could be an increased likelihood of future [waiver] requests. We consider the increased likelihood to be small. First, as described in Subsection 3.17.3.1, Waivers of the MMPA Take Moratorium, there have been very few requests for waiver of the take moratorium, and none since 1987 except the Makah Tribe's request. This is likely the result of the complexity of the waiver

> process, the length of time required to complete the process, and the lack of resulting harvest opportunities. These factors would continue to limit interest in seeking MMPA waivers, even if a Makah whale hunt were authorized under one of the action alternatives. The most likely increase in waiver applications would come from other treaty tribes, who might view the approval of the Makah's application as a precedent for approval of additional waiver applications to take marine mammals that they had harvested traditionally and that remained important to them for cultural or other reasons. If authorization of a hunt under one of the action alternatives (Alternatives 2 through 7) did lead to additional waiver requests, the outcome of any process to consider them would depend on a number of facts specific to the requests that are not presently known, making it speculative to conclude that the harvest of marine mammals nationally would change as a result of implementing Alternatives 2 through 7. Any additional waiver requests for marine mammals would be subject to analyses under NEPA as well as the MMPA."

None of the commenters submitted new information that would change this conclusion or that supports the assertion that other tribes are strategically withholding waiver requests. We, therefore, conclude this assertion to be speculative.

(2) Additional requests for MMPA waivers for large whales

Regarding additional requests for whale hunts in the United States, the DEIS (Subsection 4.17.3.2.2, National Regulation of Whaling) states:

> "Although it has been over 35 years since Alaska Natives first received a WCA allocation and over 25 years since the Makah Tribe received its [original] allocation, no other Indian tribe or Alaska native group has requested an allocation or inquired about receiving an allocation for whales under the WCA. This history suggests that, beyond the Makah and the Alaska Eskimo Whaling Commission, there is little interest by other native groups to seek authorization to harvest whales. In addition, the complexity of the process and length of time required to complete it would probably limit the interest of most potential applicants. It therefore seems unlikely that implementation of Alternatives 2 through 7 would lead other Indian tribes to seek authorization to hunt whales.
>
> Nevertheless, tribes other than the Makah traditionally hunted gray whales (Subsection 3.4.3.6.1, Aboriginal Subsistence Whaling), and authorization of a Makah gray whale hunt could encourage them to seek a similar authorization. If authorization of a hunt under Alternatives 2 through 7 did

> lead to additional requests to hunt gray whales, the outcome of any process would depend on a number of facts specific to those requests that are not presently known, making it speculative to conclude that the harvest of gray whales nationally would change as a result of implementing Alternatives 2 through 7."

The recent Ninth Circuit decision does not change this conclusion as it is based on the complexity of international and domestic processes, not the underlying potential existence of a claim to aboriginal subsistence whaling. For example, if the Tribes in that case wished to assert a whaling right, they would need to satisfy domestic and international requirements regarding ASW claims, MMPA waiver, and WCA authorization. The commenters point to no additional information and we are not aware of any other new information that would change the conclusion in the FEIS. The suggestion that other tribes are strategically withholding requests is speculative.

(3) Future requests by the Makah Tribe to hunt other large whale species

The request currently being considered by NMFS is for a waiver of the take moratorium on ENP gray whales (see Subsection 2.3.2.2, Gray Whale Hunt Details). Regarding future requests by the Makah Tribe for waiver of the take moratorium for other large whale species, this would require evaluation and approval via separate processes under the IWC, NEPA, MMPA, and WCA. Before the Tribe could receive authorization to hunt any other species of large whale, the United States would have to request a quota on behalf of the Tribe and present a needs statement to the IWC, which would then have to approve a catch limit in light of that request. NMFS would then have to complete a NEPA evaluation of the request, engage in formal rulemaking under the MMPA, and enter into a cooperative agreement under the WCA. For these reasons, we conclude the analysis in the FEIS regarding requests by other tribes (see above) for ENP gray whale hunts is equally applicable to the likelihood of a request by the Makah Tribe for hunts of other large whale species besides gray whales.

During the hearing on the waiver, an administrative law judge (ALJ), also found that the concerns that granting a waiver to allow the Makah Tribe to hunt is a slippery slope and will result in others seeking to hunt in the future to be speculative and that no party identified any expression of such interest (Recommended Decision p. 125). This is supported by the analysis in the FEIS.

(4) Increased whaling worldwide

Regarding an increase in whaling worldwide, the FEIS examines in detail all whaling under the IWC—commercial, scientific, and aboriginal—before and after NMFS' authorization of Makah whaling in 1999

and 2000 and finds no change or pattern that would lead one to conclude another authorization more than a decade later would cause increased whaling world-wide. The FEIS notes that since 1997 "there have been no requests from additional countries for an aboriginal subsistence catch limit and no requests on behalf of additional aboriginal groups" (Subsection 4.17.3.2.3, International Regulation of Whaling).

The FEIS specifically examines claims, repeated by some commenters, that Japan could use domestic authorization of a Makah whale hunt under the MMPA to justify its request for small-type coastal whaling (see Subsection 4.17.3.2.3, International Regulation of Whaling [Commercial and Scientific Whaling]):

> "Though Japan attempted to use the bowhead catch limit by the United States request in 2002 in its pursuit of small-type coastal whaling, there is no evidence that this move led to a fundamental change in the U.S. position, in the positions of other countries, or in the international regulation of whaling. There is also no evidence that whaling proponents such as Japan could successfully use the U.S. authorization of a Makah hunt under domestic law as leverage to change the regulation of commercial or scientific whaling. It is more likely that the outcome of Japan's requests for small-type coastal whaling, or the pro-whaling nations' efforts to remove the moratorium on commercial whaling, depends on the balance of power in the IWC rather than on strategic maneuvers such as those that took place in 2002 over the bowhead catch limit.
>
> The support of Japan and the other pro-whaling countries for the ENP gray whale catch limit even as they were opposing the U.S. ASW bowhead catch limit in 2002 (3.17.3.2.2 Aboriginal Subsistence Whaling) also suggests that pro-whaling countries do not view the Makah hunt as leverage to change the regulation of commercial or scientific whaling. In 2007, bowhead and ENP gray whale aboriginal subsistence catch limits were set by consensus at the annual meeting of the IWC (Subsection 1.4.1.2.1, Relevant Overview of Requests for Bowhead Whales on Behalf of Alaska Eskimos; Subsection 1.4.1.2.2, Overview of Requests for ENP Gray Whales on Behalf of the Makah). The IWC has subsequently set these catch limits in a block vote with the humpback catch limit request of St. Vincent and the Grenadines (Subsection 1.4.1.2.2, Overview of Requests for ENP Gray Whales on Behalf of the Makah).
>
> Pro-whaling nations have argued that all whaling should be treated equally, limited only by principles of sound science and management. These nations could argue that the resumption of whaling by the Makah Tribe justifies an increase in other types of whaling. They might also argue that the ability of

> the Makah Tribe to sell handicrafts made from inedible parts (which would be authorized under Alternatives 2 through 7) makes the hunt "commercial," although this is allowed under the IWC's definitions for "subsistence use" and "aboriginal subsistence whaling." We consider it unlikely, however, that pro-whaling nations would be able to use this argument as leverage to change the regulation of commercial or scientific whaling. The United States and several other countries have a long history of opposing commercial and scientific whaling while supporting aboriginal subsistence whaling; thus, authorization of a Makah hunt would not introduce a new element into the long-standing debate over whether there is a difference between commercial and subsistence hunts. Moreover, Alaska Natives have been authorized under domestic law to make and sell handicrafts made from bowhead whales.
>
> Another piece of evidence suggests that aboriginal subsistence whaling generally, and authorization of a Makah hunt in particular, would not influence the debate over commercial and scientific whaling. The working group proposal presented at the 2010 IWC meeting included trade-offs between scientific and commercial whaling (Subsection 3.17.3.2.1, Commercial and Scientific Whaling). Aboriginal subsistence whaling appears not to have been a consideration in the proposed compromise between scientific and commercial whaling interests."

The FEIS also notes that the Canadian government and First Nations reached an agreement in 2006 in which the First Nations agreed to forgo whaling for 25 years in exchange for land, a share of mineral and timber resources, and a cash settlement (Subsection 1.4.1.1, Worldwide Catch Limits). It is possible that, at the conclusion of their 25-year agreement, First Nations (including those on the west coast of Vancouver Island affiliated with the Makah Tribe) would be encouraged by a Makah Tribe whale hunt to end their whaling hiatus. However, it is speculative at this time to consider what would happen in that regard in 2031.

Although some commenters made assertions about the intentions of other countries, particularly Japan, and past deal-making within the IWC, they did not bring forward any new evidence beyond what was considered in the DEIS and now the FEIS. We have also examined the IWC proceedings since the DEIS was released and found no new information that would change the conclusions in the FEIS.

5. Stock status of the Pacific Coast Feeding Group (PCFG) of ENP gray whales

Several commenters assert the PCFG should be designated and/or treated as a marine mammal population stock under the MMPA. Commenters present scientific, policy, and legal arguments supporting this

position. Some commenters also state that NMFS is biased and has avoided designating the PCFG as a stock to protect the ability of the Makah Tribe to whale. Several commenters urge NMFS to pursue the precautionary principle and treat the PCFG as a stock because of uncertainties surrounding its stock status. One commenter notes that if NMFS treated the PCFG as a stock and prepared a dedicated stock assessment report it would allow for a more informed decision.

Response

Section 117 of the MMPA directs NMFS to complete stock assessment reports (SARs), which, among other things, serve to identify the status of marine mammal "population stocks," the fundamental unit of legally mandated conservation under the MMPA. The MMPA provides general guidance on preparing SARs, and more detailed guidance is contained in agency "Guidelines for Assessing Marine Mammal Stocks" (GAMMS), which undergo public review and comment, including by the Marine Mammal Commission, and are periodically updated. The most recent GAMMS define a stock as an "MMPA management unit that identifies a demographically independent population, where demographic independence means the population dynamics of the affected group is more a consequence of births and deaths within the group (internal dynamics) rather than immigration or emigration (external dynamics)."

NMFS scientists develop SARs according to the GAMMS. Section 117 of the MMPA requires that the SARs be reviewed by regional scientific review groups (SRG) and made available for public review and comment. The Marine Mammal Commission routinely reviews and comments on the SARs during the public comment period (e.g., Carretta et al. 2023; 88 FR 54592, August 11, 2023). The SARs are officially published by the NMFS' Scientific Publications Office as part of the NOAA Technical Memorandum series. Prior to 2019, this statutory process was the appropriate mechanism for designating population stocks of marine mammals under the MMPA. In 2019, NMFS established procedural directive 02-204-03: *Reviewing and Designating Stocks and Issuing Stock Assessment Reports under the Marine Mammal Protection Act* (NMFS 2019), which separates the stock designation process from the SAR development. Prior to the annual SAR revision, NMFS identifies if "there are (1) any stocks that should be examined for possible revision or (2) potential new stocks that should be added" (NMFS 2019). The procedural directive outlines examples and criteria for when a stock revision may need to occur, as well as the steps involved in conducting such an assessment.

The 1995 (the first) SAR (Small and DeMaster, 1995) stated that "gray whales have been reported feeding in the summer in waters off Southeast Alaska, British Columbia, Oregon, and Washington." The 2005 SAR was the first to refer to such whales as a "Pacific coast feeding aggregation." The term

"feeding aggregation" is used by biologists to describe concentrations of whales that forage in a specific area but is not used to signify a stock as defined in the MMPA. In 2011, the International Whaling Commission (IWC) referred to this feeding aggregation as the "Pacific coast feeding group" (PCFG) and defined it as gray whales observed (i.e., photographed) in multiple years between 1 June and 30 November in the PCFG area (between 41°N and 52°N) (IWC 2011). The IWC does not have a stock identification process similar to the MMPA. NMFS has used the term 'PCFG' since the 2012 SAR (Carretta et al. 2013), which was the first to estimate various population metrics (e.g., minimum abundance estimates and levels of potential biological removal (PBR)) for such whales. In their comments on the 2012 SAR, the Alaska SRG recommended NMFS not recognize the PCFG as a separate stock and (consistent with views expressed by the Pacific SRG). They also recommended that NMFS not refer to the PCFG as a "prospective stock." In 2012, the Pacific SRG assumed responsibility for reviewing the gray whale SAR. In 2014, the Pacific SRG deliberated whether it is appropriate to calculate a PBR for the PCFG since it is not a separate stock under the MMPA. Ultimately, the SRG recommended that a separate PBR be calculated for the PCFG "for informational purposes only as the evidence was not persuasive enough at that time for the SRG to recommend that it be considered a separate stock." The ENP gray whale SAR was last updated in July 2021 (i.e., in the 2020 SAR), and the SRG reviews since then have not recommended a change in the status of the PCFG (Carretta et al. 2022; Carretta et al. 2023).

During the NEPA process, we asked agency scientists to further evaluate PCFG whales, which included convening a Task Force of agency scientists (Weller et al. 2013) specifically tasked with providing advice on the primary question: Is the PCFG a 'population stock' under the MMPA? The FEIS notes that this question has immediate management implications, including how future SARs will address gray whale stock structure in the North Pacific and how to respond to the Makah Tribe's waiver request. The Task Force reviewed all available information regarding the demographic independence of the PCFG. The Task Force framed their task as follows (from Weller et al. 2013):

> "That is, if the PCFG experiences little external recruitment then it would be considered demographically independent and should be recognized as a stock. If most of the recruitment into the PCFG were external, however, then it would not be considered demographically independent and would not be recognized as a stock. The [Task Force] concurred that the resolution of the existing photo-identification data in combination with uncertainly[sic] surrounding the accuracy of assigning whales as external or internal recruits prevent this question from being fully resolved. Increased genetic sampling in tandem with increased photo-id effort over both space and time may be the only way to better address this question."

The Task Force reviewed the available genetic information and noted that various studies found differences in mitochondrial DNA (mtDNA) between PCFG whales and whales from northern feeding areas, indicating some level of demographic independence. At the same time, they noted the lack of support for differences in nuclear DNA between PCFG whales and the rest of the ENP and concluded "it is most likely that PCFG animals are interbreeding with animals coming from other areas" (Weller et al. 2013). The Task Force "agreed that the critical issue for additional research to address was better determining the levels of internal versus external recruitment in the PCFG" (Weller et al. 2013) as that was the key to determining the demographic independence of the PCFG.[1]

After reviewing the best scientific information available from photo-identification, genetics, tagging, and other studies, the Task Force applied the GAMMS guidance to conclude that there is a substantial level of uncertainty in the strength of the lines of evidence supporting demographic independence of the PCFG. Consequently, the Task Force was unable to provide definitive advice as to whether the PCFG is a population stock under the MMPA and the GAMMS guidelines. The Task Force report was reviewed during the SAR process which, since 2012, has continued to result in NMFS finding that the PCFG is a feeding group that "may warrant consideration as a distinct stock in the future" (Carretta et al. 2023).

Subsequent to the Task Force findings and in response to our 2015 DEIS, the MMC acknowledged the uncertainty surrounding the status of PCFG whales and, consistent with recommendations by other commenters, supported the precautionary approach in the DEIS of including alternatives that separately manage and analyze impacts to the PCFG. Specifically, the MMC recommended that we adopt a hunt management scheme that would "keep [the PCFG] within its OSP [optimum sustainable population level] or some proxy for OSP." In addition, we evaluated the impacts of the alternatives at various scales, including impacts to the PCFG. While it is not known whether the PCFG is within a theoretical OSP (Punt and Moore 2012), the analysis in the FEIS considers how the alternatives might affect the OSP status of the PCFG.

Contrary to the assertions of some commenters, NMFS has not delayed analysis of ENP gray whale stock structure. Rather, as described in the FEIS, NMFS has devoted considerable resources to studying, monitoring, and evaluating the PCFG (see summary of research in Appendix 4 of NMFS 2018). NMFS has engaged in an ongoing review of ENP gray whale stock structure for more than 15 years and its

[1] Appendix 4 of the NMFS Biological Report on the Eastern North Pacific (ENP) Stock of Gray Whales (NMFS 2018) summarizes the NMFS research and monitoring activities addressing North Pacific gray whales.

determinations on stock structure have been routinely reviewed during the SAR process and published as NOAA Technical Memoranda (see FEIS Subsection 3.4.3.4.1, PCFG Population Structure). In 2012, NMFS undertook additional expert evaluation, establishing a NMFS Task Force comprising agency scientists from five different organizational units, most of whom have not been involved in reviewing the Tribe's request. These scientists used a structured decision-making process to allocate votes among plausible scenarios. The conclusion of the Task Force was reviewed during the SAR process by the Pacific SRG and made available for public review and comment; except for the Makah Tribe, none of the commenters on the DEIS or SDEIS have provided comments or information addressing ENP stock structure during the public process/review of the gray whale SARs. Nor do the commenters on the DEIS or SDEIS provide any new information for our review on this issue. Regarding a separate stock assessment for the PCFG, the information on PCFG whales contained in the ENP gray whale SAR is similar to what would be contained in a separate PCFG SAR. We therefore disagree that having a separate SAR for PCFG whales would improve our information base. We will continue to review and evaluate the stock structure of North Pacific gray whales through the process outlined in procedural directive 02-204-03.

6. Waiver of the take moratorium for WNP whales and/or PCFG whales

Several commenters on the DEIS suggest that tribal hunters would not be able to distinguish between ENP and Western North Pacific (WNP) whales, or between PCFG and non-PCFG whales, and therefore waiver determinations must be made for WNP and PCFG whales in addition to the ENP stock of whales. Many commenters cite the 1988 court decision in Kokechik Fishermen's Ass'n v. Sec'y of Commerce, 839 F.2d 795 (D.C. Cir. 1988) ("*Kokechik*"), to support this contention. Regarding WNP whales, commenters note they are listed as endangered under the Endangered Species Act (ESA), are therefore considered depleted under the MMPA, and are thus not eligible for waiver under the MMPA. Regarding PCFG whales, commenters argue that since NMFS has concluded the PCFG "may qualify for stock status in the future" NMFS should treat the group as a stock in making a determination on the Makah Tribe's waiver request. Some commenters also suggest that if the PCFG were designated as a stock in the future, additional decision-making would be required to waive the take moratorium for PCFG whales.

Response

The Makah Tribe has requested a waiver of the MMPA take moratorium, pursuant to the court's decision in *Anderson v. Evans*, for ENP gray whales only, and has requested approval of a gray whale hunt under the WCA for ENP gray whales only. The Tribe has not requested, and the alternatives do not contemplate, waiver of the take moratorium for WNP whales. Therefore, the moratorium remains in effect for

WNP whales. Since WNP whales are depleted and the moratorium has not been waived for these whales, the Agency may only authorize take of WNP whales through an authorization for incidental take, scientific research, photography, or enhancement

The FEIS describes a supporting analysis that shows the likely rate of a whaler encountering a WNP is substantially lower than that of an ENP gray whale based on 1) the low number of WNP relative to ENP gray whales, 2) the even lower number that are known to migrate to the ENP, and 3) their limited seasonal presence in the area of the hunt (Moore et al. 2023). Further, the FEIS provides information and analyses regarding the likelihood of the Makah Tribe killing, attempting to strike, and approaching a WNP whale under various action alternatives (see, for example, Subsection 4.4.3.2.2, Change in Abundance and Viability of the WNP Gray Whale Stock and Substantive Comment No.12) during an ENP gray whale hunt. This analysis was extremely conservative, assuming:

- WNP whales are homogenously mixed with ENP whales during migration and that a high proportion of WNP whales transit through the Makah U&A, even though few whales have actually been recorded there;
- The probability of a strike on a WNP gray whale vs. an ENP gray whale is the same throughout the Tribe's U&A;
- The annual limits on approaches, unsuccessful strikes, and strikes of 353 approaches would all occur during a winter/spring hunt season; and
- The maximum number of annual harpoon attempts would be achieved and would occur during the winter/spring hunt season.

Thus, the analysis likely overestimates the risk to WNP gray whales. This is particularly true for alternatives with a summer/fall hunt season, such as the Preferred Alternative, as some hunting and training would likely occur in those months. As required by NEPA, this analysis provides the factual basis for and illuminates the potential impacts of different alternatives on WNP gray whales. Relevant laws are described in FEIS Table 1-2, International, national, state, and tribal treaties, laws, regulations, policies, and processes that may be required for Makah whaling, but it is not the purpose of FEIS to resolve legal disputes related to the WNP or the applicability of the *Kokechik* case to the current waiver proceeding.

Regarding the argument that NMFS must separately waive the take moratorium for PCFG whales, as described in the FEIS and the response to Substantive Comment No.5, NMFS considers the PCFG to be a feeding aggregation within the ENP marine mammal stock and does not recognize the PCFG as a separate marine mammal stock as defined under the MMPA (Carretta et al. 2023). A waiver of the MMPA take

moratorium for ENP gray whales would, therefore, apply to PCFG whales, which are a component of the ENP stock. After weighing the best available scientific evidence, an ALJ found that the evidence supports NMFS' stock designation. That is, while the PCFG could be recognized as a stock in the future, currently available evidence suggests that the PCFG is a feeding aggregation in the ENP stock (see Recommended Decision Section IV.D.1). In consideration of the role of the PCFG in the local environment, the Tribe's request identified a management goal of avoiding local depletion of the PCFG. The action alternatives in the FEIS also incorporate a management goal of avoiding local depletion by including various protections for PCFG whales.

The FEIS contains sufficient information regarding the alternatives' potential impacts to ENP, WNP, and PCFG whales to inform future decision-making. If the PCFG were designated a population stock pursuant to Section 117 of the MMPA in the future, we would consider whether additional decision-making was needed at that time.

7. Calculation and use of 'potential biological removal' (PBR) for a PCFG mortality limit

Some commenters on the DEIS and SDEIS take exception to the method used in the SAR for calculating an informational PBR level for the PCFG or the way in which NMFS used the PBR formula to establish a mortality limit for PCFG whales in a hunt under the action alternatives in the DEIS. Objections include: the PBR formula should use the default reproductive rate for marine mammals instead of the rate for ENP gray whales; that there is no evidence that the net productivity rate doubled and this would be biologically impossible; the PBR formula should use a different recovery factor, similar to that used for endangered whale stocks; more of the hunt alternatives should have used a PBR based on a subset of the PCFG and not the entire PCFG; and a mortality limit set for the Tribe should account for the fact that the PCFG is a "transboundary stock" that experiences human-caused mortality outside U.S. waters. One commenter also faults the DEIS analysis as failing to analyze impacts at the local level because only one alternative would establish a PCFG mortality limit based on the PBR of whales in the OR-SVI survey areas. Another commenter notes that if abundance estimates become stale it compromises the value of PBR in managing mortality.

Response

NMFS calculates PBRs for marine mammal stocks through the SAR process in accordance with the requirements of the MMPA Section 117 and as outlined in the GAMMS. That process includes scientific review through the Scientific Review Groups, independent regional bodies which advise NMFS on a range of marine mammal science and management issues. There is also opportunity for comment by the

public and the Marine Mammal Commission, and the reports are published by the NMFS Scientific Publications Office, through which process they undergo additional review. That is, the PBR analysis that commenters have expressed concern about has gone through extensive scientific, peer, and public review. While PBRs are generally calculated at the stock level, the SAR calculates an informational PBR for the PCFG, a feeding aggregation of the ENP, to assess whether levels of human-caused mortality are likely to cause local depletion.

The SAR uses the reproductive rate of the ENP stock to calculate an informational PBR for both ENP and PCFG whales. This is appropriate in light of the fact that the PCFG is a subset of ENP gray whales, the product of interbreeding within the ENP stock, and there is no information to suggest that the reproductive rate would different. The SAR uses a reproductive rate for ENP gray whales from Punt and Wade (2012), which is the best available information regarding that rate. Where an actual estimate of reproductive rate exists, it would not make sense to use the NMFS default rate (which is 4 percent for cetaceans). Commenters provided no information to suggest that the ENP reproductive rate should be something other than the Punt and Wade (2012) estimate or that it would be more scientifically sound to use the NMFS default reproductive rate rather than the measured ENP reproductive rate for the PCFG.

The 2022 SAR uses a recovery factor for the PCFG of 0.5, giving the following explanation:

> "Use of the recovery factor of 0.5 for PCFG gray whales, rather than 1.0 used for ENP gray whales, is based on uncertainty regarding stock structure and guidelines for preparing marine mammal stock assessments which state that "Recovery factors of 1.0 for stocks of unknown status should be reserved for cases where there is assurance that Nmin, Rmax, and the kill are unbiased and where the stock structure is unequivocal" (NMFS 2005, Weller et al. 2013). Given uncertainties in external versus internal recruitment levels of PCFG whales, the equivocal nature of the stock structure, and the small estimated population size of the PCFG, NMFS will continue to use the default recovery factor of 0.5 for PCFG gray whales.

The recovery factor used in NMFS' SARs is based on the overall status of the population stock (or in the case of the PCFG, the feeding aggregation) in question. For example, blue whales and sperm whales are listed as endangered and therefore have an appropriately low recovery factor. The PCFG, in contrast, has remained relatively stable over the past nearly two decades, declining slightly in recent years from a peak in 2015 (Harris et al. 2022). There is no evidence that the PCFG warrants the same level of concern as an endangered species of whale. The SAR authors did err on the side of caution, with the agreement of the

Scientific Review Group and Marine Mammal Commission, in using a 0.5 recovery factor in the PBR equation. The ENP as a whole has a recovery factor of 1.0, which was another option considered for the PCFG during the SAR process. While considered, this recovery factor was rejected because the GAMMS states a recovery factor of 1.0 is only appropriate where stock structure is unequivocal (Carretta et al. 2023).

While the DEIS relied on the ENP gray whale SAR for the informational PBR for PCFG gray whales, the most recent ENP gray whale SAR had not been updated to include the most recent PCFG abundance estimates at the time this FEIS was in preparation. Therefore, the FEIS calculated the informational PCFG PBR based on the most recent PCFG abundance estimate (Harris et al. 2022) and the recovery factor and maximum net productivity rate used in the SAR. This is the best available scientific information on the status of the PCFG to inform the PBR estimate.

Regarding the comment about the maximum net productivity rate used in the SAR, the commenter stated that the productivity rate "increased from 3.2 percent to 6.25 percent," noted that there was no evidence to support a doubling of the rate, and stated that such a doubling would be biologically impossible. A population's net productivity rate (R) is the ratio of births to deaths. A population that is growing will have more births than deaths. For example, a population that has 104 births and 100 deaths has an R of .04, or 4 percent. At some level of abundance below carrying capacity (K), a population will have the maximum possible rate of net productivity (Rmax). This level of abundance is known as the 'maximum net productivity level' or MNPL. In the absence of data to establish an Rmax for use in the PBR calculations, NMFS generally uses a default value of 4 percent for large whales. As a population grows from MNPL toward K, the rate of reproduction will decrease toward zero. A population at K will have an equal number of births and deaths, or an R of zero.

There are two problems with this commenter's statement that Rmax in the gray whale SARs has "grown" from 3.2 to 6.25%, which is "biologically impossible." First, the SAR has never set Rmax at 3.2 percent. Rather, the first gray whale SAR in 1995 stated that abundance estimates for the period 1967-1968 to 1993-1994 indicated an Rmax of 3.3 percent but this conclusion was regarded as questionable by the IWC Scientific Committee. That SAR recommended using the default Rmax (4 percent) until scientific consensus could be reached. Through the 2010 SARs, values of 4 percent to 4.7 percent were used, based on the best available information at the time the SARs were developed. In the 2012 SAR, NMFS raised its estimate of Rmax to 6.2 percent, based on new abundance data and new analyses of population parameters. Again, this does not signal that NMFS believes the ENP population's maximum potential rate

of increase "grew" from 4 percent to 6.2 percent. Rather, it represents a new understanding and revision of the productivity rate, based on the new and best available information.

The second problem is that the commenter appears to confuse the concept of "the estimated annual rate of increase," which is an average over a period of time, with Rmax, which is a measure of the rate of increase at a single point in time. The 2013 SAR reports that Punt and Wade (2012), based on the entire abundance series from 1967/1968 through 2006/2007, estimated that the annual "rate of increase" (i.e., the average annual net gain in abundance) was 3.2 percent. That is, from 1967/1968 through 2006/2007, the population grew 3.2 percent on average each year. As would be expected, the stock's rate of increase would be higher when the abundance was low. As the population approaches K, the rate of increase would be very low. Combining the early high rate of increase (estimated to be 6.2 percent) and the low rate of increase as the population approaches K (approaching zero) yields an average rate of increase of 3.2 percent.

With respect to the comment that hunt alternatives should have used informational PBRs based on a subset of the PCFG and not the entire PCFG, we disagree. Various approaches, including PBR-based approaches, were used under the alternatives to calculate an allowable mortality limit for PCFG whales (see Subsection 2.3, Alternatives Considered for Detailed Study). Alternatives 2 through 6 include a PBR-based approach. Alternative 2 represents the Tribe's 2005 proposal, which includes a PBR-based harvest limit on PCFG whales that is calculated using the abundance of whales in the survey areas from Oregon to southern Vancouver Island (OR-SVI). The Tribe's proposal was submitted several years before the IWC considered the PCFG as a separate management stock (which is may not be equivalent to a stock as defined under the MMPA) and was based on the recommendation of Calambokidis et al. (2004) that the OR-SVI area was the appropriate region for estimating an abundance level to be used in an abundance-based harvest regime. In 2012, through the SAR process, NMFS described the PCFG as a feeding aggregation and adopted a definition of the PCFG based on a considerable body of new information. The SAR adopted the definition agreed by the IWC, which is whales that are observed in more than one year in the area from Northern California to Northern British Columbia during the months of June through November. The SAR and Harris et al. (2022) also calculate an informational PBR for the PCFG based on its estimated abundance in the entire summer range, not just the OR-SVI region within that range. We consider the approach used in the SAR and Harris et al. (2022) to represent the best scientific information available regarding delineation of this feeding aggregation. The FEIS designed the management regimes for the other action alternatives, 3 through 7, around that unit of interest rather than the smaller group of whales frequently seen in the OR-SVI. Regardless of how the various alternatives use PBR to calculate an

allowable mortality limit for PCFG whales, the FEIS analyzes impacts to PCFG whales at all scales mentioned by commenters—the entire PCFG, the OR-SVI survey areas, and the Makah U&A. This provides information on impacts at several scales that will aid future decision-making by NMFS.

Contrary to the assertions of commenters, this approach meets NEPA's requirement to analyze impacts at a local scale. The Ninth Circuit Court of Appeals in *Anderson v. Evans* (2004), required NMFS' NEPA analysis to consider the impact of the alternatives on the "local" area, which the court stated was the Makah Tribe's U&A. *Anderson*, 371 F.3d at 489–93. The FEIS analyzes impacts to that area, as directed by the court, at the larger OR-SVI area (for example, Subsection 4.4.3.2.4, Change in Numbers of Gray Whales in the Makah U&A and OR-SVI Survey Areas), the PCFG, and the ENP. That is, the analysis considers impacts on the local population through to the stock level. The court's ruling did not require that management measures in the alternatives focus on any particular area, only that impacts be analyzed at the local scale. In constructing action alternatives other than the Tribe's proposal, we selected the area identified by the IWC and the NMFS SAR process as the relevant area for considering management of PCFG whales.

We agree that any hunting regime should take into account that the PCFG spends time outside of U.S. waters and experiences human-caused mortality beyond the mortality occurring in U.S. waters. We also agree that the human-caused mortality reported in the SARs does not represent the total of human-caused mortality experienced by the PCFG. For example, lethal ship strikes or entanglements may go unobserved and undocumented. However, there is no information on the extent to which cryptic (i.e., unobserved mortality) of PCFG whales occurs. The analysis in the FEIS is based on the best available information. We also agree that stale abundance estimates have the potential to compromise the use of PBR in setting mortality limits. Thus, we have included measures under some alternatives to address this concern. Alternative 7 (Composite Alternative – Preferred) implements multiple protective measures for the PCFG, including 1) a strike limit of 16 whales over 10 years (no more than 8 of which may be female), 2) a low-abundance threshold of 192 whales (N) or 171 (Nmin) based on the most recent or forecasted abundance estimates below which hunting must cease, and 3) a permitting scheme that allows NMFS to further restrict the number of PCFG whales that may be struck in any given season. For more information on these measures, refer to the response to substantive comment No.20 on the use of a PCFG "dimmer switch."

8. The Treaty of Neah Bay

Several commenters on the DEIS and SDEIS assert that the United States abrogated the Treaty of Neah Bay between the United States and the Makah Tribe when the United States entered into the ICRW or enacted the MMPA or both. They argue that the United States therefore no longer has "the legal right" to authorize whaling by the Makah Tribe or anyone else.

Several commenters also assert that the Makah Tribe's treaty does not give the Tribe the right to whale. Some commenters suggest the Tribe's right to whale ended when adoption of the WCA prohibited other U.S. citizens from whaling. In other words, it is not possible for tribal members to whale "in common with" other citizens. Other commenters invoke other reasons for why the treaty provisions regarding whaling are no longer valid or argue only that whaling is outdated, without analysis.

Response

The Tribe submitted its request for a waiver of the MMPA consistent with the Ninth Circuit's holding in *Anderson v. Evans*. The purpose of the NEPA process is not to litigate the role or scope of the Makah's treaty right in pursuing an ENP gray whale hunt. Rather the purpose of the FEIS is to analyze potential impacts of alternatives to inform decision-making under the MMPA and the WCA. The relevance and/or weight attributed to the Makah's Treaty will be addressed as appropriate during decision-making pursuant to the relevant processes and criteria defined in the MMPA and WCA.

9. Non-lethal action alternatives

Several commenters on the DEIS considered the NEPA process deficient, arguing that the DEIS did not fully analyze non-lethal alternatives, including compensation by the federal government, federal support of alternative activities such as a whale watching operation or a ceremonial type hunt. One commenter suggested that NMFS could remove the speculation about alternative compensation to the Tribe by negotiating the deal first, then conducting the NEPA analysis. Some commenters urged adoption of non-lethal hunt alternatives to avoid any risks to WNP gray whales.

Response

The FEIS did consider non-lethal alternatives, including a ceremonial type-hunt and one that would provide other means of compensation to the Tribe, such as to establish a whale-watching business. A non-lethal, ceremonial type hunt alternative was eliminated from detailed analysis (Subsection 2.4.1, Non-lethal Hunt) because it would not meet the purpose and need for the proposed action and would not result in different impacts than the No-action Alternative.

A compensation alternative was considered in the FEIS but eliminated from detailed analysis for several reasons (Subsection 2.4.7, Alternative Compensation to the Makah Tribe), including that it was too speculative to consider and it would not meet the U.S. Government's federal trust responsibilities to the Makah Tribe with respect to the Tribe's reserved whaling rights or the Tribe's purpose to resume its traditional gray whale hunt under its treaty right, and impacts would be similar to the No Action alternative (thus, not providing additional information).

As noted in the FEIS and described by some commenters, the Makah Tribe declined a 1990s offer by a private party for money in exchange for a voluntary moratorium on hunting. Commenters offer no evidence to suggest the Tribe would be interested in an offer at this time, and the Tribe's request for a waiver of the MMPA take moratorium is evidence that the Tribe's desired course of action is a hunt rather than compensation. The suggestion that NMFS could remove the speculation by negotiating a deal first is outside the scope of the NEPA analysis. When an applicant to a federal agency proposes an action, NEPA does not require the agency to negotiate a different course of action with the applicant before analyzing the impacts of the applicant's proposal, along with a reasonable range of alternatives.

The non-lethal alternatives, similar to the No-action Alternative, would preclude a hunt, and our analysis of their potential effects on the human environment revealed that the impacts would not be different from the No-action Alternative. Detailed analysis of these alternatives would provide no additional information to inform a reasoned choice for the public or decision-maker. Nor do the commenters identify information on any additional or different impacts that these additional alternatives might reveal, beyond the potential economic impact to the Tribe. Because the Tribe expressed no willingness to entertain such a negotiation, providing speculative information regarding potential economic benefit that the Tribe has not requested and has previously rejected would not further inform the decision-making process.

10. Response of gray whales to being hunted

Some commenters raise concerns that PCFG and non-PCFG whales would alter their distribution and avoid the hunt area as a result of disturbance from hunt-related activity. They disagree with the analysis in the DEIS that analogizes Makah hunt-related activity with hunting by Chukotkan Natives, whale watching operations that involve pursuit and close approaches, and research-related activity that involves pursuit, close approaches, and biopsies. One commenter suggests that PCFG whales not exposed to hunting by Chukotkan Natives would experience hunting as a "novel threat" and recommended we compare whale reactions to other novel threats. One commenter asserts there is a high probability of

WNP gray whales being approached, then asserts the DEIS is inadequate because the analysis of the impacts of unsuccessful harpoon attempts on WNP gray whales is deficient.

Response

The FEIS considers the potential for PCFG whales to change their distribution in the PCFG feeding area, including abandoning the Makah U&A, in response to a hunt (see Subsection 4.4.2.4, Change in Numbers of Gray Whales Using the Makah U&A and OR-SVI Areas). To assess potential impacts of a Makah tribal hunt on gray whale behavior, the FEIS examines available information on how gray whales and other baleen whales respond to pursuit by vessels, including approaches by whale watching vessels, approaches and biopsy sampling by researchers, and hunts by Chukotkan Natives. We also consider gray whale responses to other types of human activities such as activities that produce sound. We found evidence that these activities could cause immediate reactions such as diving, swimming away, altering breathing patterns, etc. In one case human-generated sounds appear to have caused gray whales to abandon a breeding lagoon during the season in which the sounds occurred. Some of these sources of human activity may have been familiar to whales while others may have been novel.

Commenters took exception to the comparisons with other activities, noting the differences in the activities or the incompleteness of the information and, therefore, took exception to the conclusion drawn in the DEIS that it is unlikely a Makah tribal hunt would cause gray whales to abandon the Makah U&A or otherwise significantly alter their distribution. However, they offered no additional information beyond what was considered in the DEIS that would better inform the analysis. Lacking direct information about how gray whales in the Makah U&A might react over time to a Makah tribal hunt, we used the best available information about how gray whales react to similar activities to assess the impact of the hunt components—that is, approaching whales in motorized and non-motorized vessels, throwing harpoons at whales, and making noise—and examined available information about how gray whales react to similar activities.

Subsection 3.4.3.6.6, Vessel Interactions, of the FEIS describes studies of whale watching operations that show proximate changes in behavior of individual whales but do not show long-term changes in distribution of whales in response to whale watching operations. That subsection also describes changes in gray whale tagging that show no long-term behavioral changes and studies of other baleen whales subjected to biopsies, showing dramatic short-term responses but no long-term behavioral changes. Therefore, our FEIS analysis reflects the fact that none of these studies show a permanent shift in gray whale distribution.

We disagree with the assertion that a comparison with the Chukotkan hunt is not informative and that different gray whales use the PCFG feeding areas than use the Chukotkan feeding areas. The FEIS notes that the PCFG includes a large number of animals that do not return to the PCFG seasonal range each year, so it is reasonable to expect that some of the whales sighted in the PCFG seasonal range may have been exposed to Chukotkan hunts. It is also reasonable to conclude that whales frequenting the PCFG feeding areas would become habituated to hunting, as whales frequenting Chukotkan feeding areas appear to have. There is no information to support a conclusion that whales feeding in the PCFG range would have vastly different reactions compared to whales feeding off Chukotka.

Regarding the suggestion that we seek out information on how gray whales might react to novel threats, Subsection 3.4.3.6.5, Offshore Activities and Underwater Noise, of the FEIS does describe gray whale responses to noise suddenly introduced in breeding lagoons. That subsection describes a number of studies involving gray whale reactions to noise and other anthropogenic disturbance. Such reactions include diving, changing course, changing calls, stress response, etc. In one study whales largely abandoned a breeding lagoon following a month of noise transmission, although they returned to the lagoon the following year (Jones et al. 1994).

The FEIS notes that although the gray whale population is exposed to whale-watching vessels and other disturbances on the wintering grounds and along much of the migration route, it has demonstrated a tolerance and resiliency to whale watching and other noisy human activities as reflected by the successful recovery of the population from over-exploitation. Thus, available evidence suggests that gray whales will return to the area of disturbance and resume normal activities and behaviors.

While the FEIS was informed by the best available information, we acknowledge that there is limited information specific to gray whale responses to the approaches, attempted strikes, and strikes associated with a canoe-based hunt. In evaluating MMPA research permit applications, the agency typically uses a 100-yard threshold as a criterion to identify approaches that might disrupt whale behavior. Such close approaches do not always disrupt whale behavior. Our reference to possible similarities between whales reacting to hunting approaches and tagging is based on discussions with researchers involved in tagging efforts.

Regarding the comment that there is a high probability of an approach and a strong likelihood of an attempted strike on a WNP gray whale, and that these actions could have severe impacts on WNP gray whales, the FEIS notes that under the Tribe's proposal (Alternative 2),

> "Modeling based on Moore et al. (2023) estimates that between 2.8 and 4.2 WNP gray whales may be approached per year under Alternative 2. This assumes that all 353 training and hunting approaches are utilized annually, that each approach is made on a unique individual, and that all approaches are made during the winter and spring months when WNP gray whales may be present in the hunt area. Assuming that all harpoon attempts are made each year, between 0.056 and 0.084 WNP gray whales may be subjected to unsuccessful harpoon attempts annually. It is unlikely that all of these assumptions will be met, therefore this is a precautionary estimate of the potential impacts to WNP gray whales under Alternative 2."

Under the Preferred Alternative (Alternative 7), the number of WNP gray whales that may be subjected to unsuccessful harpoon attempts is even lower: between 0.024 and 0.035 whales annually. The comment overstates both the probabilities and the potential for this level of interaction to have an impact on WNP gray whales, given the low probabilities for interaction discussed above in a worst-case scenario that is unlikely to happen (Subsection 4.1.2.4, Potential Number of Unsuccessful Harpoon Attempts and Approaches), as well as any short-term behavioral response expected (Subsections 3.4.3.6.5, Offshore Activities and Underwater Noise, and 3.4.3.6.6, Vessel Interactions).

We also disagree with the commenter's assertion that the DEIS analysis is deficient and that we are required to conduct additional studies in the face of incomplete or uncertain information. The commenter points to no studies that could be done short of mounting an actual hunt in the Makah U&A. We have analyzed whale reactions to analogous activities, including aboriginal subsistence hunting by Chukotkan Natives and are unaware of studies that could be done to better inform this portion of the analysis. Alternatives 6 and 7 in the FEIS include a 10-year term for regulations authorizing a hunt, which would create an opportunity to assess the effect a hunt is having on gray whale distribution in the Makah U&A and more generally in the PCFG area. All of the action alternatives contemplate ongoing monitoring.

11. Safety of gray whale products for human consumption.

Several commenters on the DEIS raise concerns about contaminant levels in gray whales that would be consumed by Makah tribal members. Some commenters urge NMFS to prohibit a hunt based on human health concerns. Some commenters assert that the DEIS analysis is inadequate because we did not

conduct additional studies to compare contaminant levels in foods that would be replaced if Makah tribal members consumed gray whale products in place of foods they currently consume. One commenter asserts that no gray whale products would pass Washington State standards for safe consumption. Another commenter notes that the DEIS does not identify state and federal food safety standards relevant to edible gray whale products and does not compare contaminants found in gray whales with those standards except for PCBs.

Response

The FEIS presents the available information regarding nutrients found in gray whale products (Subsection 3.16.3.1, Nutritional and Health Benefits from Consuming Whale Food Products and Other Traditional Subsistence Foods). It also describes contaminants found in gray whales sampled to date (Subsection 3.16.3.2, Environmental Contaminants in Gray Whales) and risks of exposure to food-borne pathogens from consuming subsistence foods (Subsection 3.16.3.3, Exposure to Food-Borne Pathogens).

Regarding contaminants in the sampled gray whale products, including the one whale harvested by the Makah Tribe in 1999, the FEIS (Subsection 3.16.3.2, Environmental Contaminants in Gray Whales) reports:

> [C]oncentrations for some of these contaminants in whale blubber can be quite high, resulting in quite low "allowable consumption rates." For example, the unweighted average PCB concentration for the 13 sets of gray whale blubber samples in Table 3-47 is 386 µg/kg. While the Washington State Department of Health has not developed screening levels for gray whale blubber, this value - combined with the estimated per capita blubber consumption rates in the Tribe's needs statement (approximately 20-25 grams/day; Renker 2018) and other values applied by the Washington Department of Health (e.g., an 8-oz [227-gram] meal size) - yields a calculated "allowable consumption rate" of 0.49 meals of blubber per month. This level would likely result in a 'no consumption' recommendation by the Washington State Department of Health (rounded to 0 meals per month). One of the lower PCB concentrations observed in gray whale blubber (87 µg/kg) would yield an allowable consumption rate of 2 meals of blubber per month and a recommended maximum of two 8-oz (227 gram) meals per month (E. Christie, Washington State Department of Health, pers. comm., March 22, 2023)."

In other words, whether it would be considered safe under the Washington State Department of Health PCB guidelines to consume gray whale blubber would depend on the PCB concentrations in a particular

whale. The FEIS notes that contaminants are not a concern for whale meat, as opposed to blubber (Table 3-47). It is therefore an overstatement to claim that no consumable part of a harvested gray whale would pass Washington State standards for safe consumption, although, it is correct to raise concerns about consumption of more than 6 pounds of gray whale blubber per year under the most favorable assumptions.

In terms of the net effect of consuming whale products on tribal members, the FEIS (Subsection 4.16.2.2 Environmental Contaminants) notes:

> Whether consuming freshly harvested gray whale food products would affect contaminant exposure in Makah tribal members would depend largely on the types and levels of contaminants present in an individual tribal member's existing diet relative to several factors: (1) what part(s) of the whale and how much of each would be consumed, (2) what currently consumed food items (and associated contaminants) would be replaced by gray whale food products, (3) the age and sex of the whale, (4) possibly the time of year and body condition of the whale, and (5) how each food item would be collected, stored, and prepared for consumption. None of this information is currently available or could reasonably be obtained.

The FEIS makes the same conclusion regarding net nutritional benefit to Makah tribal members of consuming gray whale products.

Federal and state regulations regarding contaminants in food do not apply to subsistence foods harvested by Native American Tribes. Nevertheless, we agree it is useful to include references to relevant food safety standards in our environmental analysis. The U.S. Food and Drug Administration (FDA) publishes The FDA Compliance Policy Guide[2], which has action levels for pesticides, some of which are found in gray whales, as reported in FEIS Table 3-47. None of the pesticides found in gray whale muscle samples exceed the FDA action levels. For blubber, one whale sampled slightly exceeded the FDA guidance for Chlordane. FDA regulations at 21 CFR 109.30 specify an action standard for PCBs of 2 ppm, which was not exceeded in any of the gray whale blubber samples reported in Table 3-47. However, the Environmental Protection Agency (EPA) recommends safe consumption amounts of seafood based on PCB levels, as reported in the FEIS and discussed above. The FDA does not regulate most metals in food.

[2] Available at https://www.fda.gov/inspections-compliance-enforcement-and-criminal-investigations/compliance-manuals/manual-compliance-policy-guides (last visited October 24, 2023).

The FDA and EPA provide joint guidance[3] for pregnant women on mercury consumption but this would appear not to be a concern for gray whales, which have low levels of mercury in their muscle and no detectable mercury in their blubber (Table 3-48). The State of Washington guidance follows EPA and FDA guidance[4].

While the information regarding the effect of contaminants on human health is limited, the information is adequate to describe in general terms the potential positive and negative health effects of consuming gray whale products and to compare the alternatives in the FEIS based on the amount of gray whale products that would be available for consumption under each of the action alternatives.

Executive Order #12898 on Environmental Justice, with regard to subsistence consumption of fish and wildlife, requires federal agencies "whenever practicable and appropriate" to "collect, maintain, and analyze information on the consumption patterns of populations who principally rely on fish and/or wildlife for subsistence." Federal agencies are to communicate risks associated with those consumption patterns to the public. We have met this requirement by collecting the available data and including it in the FEIS. This information is available to the Makah Tribe for consideration when assessing the potential risks of consuming gray whale blubber. EO 12898 also requires federal agencies "whenever practicable and appropriate" to work together "to publish guidance reflecting the latest scientific information available concerning methods for evaluating the human health risks associated with the consumption of pollutant-bearing fish or wildlife." Although NMFS does not have expertise regarding safe consumption levels of contaminants, the agency does coordinate with the U.S. Food and Drug Administration and the EPA through the seafood safety program. EPA has issued guidance on safe consumption levels for various contaminants, which is available to state, tribal, and local authorities. During development of the FEIS we consulted with the Washington State Department of Health regarding concentrations of certain contaminants found in gray whale tissue samples, in particular PCB levels in blubber. While there are no known contaminant screening levels for gray whale blubber, we did provide guidance in the FEIS regarding likely 'allowable consumption rates' based on observed levels of PCBs (3.16.3.2 Environmental Contaminants in Gray Whales). If the Tribe is allowed to resume hunting gray whales, it may be possible to conduct real-time studies to more rigorously evaluate contaminants and human health risks.

A memorandum from the President accompanying E.O. NO. 12898 clarifies that federal agencies are to analyze effects on human health under NEPA, "including effects on minority communities and low-income communities." It also requires that federal agencies provide for minority and low-income communities to have input into the environmental review process. The FEIS has met these requirements as well.

12. Risks to WNP gray whales

Several commenters on the DEIS and SDEIS object to the risk posed to WNP gray whales from a tribal hunt, asserting that too little is known about the stock and any risk is too high for this endangered stock. Several commenters note that tribal hunters would be unable to distinguish WNP whales from ENP whales, and some commenters stated that hunters would not be able to identify and therefore avoid killing a pregnant female WNP whale.

Response

The FEIS presents the likelihood of striking a WNP whale for each of the action alternatives, which ranges from a zero percent chance under Alternative 4 (Summer Hunt) to a 5.6-8.4 percent chance per year under Alternative 2 (Tribe's Proposed Action) (Table 4-1). We considered a number of alternatives that would have reduced risk to WNP gray whales. Alternative 4, included in response to public comments, considers authorizing a hunt at a time when WNP whales would not be present. Alternative 5 (Split Season Hunt) and Alternative 7 (Composite alternative - Preferred) were also developed to reduce the likelihood killing a WNP whale. The hunting seasons under Alternative 5 were designed to occur when WNP whales would be expected to be traveling to or from the feeding grounds off Sakhalin Island. The FEIS analysis revealed that there is insufficient information to support an assumption that WNP whales would not be present during the hunting seasons proposed in Alternative 5 or during the winter hunt proposed in Alternative 7. These alternatives reduce the risk to WNPs when compared to some of the other action alternatives.

The FEIS notes that the death of a single WNP whale would be a conservation concern because of the small population size, and several commenters echoed this concern. In response to concerns raised in these comments, we present the following additional discussion based on information from the WNP gray whale SAR, which is cited in the FEIS. The PBR for WNP whales in U.S. waters is 0.12 whales per year, which translates to about 1 whale mortality due to human causes every 8.3 years (Carretta et al. 2023). PBR is the maximum number of whales, not including natural mortalities, that may be removed from a stock while allowing that stock to reach or maintain its optimum sustainable population. The 2.4-3.5

percent chance of killing a WNP whale each year under the Preferred Alternative (Alternative 7) would translate into about 0.024-0.035 WNP whales being killed annually (see Table 4-1 in the FEIS) or 1 WNP whale being killed every 29-49 years. In other words, under Alternative 7, the likely mortality level would be about one-third to one-fifth of the PBR. This information is consistent with the conclusions in the FEIS about likely effects of the action alternatives.

We agree that tribal hunters would not be able to distinguish between ENP and WNP whales (except known whales with highly visible and unique markings), and that it may be difficult to identify pregnant females during certain times of the year. Given the similarity in appearance, the action alternatives include measures to mitigate the likelihood of taking a WNP whale, and the analysis is sufficiently robust to compare the alternatives with respect to impacts to WNPs. The FEIS acknowledges that for the WNP whales, the No-action Alternative would result in no change in health, abundance, or habitat conditions (Subsection 4.4.3.1, Alternative 1, No Action (because zero whales would be killed by hunting). As potential mitigating measures for alternatives that would authorize hunting at a time when WNP whales may be present, the FEIS suggests photo-identification procedures to determine whether a struck whale was a WNP whale and cessation of a hunt if a WNP whale is struck. In response to these comments, we identified additional potential mitigation measures that were incorporated into Alternative 7, which could include: (1) requiring a waiting period after a whale is struck, to allow for identification of a struck whale before additional whales are struck and to avoid the possibility of striking multiple WNP whales that may be traveling together and (2) allowing only one hunting party on the water at a time to avoid the possibility of a second whale being struck before there is an opportunity to identify a whale that is struck.

The FEIS also presents the risk that WNP gray whales would be subjected to attempted strikes and approaches by vessels (Table 4-1 in the FEIS). As discussed in the response to substantive comment No. 10 regarding the response of gray whales to being hunted, available information suggests these activities would result in minor short-term reactions that would not harm the viability of individual whales or cause WNP whales to abandon the hunt area. Since 2010 (i.e., when WNP gray whales were first satellite-tracked to the ENP), NMFS has completed over 160 ESA consultations to determine whether such whales might be affected by various proposed activities. Typically, these consultations have concluded that effects would be insignificant due to the nature of the activities and/or discountable because the potential exposure of WNP gray whales to actions that occur along the U.S. west coast is very limited given the small population size of the WNP stock and the rarity of sightings off the U.S. west coast. The limited risks or extent of adverse impacts that could be anticipated was considered in context of risk for the entire population of WNP gray whales that may migrate through the U.S. west coast each year. In the limited

number of formal consultations for WNP gray whales that have occurred (four in total as of 2023), the actions that were determined likely to adversely affect WNP gray whales were related to environmental contaminants. On November 8, 2023 NMFS completed consultation on the impacts of the ALJ's recommended decision (Alternative 7) to WNP gray whales. In a letter of concurrence, the West Coast Region concluded that the proposed action was not likely to adversely affect WNP gray whales due to the extremely low probability that training and hunting activities would overlap in space and time with the limited number of WNP gray whales that may be transiting through the MUA on their south and north migrations (see NMFS 2023 for more information).

None of the comments regarding risks to WNP whales present evidence that was not considered in the DEIS or that contradicts or augments the analysis in the FEIS.

13. Risks to PCFG whales

Several commenters on the DEIS and SDEIS express concern about risks to PCFG whales in general as a result of a Makah hunt, and to those PCFG whales that frequent the Makah U&A in particular (referred to in some comments on the DEIS as the 33 "resident whales"). Commenters also express concern about ecosystem effects in the Makah U&A if whales are killed that frequently spend summers feeding in that area. One commenter notes that allowing more than one hunting party to hunt at a time could lead to hunters exceeding the limits on PCFG whales. Some commenters assert that under Alternative 1, even though the same number of ENP whales might be killed, at least there will be no risk to PCFG whales.

Response

The alternatives considered in the FEIS consider the status of the PCFG whales and the risks to this population. In their request, the Makah Tribe proposed protections for PCFG whales, as reflected in Alternative 2, and all of the action alternatives contain some level of protection for PCFG whales. To conserve PCFG whales, and in response to these comments, the proposed waiver and regulations analyzed under Alternative 7 (the Preferred Alternative) contain a number of protections for PCFG whales that are more restrictive than Alternative 2. The term of the waiver is 10 years, which ensures a timely reassessment of all factors related to a hunt, in particular potential impacts on PCFG whales and whales that frequent the Makah U&A. The proposed regulations limit the number of PCFG whales that may be killed over 10 years to 16 and set a PCFG abundance threshold below which no hunting would be allowed. For hunts during the feeding period, when only about half of the whales present are PCFG whales, any whale killed will be counted towards the overall PCFG limit. Also for hunts during the

feeding period, whale hunts must stop once a single whale is harvested, even though the strike limit during that hunting period allows for two strikes. There are also limits on the numbers of PCFG whales that may be approached and that may be subjected to attempted harpoon throws. Although there is no direct evidence that a Makah whale hunt would cause PCFG whales to abandon the Makah Tribe's U&A, these limits are intended to minimize that possibility and other impacts to PCFG whales.

Regarding concerns about removals from the group commenters refer to as the 33 "resident whales," this comment is misleading. As reported in Calambokidis et al. (2014) and reflected in DEIS Table 3-7, there were an estimated 81 Makah U&A (MUA) whales, with an average of 33 MUA whales in any single year. Harris et al. (2022) recently updated those numbers to 119 MUA whales, with an average of 39 sighted in any single year (see FEIS Table 3-7). The regulations under Alternative 7 would restrict the potential mortality of PCFG whales to no more than 16 over a 10-year period and the actual number may be smaller because of the protections in place, as described above. Thus, the number of PCFG whales killed (a maximum of 16) would be out of 119 (if all PCFG whales killed were also sighted in the MUA between June 1 and November 30), not 33. In addition, as reported in the DEIS, PCFG whales range widely throughout the feeding season and are likely attracted to areas based on availability of prey, thus if a tribal hunt removed MUA whales, there is a likelihood that new whales would recruit to the area to take advantage of prey resources (Subsection 4.4.2.4, Change in Numbers of Gray Whales in the Makah U&A and OR-SVI Areas).

We disagree that the removal of PCFG whales from the Makah U&A will have an effect on the local ecosystem. As noted in the FEIS, the area where the hunt would occur is highly energetic and shaped by large-scale environmental forces and the effects of hunting would not be appreciable either as a result of hunt activities or the removal of PCFG whales (e.g., Subsections 4.3.3.2.1, Pelagic Environment and 4.3.3.2.2, Benthic Environment). Commenters present no new information that is contrary to that contained in the FEIS and supporting its conclusions.

The 33 "resident whales" referred to in these comments are presumably members of the larger group of PCFG whales. FEIS Subsection 4.4.2.4, Change in Numbers of Gray Whales in the Makah U&A and OR-SVI Areas, notes that "it is possible that a killed PCFG whale that would otherwise have spent all or part of the summer in the Makah U&A or OR-SVI areas (whether returning or not) could be replaced during the same year by a whale from outside those areas, as many whales feeding during the summer throughout the PCFG range move great distances among survey areas, likely attracted by the presence of prey. During the course of the summer feeding period, it is therefore possible that whales not previously

seen in the Makah U&A or the OR-SVI survey areas (e.g., from West Vancouver Island or northern California) would travel through these areas and stay to feed on available prey. Whether replacement would occur in the same year would depend on the number of whales removed, the availability of prey within the local survey areas relative to its availability in outside areas, and the opportunity for whales from outside the area to discover an unexploited source of prey." The FEIS acknowledges that for the PCFG, the No-action Alternative would result in zero whales killed by hunting versus Alternative 2, which could result in up to 11 PCFG whales killed by hunting over 6 years (Table 4-14).

14. Cumulative effects and the future health of the ENP gray whale population in the face of climate change and other threats

Several commenters on the DEIS and SDEIS raise concerns about waiving the take moratorium to allow a tribal hunt of ENP gray whales, asserting that the whales face an uncertain future from climate change, ocean acidification, and increased human activities such as shipping, ocean energy projects, and military exercises. Some commenters point to the ENP gray whale die-off in 1999-2000, as well as the current UME, as evidence of an uncertain future. Some commenters assert that our analysis is inadequate because it is limited to the project area. Some commenters express concern that lack of funds for future monitoring or the lag time associated with monitoring the population could result in delayed and untimely management responses to drops in abundance. Several commenters presented additional scientific information related to gray whale biology and threats that was not included in the DEIS or SDEIS.

Response

The FEIS contains a thorough discussion of the best available information regarding threats to the future viability of the ENP gray whale population (Subsection 3.4.3.6, Known and Potential Anthropogenic Impacts). This subsection specifically deals with climate change and expected future impacts to ENP gray whales in Subsection 3.4.3.6.11, Climate Change and Ocean Acidification. This subsection of the FEIS addresses threats to ENP gray whales across their migration range and life history, contrary to the assertion of some commenters that it is limited to the project area. The information contained in the FEIS is sufficient to support an analysis of the effects of the Tribe's proposal and alternatives on ENP gray whales (e.g., Subsection 4.4.3.2.1, Change in Abundance and Viability of the ENP Gray Whale Stock) as well as cumulative effects (Subsection 5.4, Gray Whales).

The FEIS analysis includes a number of scientific studies, including a 2008 report on ecological impacts of climate change by the National Academy of Sciences that noted there is only a very limited understanding of how global climate change might affect whole ocean ecosystems (Subsection 5.1.3.9,

Climate Change and Ocean Acidification). Contrary to the assertions of some commenters, this subsection does refer to gray whales. For example, we note that "Moore (2008) characterized gray whales as useful “sentinels” of climate change, citing various lines of evidence that the health and habits of gray whales seem to be tracking changes in the North Pacific and western Arctic ecosystems" and Bluhm and Gradinger (2008) who noted that "marine mammal species that exhibit trophic plasticity (such as gray whales that feed on both benthic and pelagic prey) will adapt better than trophic specialists" (Subsection 5.1.3.9, Climate Change and Ocean Acidification). We have examined the papers cited by commenters that were not included in the DEIS and found they do not change the conclusions in the DEIS. In the FEIS, we considered recent research since publication of the DEIS with respect to gray whales and climate change, and also found that they do not change the conclusions in the DEIS. We state that “recent research has affirmed this characterization and documented climate-related impacts to gray whale distribution, abundance, phenology, and calf production in the Pacific Arctic feeding grounds.”

The thrust of these comments is that the DEIS does not adequately account for threats to ENP gray whales that could have a cumulative impact when combined with the effects of the action alternatives. We disagree for the following reasons. First, it is reasonable to expect that if the Makah Tribe does not harvest any ENP gray whales, the Chukotka Natives will continue to harvest them instead, as they have since the United States originally secured an ENP gray whale quota on behalf of the Makah Tribe and entered into a bilateral agreement with Russia to share the quota. Even if the Chukotka Natives did not harvest the Makah Tribe’s share of the quota, the number of whales not killed in a Makah hunt (a maximum of 7 per year under Alternative 2 or a maximum of 5 over two years under Alternative 7) is so small (less than a tenth of a percent of the ENP gray whale population) that the effect would be undetectable (Subsections 4.4.3.2.1 and 4.4.3.7.1, Change in Abundance and Viability of the ENP Gray Whale Stock). In addition, the purpose of a cumulative effects analysis is to ensure that the agency has considered whether there might be effects to a resource beyond those identified in the analysis because they would combine with the effects of other factors to in some way magnify those effects. Given how minor the effects of a tribal hunt would be on the ENP gray whale population, it is extremely unlikely that those minor effects would accumulate with the effects of other threats to result in effects not considered in the FEIS.

The die-off of ENP gray whales between 1998 and 2000, as well as the current UME, remain a concern, though the recovery of the population from that event is encouraging. The FEIS describes that event and reviews the scientific literature analyzing that event (Subsection 3.4.3.1.5, Strandings). While it is difficult to draw inferences about future abundance trends based on the die-off, the ENP stock is known to

experience large-scale fluctuations in abundance. The population has shown the ability to recover from these declines which may represent short-term events that do not result in any detectable longer-term impacts to the population (Eguchi et al. 2023a). The FEIS evaluates potential scenarios for the future of the population in the discussion of cumulative effects (Subsection 5.4, Gray Whales). In addition, all of the action alternatives include a management regime that would respond to a decline in PCFG abundance, via a PBR calculation or low abundance thresholds, and Alternatives 6 and 7 include a 10-year limit on hunt regulations to provide an opportunity for managers to reconsider any hunting regime based on experience. Changes in the PCFG abundance, should they occur, can also be considered when issuing a hunt permit.

Past, present, and reasonably foreseeable future actions considered in our cumulative impact analysis included: harvest, shipping, fisheries, tourism, marine energy and mining projects, scientific research, natural mortality, climate change and ocean acidification, U.S. government policy, and military exercises (including Navy sonar). Chapter 4 of the FEIS examines the effects of the proposed action and alternative actions on affected resources. Chapter 5 examines the effects of other actions to determine whether the proposed action, when combined with these other actions and stressors (e.g., climate change), will have effects beyond those analyzed in Chapter 4. The cumulative effects analysis must be sufficient for that purpose but need not provide an exhaustive quantitative analysis of every activity that may affect a given resource. Section 5.4, Gray Whales, of the FEIS analyzes the factors affecting the overall ENP population and concludes that these factors are likely to similarly affect PCFG whales.

The FEIS presents an extensive analysis of the status of the ENP gray whale population, more than sufficient to support an analysis of the effects of the proposed action considered alone and in combination with other past, present, and reasonably foreseeable future actions. The individual factors mentioned in this comment are described and considered in the FEIS.

15. Use of modern weapons

Several commenters assert that if the Makah Tribe wants to have a traditional whale hunt, they should use only traditional weapons and not modern weapons such as rifles and motorized vessels. Other commenters support the Tribe's proposed use of both traditional and modern weapons. Some commenters offer opinions against or in favor of particular weapons, such as a .577 caliber rifle or penthrite grenades.

Response

Section 104 of the MMPA requires that if the take moratorium is waived and animals are killed, the method of killing must be "humane," which the MMPA defines as "that method of take which involves the least possible degree of pain and suffering practicable to the mammal involved." The IWC has focused on reducing the time to death of a whale (i.e., reducing the amount of time between the strike and death of a whale) to improve the humaneness of whaling (IWC 2004; IWC 2007; IWC 2018a). The Makah Tribe proposes to use both traditional and modern methods for hunting whales to balance the preservation of traditional cultural methods with safety and the need for increased hunting efficiency (see Subsection 2.3.2.2.10, Proposed Hunting Method). The Tribe's proposal to use a .50 caliber rifle, fired by a rifleman on board a motorized vessel, to dispatch a harpooned whale is in consideration of MMPA requirements as well as the safety of the public and hunting party. The use of modern technologies (e.g., support vessel, rifle) will also help ensure that the hunt is humane by reducing the time to death over using traditional measures. The FEIS also examines the possibility of using a darting gun with a penthrite grenade.

16. Amount of time allowed to comment on the DEIS

Several commenters raised concerns that the initial 100-day comment period was not sufficient given the size and complexity of the DEIS. This comment was raised again for the initial 45-day comment period on the SDEIS.

Response

For the DEIS and SDEIS, the comment periods were extended beyond the initial deadline. The DEIS was published on May 9, 2015. On May 29, 2015, the EPA published a Federal Register notice (80 FR 30676) at our request that extended the 90-day comment period by an additional 50 days, until July 31, 2015. The SDEIS was published on July 1, 2022. On August 12, 2022 the EPA published a Federal Register notice (87 FR 49827) at our request that extended the 45-day comment period by an additional 60 days, until October 14, 2022. On October 28, 2022, the EPA published another Federal Register notice (87 FR 65202) at our request, reopening the comment period for an additional week, until November 3, 2022.

17. Lawfulness of a waiver

Several commenters on the DEIS and SDEIS assert that if NMFS waives the MMPA take moratorium and authorizes a whale hunt by the Makah Tribe, NMFS will be "breaking a law" and undermining the MMPA.

Response

We disagree that a waiver of the take moratorium and authorization of a gray whale hunt by the Makah would amount to "breaking a law." The MMPA authorizes waivers of the "take" moratorium if the Secretary of Commerce determines that the waiver would be compatible with the conservation standards in the MMPA (16 U.S.C. § 1371(a)(3)(A)). Preparation of the FEIS is one step in the full evaluation of the Tribe's request to waive the MMPA take moratorium. As provided for in the MMPA, that evaluation includes initial and final waiver determinations, formal rulemaking, and permit processing if a waiver is granted. For a more detailed discussion of the waiver process, see Subsections 1.2.3.3 and 3.17.3.1 of the FEIS. NMFS's final decision in response to the Tribe's request is subject to judicial review.

18. Maintenance of a WNP photo-ID catalog in light of changing U.S.-Russia relations

Several commenters on the SDEIS expressed concerns over the ability of the U.S. government to maintain access to Russia's WNP gray whale photo identification catalog. These commenters suggest that shifting relations between the United States and Russia beginning in early 2022 could significantly impair efforts to compare struck or harvested whales with the WNP catalog, or prevent researchers from accessing updated information to maintain the catalog, resulting in missing information that could lead to misidentification of WNP gray whales.

Response

The Russian Gray Whale Project (RGWP) has provided a long time-series (1994-2022) of photo-ID and genetic data used in the assessments of WNP gray whales, including those conducted by the Scientific Committee of the IWC and others (e.g. IUCN, NOAA/NMFS). In 2021 and 2022, research on WNP gray whales continued, conducted by the RGWP, as has been done since 1994. Summary reports of this research have been reviewed by the IWC during their annual meetings.

In light of the Russian invasion of Ukraine, concern has been expressed about the ability of researchers to continue collecting data on gray whales in the WNP off Russia. Fortunately, thus far the work of the RGWP has been able to continue collecting photo-identification data off Sakhalin and Kamchatka and, in turn, providing information to the IWC. In tandem with the work of the RGWP, a similar but separate photo-ID program funded and directed by industry was initiated off Sakhalin in 2002. The status of this industry-funded research effort is presently unknown as a result of limited information exchange following the onset of the Russian invasion of Ukraine. While it has been expected for many years that a common RGWP/Industry photo-ID catalog and database would eventually become available, to be managed under the auspices of the IWC, this objective has never been accomplished. That being said, the

1994-2021 catalog maintained by the RGWP (Dr. Alexander Burdin, PI) is archived with the IWC's Secretariat and is openly available.

The IWC has repeatedly commended the RGWP for making available its 25+ year photo-ID catalog, providing access to science and conservation practitioners in general. It is hoped that continued collection of data in the WNP (2023 and beyond) by the RGWP will happen and that provision of related data summaries and photo-identification images will be possible despite the aforementioned geopolitical situation in Russia and Ukraine.

19. Ongoing UME

Several commenters on the SDEIS opined that NMFS' analysis of the ongoing (2019 to present) UME was inadequate, expressing concern about the possible continued decline and low calf production. Some commenters also noted that impacts of the UME on the PCFG whales should be examined. One commenter expressed that a waiver should not be granted for a population that is currently undergoing a UME.

Response

In 2019, NMFS declared a UME for the ENP stock of gray whales that is still ongoing as of publication of this document. In the FEIS, we use the best available science and all known information regarding the UME to put the analysis of the alternatives in context. While as many carcasses are being collected and studied to the extent possible, there are still several open questions regarding the UME. As described in the SDEIS and FEIS (Subsection 3.4.3.1.5, Strandings):

> The full extent of the mortality from this event is unknown. Although some carcasses have been recovered, it is likely that many carcasses either sank, washed out to sea, or stranded in remote locations and were unobserved by humans. However, it is possible to estimate mortality resulting from this UME through ongoing population surveys conducted by NMFS, and noted above in Subsection 3.2.1.2. The current UME coincides with a recent 46 percent decline in abundance observed in the 2019/2020 survey (Stewart and Weller 2021a; Eguchi et al. 2022a; Eguchi et al. 2023a).
>
> NMFS has relied on the West Coast Marine Mammal Stranding Network for compiling reports of stranded animals, collecting data, conducting necropsies, and collecting samples from carcasses when possible in Washington, Oregon, and California. So far, full or partial necropsies have been performed on just a few of the stranded animals. Samples can be difficult or impossible to collect

> if the whale has become too decomposed or has stranded in an inaccessible location. NMFS does not mandate what necropsy data to collect. However, stranding network partners often record as much basic data as possible (referred to as Level A data), such as the state of decomposition and condition of the animal, the location of the stranding, and a list of samples that were collected, if any. Some but not all of the stranded whales have shown evidence of emaciation, but more research is needed to determine the cause(s) of the UME."

NMFS used the most recent abundance estimates in the FEIS analysis, which accounts for the current UME's impacts on the ENP population. From 2016 to 2020, the ENP gray whale population experienced a 23% decline in abundance, from 26,960 (Durban et al. 2017) to 20,580 (Stewart and Weller 2021a). When taking into account the current (2023) population size of 14,526, the overall population decline from 2016 to 2023 was 46% (Eguchi et al. 2023a). In 2023, NMFS published a Technical Memorandum that showed nearly a doubling in the number of calves compared to the year prior (Eguchi et al. 2023b). However, calf counts are still much lower than in years prior to the current UME. While it is impossible to predict how long the current UME will last, our FEIS analysis uses all the available information to assess the impact of the alternatives in light of a potential, and ongoing, UME. An ALJ recommended that the Secretary consider setting a lower limit on the ENP abundance, below which hunting would not be permitted (Recommended Decision, pg. 151). Comments on the recommended decision were in support of and opposed to this recommendation. Nevertheless, commenters recommended a range of low abundance thresholds. Alternative 7 considers the effects of the alternative under four scenarios (no abundance threshold and three low abundance thresholds).

Furthermore, the IWC conducts regular Implementation Reviews that, among other things, ensure that catch limits set by the Commission meet the conservation objectives of the IWC given the available data (e.g., population abundance and trends, reproduction and survivorship, and environmental conditions). The IWC conducted its last Implementation Review in 2020 and has reviewed the proposed management plan (that matches the Preferred Alternative in the FEIS) as recently as 2023. As stated in the FEIS (Subsection 3.4.3.3.4, ENP Status, Carrying Capacity, and Related Estimates [IWC Implementation Review of ENP Gray Whales]:

> After a review of the Makah Management Plan in 2018 (IWC 2018a), the IWC concluded that levels of harvest and other human-caused mortality are sustainable and that the management plan meets the IWC's conservation objectives for the ENP stock. The most recent Implementation Review occurred in 2020 (IWC 2021), and the Scientific Committee recommended that "Gray

> Whale SLA and the Makah Management Plan remain the appropriate basis for the provision of advice on the Chukotkan and proposed Makah hunts." In 2023, the Scientific Committee reviewed new information on ENP gray whale abundance and stock structure and concluded that the SLA and Makah Management Plan are robust to the current UME as well as future mortality events (Punt et al. 2023, IWC 2023)."

It is currently unknown how the UME may be affecting the PCFG. To date, only two known PCFG animals have died during the current UME; however, it is not clear whether they were part of the UME (J. Calambokidis pers. comm., Cascade Research Collective, October 23, 2023). Although the abundance estimate for the ENP stock demonstrated a 46% decline from the 2015/2016 to 2022/2023 abundance surveys, the PCFG abundance estimate has not experienced a proportional decline from pre-UME levels to 2020 (Harris et al. 2022). However, it is important to note that this assessment (Harris et al. 2022) is only through 2020, just one year into the UME. NMFS and other researchers conduct annual monitoring of the PCFG population through coastal surveys in Oregon, Washington, and British Columbia (e.g. see Calambokidis et al. 2019). As such, abundance estimates have been produced through regular reports since the mid-1990s. Given the time delay with photo-identification processing and modeling efforts, the PCFG abundance estimates are on a 2-year time lag. This also occurs because the definition of a PCFG is any whale seen between NCA and NBC in two or more years. Animals need the chance to be seen a second time in at least one year following in order to be classified as a PCFG. Alternative 7 (Preferred) incorporates measures (i.e., lower limits on the mean and minimum PCFG abundance estimates below which hunting would cease) to address concerns about declines in the PCFG.

20. PCFG Abundance "Dimmer Switch"

Several commenters on the SDEIS suggest the use of a "dimmer switch" in regulating the level of PCFG harvest in addition to the low abundance thresholds included in the Preferred Alternative (Alternative 7). One commenter noted that there can be a delay of two or more years between PCFG abundance surveys and their results due to the time required for photo-ID matching. Another commenter suggested that NMFS disregarded the ALJ's recommendation that a dimmer switch for the PCFG be included in the Preferred Alternative to limit strikes "if there are early signs of decline, rather than waiting for more extensive decline, to cease it entirely."

Response

Alternative 7 (Preferred) of the FEIS includes two stop-hunt triggers for PCFG gray whales: (1) a strike limit of 16 PCFG whales over the course of the 10-year waiver period, up to 8 of which may be female

and (2) a low-abundance threshold of 192 whales (N) or 171 whales (Nmin) based on the most recent or forecasted abundance estimates. Table 4-14 depicts the maximum number of PCFG whales that may be killed under each alternative over a 10-year period if the low abundance thresholds are not triggered. Under Alternative 7, the maximum number of PCFG whales that may be killed is 16 over the 10-year waiver period, with an additional limit of eight strikes on PCFG females. However, it is unlikely that 16 would actually be killed, given the proportion of PCFG whales present in the Makah U&A (27.3 percent PCFG whales) during the winter and spring months .Using these mixing proportions and assuming the full allowable strike limits are authorized and used, it is more likely that no more than 14 PCFG whales would be killed over 10 years (see Potential Number of ENP and PCFG Whales Killed; Likelihood of Striking a WNP Whale; Likely Number of Whales Harvested).

Section 216.114(a) of the proposed regulations (84 FR 13604) states that the Regional Administrator must "notify the Makah Indian Tribe in writing of the maximum number of PCFG whales, including females, that may be struck during the upcoming hunt season." The regulations also outline a hunt permitting process, wherein the initial hunt permit "may not exceed three years from its effective date, and thereafter the duration of a hunt permit may not exceed five years," (§216.113(a)(1)). The regulations do not require NMFS to authorize the full number of allowable strikes or issue permits lasting the maximum possible duration. Rather, NMFS can further limit strike limits and the number of days that hunting may occur during the hunting seasons The provisions set forth under Alternative 7 and the proposed regulations already allow NMFS to adopt a "dimmer switch" approach in the event that the PCFG abundance estimate shows signs of decline above the low abundance threshold.

The comment regarding the ALJ's recommendation is misleading. The ALJ did not recommend that NMFS adopt a dimmer switch for the PCFG, but rather agreed that the existing language of the proposed regulations already incorporated such a provision. In his recommended decision, the ALJ states, "Considering the existing language to constitute a 'dimmer switch,' which would be determined as part of the permitting process, accords with the MMPA's conservation principles."

21. Managing "Sounders" as a separate population

Some commenters on the DEIS and SDEIS suggested that the "Sounders," a group of ENP gray whales that frequent the Puget Sound during the spring while en route to the Arctic feeding grounds, should be managed separately from the ENP stock given their defined habitat use and there should be specific mitigation efforts to avoid Sounders in a potential hunt.

Response

Cascadia Research Collective's website notes that "The North Puget Sound gray whales, also known as the "Sounders," represent roughly a dozen individual whales, part of the larger population of the Eastern North Pacific gray whales. They are also sometimes referred to as the Puget Sound Regulars or the Saratoga Grays. During their northern migration from Baja California, these individuals break off of the migration route to feed on ghost shrimp for 2-3 months each spring (approx. March-May) in the North Puget Sound waters. They then continue north to the Bering and Chukchi seas for summer feeding." Further, FEIS Subsection 3.4.3.4.1, PCFG Population Structure, notes that "[a]lthough interior waters making up Puget Sound are within the PCFG latitudinal boundaries of 41°N to 52°N, whales sighted in Puget Sound…are considered outside the range of the PCFG. Previous research has found that the few whales sighted in Puget Sound (especially in northern Puget Sound) are typically seen only in the spring, are less likely to be seen in multiple years and regions, and likely represent migratory animals." As such, gray whales that occupy the Salish Sea are part of the broader ENP gray whale population. They are not recognized as a marine mammal population stock or a feeding aggregation.

Given that the range of the ENP migratory animals encompasses the Puget Sound region discussed above, we considered and included a discussion of the Salish Sea (i.e., inland waters of Washington State and southern BC) as part of the affected environment in the SDEIS (Subsection 3.3.3.3.1, Physical Features and Processes [Dynamic Processes and Variability]). As stated in the FEIS, Subsection 3.3.1, Introduction, "we have included information about the Salish Sea in this chapter to clarify its overlap with the action area and the potential for the action alternatives to have indirect effects on resources in these waters."

Although whales that use the Salish Sea are not treated separately in the FEIS analysis, none of the FEIS alternatives contemplate a hunt in the Strait of Juan de Fuca, making it unlikely that a hunt would affect one of the dozen or so Sounder whales. This chance is further reduced given their small number in a population of over 14,000 migrating whales.

22. Authorization of training activities

One commenter on the SDEIS asserts that NMFS failed to consider all reasonable alternatives by not analyzing an alternative in which hunting but not training is authorized. They argue that such an alternative would represent a mid-range alternative with fewer impacts to gray whales.

Response

Alternative 2 (Tribe's Proposed Action) includes a training and certification program to ensure that the hunt is carried out in as efficient, safe, and humane a manner as practicable (see Subsections 3.4.3.5.6, Training and Weapons Improvement, and 3.15.2.2, Weapon Safety Regulations and Authorities, of the FEIS). NMFS included these training and certification requirements in all action alternatives and did not contemplate an action alternative that would authorize hunting without allowing tribal members who engage in whaling to train. The training activities that the commenter refers to include positioning a vessel that does not carry weapons ordinarily used to strike a whale within 100 yards of a gray whale (defined in the proposed regulations as a training approach) and attempting to contact a gray whale with a blunted spear-like device that is incapable of penetrating the skin of a gray whales (defined in the proposed regulations as a training harpoon throw).

The FEIS analyzes the effects of training activities on gray whales and other living marine resources, as well as on public safety. While we agree that training activities may increase the total amount of adverse effects experienced by gray whales through interactions such as close approaches and training harpoon throws, training also allows for increased efficiency in a hunt. NMFS' stated purpose in the FEIS is to implement the Whaling Convention Act (WCA) in addition to the MMPA and the Treaty of Neah Bay (see Subsection 1.3.1, Purpose for Action). The implementing regulations of the WCA prohibit whaling captains from engaging in whaling in a manner that is wasteful (50 C.F.R. 230.4(k)). Therefore, maximizing the efficiency of the hunt by reducing the number of struck and lost whales aligns with the purpose set forth by NMFS in the FEIS. In a report to the 58th meeting of the IWC, the Alaska Eskimo Whaling Commission reported a multifaceted approach to improving the efficiency of their hunt of bowhead whales. One component of that approach was placing a renewed focus on hunter training, including training younger harpooners in the more traditional methods that will be adopted by the Makah Tribe (as opposed to the use of penthrite grenades, which have become more common in the Alaska hunts but are less likely to be adopted in the Makah hunts). Historically, Alaska Native hunters lost approximately 50% of the whales they struck. Through their dedicated efforts to increase their efficiency, including their heavy focus on training, they were able to increase this rate to nearly 80%, a level that they have maintained in the years since (AEWC 2006, 2018).

Training may also facilitate reducing the time to death of any struck whale, as harpooners and shooters can learn to target more vulnerable areas that are most likely to result in a faster death (AEWC 2006). As stated in our response to substantive comment No. 15, Section 104 of the MMPA requires that if the take moratorium is waived and animals are killed, the method of killing must be "humane," which the MMPA defines as "that method of take which involves the least possible degree of pain and suffering practicable

to the mammal involved." The IWC has focused on reducing the time to death of a whale (i.e., reducing the amount of time between the strike and death of a whale) to improve the humaneness of whaling (IWC 2004; IWC 2007; IWC 2018a). Therefore, training activities are essential to improving the humaneness of the hunt and considering an alternative in which hunting is authorized while training is prohibited would go against NMFS' stated purpose to implement the MMPA alongside the WCA and Treaty of Neah Bay.

The FEIS also analyzes the effects of the action alternatives on public safety and concludes that weapons-related injuries could be reduced by training (see Subsection 4.15.2.1, Injury from Weapons). These injuries include those to Makah Tribal hunters as well as hunt observers and spectators.

Responses to Comments on the Draft Environmental Impact Statements on the Makah Tribe Request to Hunt Gray Whales

Responses to Comments on the Draft Environmental Impact Statements

INTRODUCTION:

On March 13, 2015, National Marine Fisheries Service (NMFS) released a Draft Environmental Impact Statement (DEIS), pursuant to the National Environmental Policy Act (NEPA), concerning the Makah Indian Tribe's February 2005 request to resume limited hunting of eastern North Pacific (ENP) gray whales for ceremonial and subsistence purposes. The DEIS was available for public review for 90 days (80 FR 13373, March 13 2015) and, in response to several stakeholder requests, later extended by an additional 50 days (80 FR 30676, May 29, 2015). NMFS held two public meetings on the DEIS on April 27 (Seattle, WA) and April 29 (Port Angeles, WA) (80 FR 14912, March 20, 2015). More than 57,000 comments on the 2015 DEIS, by mail, fax, email, and submissions to www.regulations.gov (Docket ID: NOAA-NMFS-2012-0104). Over 99% of comments were submitted as form letters. Individual commenters on the DEIS included state and federal entities, tribal governments, and both nonprofit organizations and interested individuals from the United States and around the world.

NMFS West Coast Region provided draft responses to comments on the 2015 DEIS in November 2019 as part of the record for the hearing before the Administrative Law Judge which were incorporated into the FEIS. The first document (see Appendix E) provide responses to all of the comments raised (excluding duplicate form-letter comments as practicable). A separate document included draft responses to 17 topics frequently raised by commenters.

NMFS published a Supplemental DEIS (SDEIS) on July 1, 2022 (87 FR 39417). The SDEIS was available for public review for 45 days. During the comment period, we received a request to extend the public comment period and agreed to extend the public comment period by 60 days, to close on October 14, 2022 (87 FR 50319, August 16, 2022). On October 6, 2022, we received a second request to extend the public comment period. While that request was received too late to allow for an extension notice, NMFS reopened the comment period from October 28 through November 3, 2022 (87 FR 64454, October 25, 2022). We received 47 comments via email, mail, and submissions to www.regulations.gov (Docket ID: NOAA-NMFS-2012-0104). Similar to DEIS, commenters on the SDEIS included federal entities, tribal governments, and both nonprofit organizations and interested individuals from the United States and around the world.

We provide responses to all of the comments raised on the SDEIS in the table below. The content in the comment letters is parsed into multiple rows in the table (see Document ID) into multle rows to facilitate the readers understanding of our responses. All of the comments contained in this table are available for viewing in their original form at the regulations.gov docket noted above. We have also developed a separate document that includes our responses to frequent and substantive comments received on the DEIS and SDEIS (Appendix D).

Document ID	Name	Date	Comment	Response
457	Young, Scott	7/7/22	The torture & murder of whales is wrong regardless of historical, traditional, cultural, religious whaling operations. With 8 BILLION people on earth maybe it's time we start giving other fellow sentient living-beings a little respect & consideration to LIVE without threat of torture & murder from us.	Comment noted.
458	Anonymous	7/7/22	After reviewin the 2015 DEIS and 2022 SDEIS, I would like to express my support for Alternative 2, the alternative proposed by the Makaw. I support the Makaw in their efforts to take a conservation-focused approach to their treaty-based authority to conduct whaling in their territory. To take any other action would be a flagrant violation of the terms of the treaty, which is enshrined as the law of the land under the Constitution of the United States. I believe the MMPA and other more recent laws do not extinguish or modify the terms of the Treaty of Neah Bay. Please do the right thing and adopt Alternative 2 as quickly as possible. The ongoing delay in addressing this Makaw request from more than 17 years ago is an embarrassment.	Comment noted.
459	Parks, Travis	7/18/22	As a non tribal person I stand in solidarity with the Makah people's need to resume traditional hunting practices. It is especially important to support other hunters at a time when traditional hunting practices are under attack by non-scientific animal affinity groups who seek to deprive everyone who doesn't subscribe to their world view of their unenumerated hunting rights.	Comment noted.
460	Cole, Shirley	7/18/22	I support the implementation of Alternative 2, the tribes proposed action. From my understanding of the population of ENP Gray Whales, the number of whales they can take under this alternative is a non-factor in both the long term and short term success of the population. The rights under the treaties, and in turn the culture of the tribe, should not be thrown out over emotional claims by people who are far removed from the tribe and its culture. Tribes did not cause the near extinction of whales, the industrial use of them by modernizing nations did, and the tribes are the	Comment noted.

Document ID	Name	Date	Comment	Response
			ones who have taken the burden of suffering due to the actions of other people.	
461	Butcher, Nicholas	7/20/22	I Nicholas Butcher, fully support the Makah tribes traditional and treaty rights to hunt whales. I believe they will do so in a way that will respect the animals and the resource as a whole. I believe it is their natural right from birth to harvest these animals to to sustain their lives as well as traditional life ways and beliefs. It is a great tragedy that they had to give up these practices long ago due to over hunting (not by them) and government regulation. I whole heartily reject, and I am greatly offended, that the killing of a whale or any animal for that matter makes these tribal people or anyone that chooses to do so "uncivilized" and shouldn't exist in this era. That type of bigotry and hatred has no place in our society. And frankly I would find it even more reprehensible if the government chose to take part in this discrimination. Uphold the natural and cultural rights of the Makah tribal people.	Comment noted.
462	Kubecka, Jonah	7/21/22	Ill have it be known I 100% support the Makah tribes right to harvest Grey whales in the Pacific Ocean. The tribe has a treaty right, and the Grey Whale populations documented appear to be sustainable enough for harvest. As it appears in the draft, such a minimum harvest over the course of years should have little to no impact on the whale population as a whole. Please stop asking the public on issues that should not be up to the public. Do not listen to those who have nothing at stake here. This is between the Federal Government and the Makah tribe, not animal rights activists or agendists.	Comment noted.
463	EPA	7/28/22	The U.S. Environmental Protection Agency has reviewed National Oceanic and Atmospheric Administration's National Marine Fisheries Service's July 2022 Supplemental Draft Environmental Impact Statement for the Makah Indian Tribe of the Makah Indian Reservation's (Makah Tribe's) Request to Hunt Eastern North Pacific Gray Whales (CEQ Number	We note the background/summary information. The 10-year waiver period is addressed in Sections 2.3.6 & 2.3.7

Document ID	Name	Date	Comment	Response
			20220086, EPA Project Number 22-0030-NMFS). EPA has conducted its review pursuant to the National Environmental Policy Act and our review authority under Section 309 of the Clean Air Act. The CAA Section 309 role is unique to EPA and requires EPA to review and comment publicly on any proposed federal action subject to NEPA's environmental impact statement requirement. The SDEIS evaluates the potential environmental impacts associated with a request by the Makah Tribe to resume limited hunting of eastern North Pacific gray whales for ceremonial and subsistence purposes. The project area includes the Makah Tribe's usual and accustomed fishing grounds west of the Bonilla-Tatoosh Line. The SDEIS evaluates a composite alternative (Alternative 7) which combines various elements from alternatives previously analyzed in the 2015 DEIS, limits the likelihood that tribal hunters would strike or harm a western North Pacific gray whale, and ensures hunting does not reduce the Pacific Coast Feeding Group below stable abundance. EPA did not identify additional significant environmental concerns to be addressed in the Final SEIS and recommends the Final SEIS include information suggested in our July 2015 recommendations for the DEIS explaining why 10-years would be an appropriate duration limit for the waiver. Please continue to include all best available and relevant information in the Final SEIS and Record of Decision. Thank you for the opportunity to review the SDEIS for this project. If you have questions about this review, please contact Emily Bitalac of my staff at (206) 553-2581 and bitalac.emily@epa.gov, or me, at (206) 553-1774 or at chu.rebecca@epa.gov.	

Document ID	Name	Date	Comment	Response
464	AWI	8/1/22	On behalf the undersigned organizations, the Animal Welfare Institute respectfully requests a 45-day extension of the public comment period for the Supplemental DraftEnvironmental Impact Statement on the Makah Tribe's Request to Hunt Gray Whales (SDEIS). 87 Fed. Reg. 39,804 (July 5, 2022). If granted, the new deadline for comments would be September 29, 2022. This extension is needed to ensure that all interested stakeholders, regardless of their position on whaling or whether the Makah Tribe should be allowed to resume a hunt, can adequately participate in the ongoing decision-making process by providing informed and substantive c comment to the National Marine Fisheries Service (NMFS). Specifically, NMFS should grant this request for the following reasons: 1. The SDEIS relies extensively on an analysis by Harris et al. in its analysis of the impacts of the hunt on Eastern North Pacific, Western North Pacific, and Pacific Coast Feeding Group gray whales. NMFS's assessment, informed by the Harris et al.(1) analysis, implicates all six action alternatives, including the new preferred alternative. Yet, the Harris et al. analysis, to be published as a NOAA Technical Memorandum, is currently "in prep" and therefore not available to those interested stakeholders reviewing the SDEIS. An Internet search failed to locate a copy of the Technical Memorandum. It is entirely inappropriate for NMFS to publish the SDEIS for public comment when a critical document underlying much of the environmental impact analysis in the document is not available. Indeed, not publishing such a critical document prior to publishing and seeking public comments on the SDEIS is a clear violation of the National Environmental Policy Act, as it prevents interested stakeholders from having access to information critical to the analysis. In order to afford the public an adequate opportunity to prepare and submit informed and substantive comments, NMFS should suspend the current comment period, publish the Harris et al. Technical Memorandum, and then resume the public comment process with a duration of at least 90 days. At a minimum,	See Section 1.5.3 for a summary of the public comment process, including extensions granted, on the DEIS and SDEIS.

Document ID	Name	Date	Comment	Response
			assuming NMFS publishes the Harris et al. Technical Memorandum by the end of July 2022, NMFS should provide the requested 45-day extension in the comment deadline to ensure that interested stakeholders have sufficient time to obtain and review the Technical Memorandum to incorporate the information in informed and substantive comments. 2. The SDEIS analyzes several new issues that have not previously been subject to environmental impact review, including the proposed odd/even year hunt structure, the ongoing Unusual Mortality Event (UME) affecting gray whales that began in 2019, and the impact of marine heatwaves on marine ecology. Indeed, as explained in the Federal Register notice announcing its intent to prepare a SDEIS, NMFS elected to conduct the analysis in order to incorporate information regarding the 2019 UME, take into consideration the Administrative Law Judge's recommended decision, and expressly identify the hunt proposal as a separate action alternative. 85 Fed. Reg. 11347 (Feb. 27, 2020). Considering the complexities of the proposed hunt structure, its potential impact on endangered Western North Pacific gray whales, Eastern North Pacific gray whales, and Pacific Coast Feeding Group gray whales (depending on the timing of the hunt) as well as the diverse factors likely contributing to the UME, including ocean warming and the ongoing paradigm shift in the ecology of Arctic marine ecosystems, extending the comment deadline would provide all stakeholders with an opportunity to more thoroughly assess the quality of the analysis contained in the SDEIS in light of the relevant scientific literature.3. New information, including the 2022 report of the International Whaling Commission's Scientific Committee (IWC SC), has only recently become available. This information is highly likely to be relevant to NMFS's analysis contained in the SDEIS. 3 The 2022 IWC SC report, which includes information about gray whales, is based on dozens of underlying studies submitted to the IWC SC for its review during its virtual meeting in May 2022. Only persons who were registered for the	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			meeting had access to the studies/papers at that time. The IWC SC rules strictly forbid the sharing of such studies/papers with those who were not registered for the SC meeting. Many of NMFS's scientists participate in the IWC SC and are aware of these rules, as well as the fact that the 2022 IWC SC report would be informative with respect to gray whales. It would have been reasonable for NMFS to wait until the publication of the IWC SC report and related annexes and papers before completing its analysis and opening this comment period. On the other hand, those individuals not registered for the IWC SC, including many of the signatories to this letter, were unable to access these studies/papers until July 19 at the earliest (see footnote 3). Therefore, extending the comment deadline by the requested 45 days to provide all interested stakeholders with additional time to access and review the 2022 IWC SC report and underlying relevant papers is warranted. 4. The history of this decision-making process extends back decades and, consequently, the public record for this case is immense. In addition to the two environmental assessments on Makah whaling dating back to the late 1990s and the initial Environmental Impact Statement (EIS) from 2008, NMFS published a 2015 EIS, which NMFS has now supplemented through its SDEIS. 4 Furthermore, the waiver process under the Marine Mammal Protection Act (MMPA), including proceedings before an Administrative Law Judge, amassed an enormous public record of documents, data, and other evidence.5 While some signatories to this letter are familiar with these documents, others, including those who have not previously engaged in this issue, are not. Authorizing an additional 45 days for comment on the SDEIS provides stakeholders,including others not named below, with time to evaluate some, if not all, of the sizeable record underlying this decision-making process.5. The requested extension would benefit NMFS and its decision-makers while not substantively impairing or harming the interests of any stakeholder. By granting this request, NMFS will afford stakeholders additional time to review the SDEIS, the immense	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			underlying record, and any new information, including the 2022 IWC SC report. The extension will result in more informed and substantive public comments, which can only benefit the government decision-makers. While all interested stakeholders would likely benefit from the requested extension, none would be harmed by the limited additional time for being sought for the preparation of informed and substantive comments. Such an extension would not prevent NMFS from issuing a final EIS in early 2023 as it intends to do. While we acknowledge the patience demonstrated by the Makah Tribe during this decision-making process, we note that even once the NEPA process has concluded, additional decision-making processes will be required (e.g., for an incidental take permit and to obtain an MMPA permit to authorize the hunting of gray whales). For the foregoing reasons, AWI and the undersigned organizations assert that the requested 45-day extension in the comment deadline for the SDEIS is warranted so as to insure that all stakeholders have an adequate opportunity to analyze all relevant information, assess the adequacy of the SDEIS, and prepare and submit informed and substantive comments. In particular, until and unless NMFS publishes the Harris et al. Technical Memorandum, it cannot expect stakeholders to provide informed and substantive comments.Thank you in advance for considering this request. Should you have any questions about this request and/or to inform AWI of the decision made by NMFS in response to this request, please contact me at georgia@awionline.org and/or DJ Schubert at dj@awionline.org .---------- 1. Harris, J., J. Calambokidis, A. Perez, J. Laake, and P. Mahoney. (in prep). Recent trends in the abundance of seasonal gray whales in the Pacific Northwest, 1996-2020. NOAA Technical Memorandum, Seattle, WA.2. The Council on Environmental Quality 1978 regulations implementing NEPA (which is the version of the regulations informing the SDEIS analysis as noted in the SDEIS), specify that “[n]o material may be

			incorporated by reference unless it is reasonably available for inspection within the time allowed for comment." 40 C.F.R. §1502.21. See also Conservation L. Found. v. F. Highway Admin., 630 F. Supp. 2d 183, 215 (D.N.H. 2007), finding that "Defendants cannot rely on the fact that they discussed the issue in the TSA to excuse their failure to directly address it in the FEIS because the TSA was not subject to public comment. CLF and other interested parties did not learn either that Defendants' failure to account for the Delphi Panel's population forecasts may have resulted in an understatement of Defendants' traffic projections by as much as thirty percent, or that the added traffic would produce a failing Level of Service south of Exit 1 and unacceptable Levels of Service between Exit 1 and Exit 3, until after Defendants released the TSA pursuant to a Freedom of Information Act request, after the close of the comment period on the FEIS. SR 913. Thus, the FEIS did not disclose sufficient information on this issue to permit meaningful public comment on either the effectiveness of the Four Lane Alternative as a traffic congestion control measure or the indirect effects that highway expansion could have on secondary road traffic and air quality issues."3.The report and associated annexes was originally published on July 12, 2022, but shortly thereafter, the report became temporarily unavailable until it was restored on July 13. While AWI had access to the report and associated annexes as of July 13 via a hyperlink in an email from the IWC announcing the availability of the report ,the public did not. AWI contacted the IWC Executive Secretary and Head of Science on July 19 to inquire as to when the report, its annexes, and associated papers would be available to the general public, including any stakeholder interested in the Makah whaling issue. The report itself did not become publicly available (via the IWC notification webpage, https://archive.iwc.int/pages/search.php?search=%21collection68&k=) until July 19, preventing anyone not registered for the SC meeting from accessing the report for the first two weeks of the current comment period.	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			The underlying papers that informed the conclusions and recommendations in the SC 2022 report were only made available on July 22, 2022 (see IWC notification IWC.ALL.424) at which time the IWC published a slightly revised version of the SC 2022 report.4. Many of those documents and other background documents are publicly available online at https://www.fisheries.noaa.gov/west-coast/marine-mammal-protection/makah-tribal-whale-hunt#:~:text=The%20Makah%20Indian%20Tribe%20has,gray%20whales%20(Eschrichtius%20robustus).On behalf of:California Gray Whale Coalition (United States); Centro Mexicano de Derecho Ambiental (México); Conservación de Mamíferos Marinos de Mexico México); Fundacion Antonio Haghenbeck y de la Lama IAP (México); Grupo GEMA del Mayab AC. 465	Coerver, Scott	7/22/22	I support the treaty secured rights of the Makah tribe to hunt gray whales. This population of gray whales is fully recovered and still increasing according to NOAA population data. There is no scientific reason to deny the Makah tribe's request. A limited harvest of gray whale will not have a population level impact Indigenou people hould not be denied their traditions or treaty rights without a justifiable cause. All data shows that	Comment noted.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			this population can support a sustainable harvest. Please allow the Makah to use this resource and practice the cultural traditions that they have had for thousands of years.	
466	Kroychik, Vitaliy	7/21/22	I am writing in support of the Makah tribe receiving approval to hunt whales as part of their traditional hunting practices. While there was a treaty in place granting those rights, the tribe voluntarily halted their hunts nearly 100 years ago due to conservation concern. Now that the population ha recovered to the point where traditional hunting practice can continue, it is not only correct to grant them the opportunity to continue their traditional practices but also morally right to allow those practices to start and continue with population monitoring. I would also like to note that the US government should provide protection for this activity from interference and abuse from animal rights groups which are often violent and destructive in their opposition to hunting in general. This would be no different than sitting outside and intimidating church service goers, or interfering with a fisherman by jet skiing around their boat. I would support providing the coast guard or the local marine authorities to arrest and prosecute those who interfere a hate crime.	Comment noted.
467	O'Connell, Thaddeus	8/8/22	I am stətíɬəm nəxʷsƛ̓áy̓əm̓ - a citizen of the Jamestown S'Klallam tribe. I support the Makah Tribe in their wonderful endeavor to hunt whales the way their ancestors have done for an untold many thousand of years, ie since time immemorial. It is explicitly allowed in their treaty- pursuant to the supremacy clause of the US constitution, this comment period seems like a formality. In my opinion, the Makah tribe does not need permission to hunt a whale, but they should nonetheless be granted it anyway. Whale meat has a much smaller carbon footprint than anything I could think of that you could ever buy in this globalized commodity supply chain. I raise my arms to the makah tribe for this noble quest.	Comment noted.
468	Anonymous	8/9/22	I support the Makah Tribe's ancestral right hunt Gray Whales.	Comment noted.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
469	Harner, Jacob	8/9/22	It is a right of the Makah, and they have been doing it forever. It is hypocritical for a western power to try to limit traditional hunting under the guise of environmentalism.	Comment noted.
470	Miedema, Ethan	8/9/22	The Makah have had their right to hunt whales protected by treaty, the highest law of the land, since their treaty with Isaac Stevens specifically mentioned whaling in 1855. It would be disgusting to even suggest undermining that crucial piece of their culture and symbol of sovereignty.	Comment noted.
471	H, W	8/9/22	The Makah people have been known to be inhabitants of the Pacific Northwest for more that 3,800 years and have been hunting and fishing the regional waters for their entire known existence as a means to sustain their lives, way of life and beliefs. We, as "modern day" people on the earth, have raped the seas of its plentiful bounties and are now trying to blame the native people of these lands for the dwindling numbers of species that are now considered at or near endangered. The hunt, of Makah people will have almost zero impact on the overall population of the North Pacific Gray Whale and therefor should be allowed to continue their natural, spiritual and historical way of life.	Comment noted.
472	Anonymous	8/9/22	It should be their right to hunt whale.	Comment noted.
473	James, Rajrf	8/9/22	I support the Makah tribes right to whale hunt.	Comment noted.
474	Dogan, Leonard	8/11/22	I believe it is the right of the Makah Nation to practice the forms of hunting that are sacred to them such as whale hunting. After being subject to genocide and loss of land, this is a minor concession that expresses the bare minimum recognition of their humanity.	Comment noted.
476	Anonymous	8/15/22	The practice of slaughtering whales for spriritual / ritualistic purposes must not be allowed. If the Makah expect to be respected as modern citizens of the world, they must not continue their barbaric ways. NOAA: Just say NO! Stop this, once and forever.	Comment noted.
477	Hansen, Cindy	8/16/22	Thank you for the opportunity to comment on the Supplemental Draft Environmental Impact Statement on the Makah Tribe Request to Hunt Gray Whales. I appreciate the effort that went into creating a composite	Introductory comment noted.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			alternative to put forth as the preferred alternative. I am very much in support of honoring tribal treaty rights, and I am sympathetic to the cultural losses all tribes have sustained. However, I do have some concerns about the hunt as currently proposed.	
			I am concerned about a hunt being approved when the species is the midst of an Unusual Mortality Event that has already claimed an estimated 25% of the population and is still ongoing. It includes not only high mortalities among all age and sex classes but also drastically decreased birth rates. We do not know how long this event will continue, what the final population numbers will be when it's over, and what the overall impacts will be to the Pacific Coast Feeding Group and Western Gray Whale sub-populations. If the UME is related to the impacts of climate change, it is likely only a matter of time until a similar event happens again, perhaps before the population has completely recovered. I ask you to take all of this into account in your final decision, and if a hunt is ultimately approved, that the ENP Abundance Threshold is set at c) N=18,000, as described in the DEIS.	See Appendix C Responses to Frequent and Substantive Comments #19-Ongoing UMESee also Section 3.4, Affected Environment-Gray Whales, and Section 4.4, Environmental Consequences-Gray Whales, of the FEISWith respect to the low abundance threshold, the comment is noted.
			I request that a section be added to the DEIS incorporating information about the "Sounders" or North Puget Sound gray whales, who do not appear to have been included in the document. The Sounders are a unique group of gray whales that, according to Cascadia Research Collective, originally discovered feeding areas in North Puget Sound during a past Unusual Mortality Event and other times of depleted food resources. Some of them have been returning to Puget Sound since 1990, and with another UME underway, new individuals have come in and joined the Sounders. Not only are the Sounders feeding here together but they are also interacting with one another and may even have established long term bonds. These whales are named, known as individuals, and beloved by thousands of people in Puget Sound and beyond. In normal non-UME years, the Sounders would be arriving in Puget Sound beginning in February or March and the last whales would typically leave by the end of	See Appendix C Responses to Frequent and Substantive Comments #21-Managing Sounders as a separate population

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			May During the current UME they are spending more time here on average, and in a few cases have even remained during the winter instead of migrating. As they depart Puget Sound to either continue their migration to the Arctic feeding grounds or join the PCFG, their travels may place them in the hunt area during any of the proposed timings. I ask you to please take this population under consideration in your final decision and make sure there are safeguards in place, perhaps through coordination with researchers and sighting networks, to protect them from a hunt.	
			Gray whales are known and loved by people all along their migration route, from Baja to Alaska, and a hunt, no matter how small the take, is going to cause great emotional distress to many, particularly those who have come to know some of these animals as individuals with unique personalities I ask you to please be considerate of this and take it into account much as possible. I would like to state again that I am supportive of honoring tribal treaty rights, and I realize that what I am asking may create challenges in accomplishing this. If the Makah are amenable to this, I would be fully supportive of negotiations to compensate them for whales not taken due to some of the safeguards I am suggesting Thank you for your time and consideration.	Comments regarding the connection people have to gray whales is noted.See Appendix C Responses to Frequent and Substantive Comments #9-Non-lethal action alternatives
478	Friends of Animals	8/16/22	Friends of Animals (FoA)1 submits this comment on Supplemental Draft Environmental Impact Statement Regarding the Makah Tribe's Request To Hunt Eastern North Pacific Gray Whales, 87 Fed. Reg. 39804. After careful review of the Supplemental Draft Environmental Impact Statement on the Makah Tribe Request to Hunt Gray Whales (SDEIS), as well as other pertinent studies and reports, Friends of Animals (FoA) concludes that the information and conclusions published in the SDEIS are inadequate to justify granting the request. Friends of Animals recommends that the request be denied. The SDEIS says that the legal justification for Makah hunting of eastern	See Appendix C Responses to Frequent and Substantive Comments #8-Treaty of Neah Bay. See Appendix C Responses to Frequent and Substantive Comments #9-Non-lethal action alternatives.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			North Pacific gray whales (Eschrichtius robustus) lies in the 1855 Treaty of Neah Bay which "expressly secures the Tribe's right to hunt whales." Friends of Animals has reviewed that treaty and discovered the referenced provision in Article 4, which says "The right of taking fish and of whaling or sealing at usual and accustomed grounds is further secured to said Indians in common with all citizens of the United States." Times have changed, and all citizens of the United States today do not have the right to hunt whales. The treaty's text binds the Makah rights to those of all U.S. citizens. This binding became more complete with the 1924 passage of the Indian Citizenship Act, which extended US citizenship to Native Americans. This precludes the U.S. Government from granting any waiver to the Marine Mammal Protection Act that is not also applicable to all U.S. citizens. Friends of Animals further understands that the human welfare provisions of Article 11 remain valid, and the U.S. Government is indeed obligated to provide support to the Makah, preferably with an updated 2022 appreciation of the intent of this article. Modern living has caused certain traditional practices to be abandoned – for example, Article 12 of the Treaty includes agreement that all slaves be freed. Whaling is another traditional practice that must be abandoned. It is proper, however for the U.S. Government to fairly compensate the Makah for having to forfeit traditional whaling. ---------- 1. FoA is an international animal rights organization incorporated in the state of New York since 1957 with roughly 200,000 members worldwide. FoA and its members seek to free animals from cruelty and exploitation around the world and to promote a respectful view of non-human animals, both free-living and domestic. Our goal is to free animals from cruelty and institutionalized exploitation around the world.	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			There are many traditional practices that society has had to abandon for various compelling reasons. Friends of Animals is headquartered in Connecticut, which once counted whaling as an important part of its economy. But concerns about endangerment and biological diversity, as well as the welfare of the individual whales themselves, have forced a closure of the whaling industry, and the conversion of some remaining whaling infrastructure to a museum. Other traditional practices, from segregation to child labor to corporal punishment have been discontinued in light of evolving social understanding and needs. The simple fact that an activity is "traditional" does not make it immune from being abandoned to meet modern ethical and practical norms.	See Appendix C Responses to Frequent and Substantive Comments #3-Makah Tribe's desire to revive its whaling traditionSee Appendix C Responses to Frequent and Substantive Comments #1-Potential for a hunt to cause pain or suffering to whales
			Turning to the merits of the SDEIS itself, the Statement proposes a "seventh alternative" to address the Makah request. But FoA concludes that the seventh alternative is no better than any of the other hunting options. The only attractive alternative is to prohibit killing whales. Friends of Animals seeks denial of the request because the arguments posited in the original Statement, as well as in the present Supplemental Statement, do not provide persuasive reasoning for waiving the provisions of the Marine Mammal Protection Act. Justification has not been made. Further, the present Supplemental Draft, like the original, is burdened by far too many qualifiers such as, "would depend on", "would probably limit", "should", "most likely", and "could be." This gives the sense that the authors are not fully confident in a document identified as a "Statement." Such qualifiers are scattered throughout the document, and on occasion become alarming. For example, in item 5.1.1 (page 94) there is a passage that says, "Therefore we continue to conclude that because whales are long-lived animals and take 6 to 12 years to mature it may take a long time to detect if Alternative 7 is affecting any whales as expected under	Comments on Alternative 7 noted. There is often a degree of uncertainty associated with scientific analyses and assessment of future effects of an action. Terms such as those cited in the comment are used to reflect the level of certainty with the statements made. This does not meant that we are not confident with those statements but rather that we acknowledge that, in some cases, there is some level of uncertainty..

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			current harvest models." "It may take" introduces an element of uncertainty within the anticipated consequences of the whale hunt. The possibility that the hunt will irreparably harm the entire whale population and place them on a path to extinction before the impacts of hunting have been detected further demonstrates that the request to hunt whales should be declined.	
			In addition, Friends of Animals objects to the use of stainless steel harpoons and .50 caliber rifles in the killing of gray whales. Steel harpoons are infamous for their cruelty. The .50BMG bullet is a weapon of war developed more than a century ago. It was designed to shoot enemy soldiers, not 40 ton whales. Both weapons depend greatly on accuracy. But accuracy is compromised when attempting to target a moving whale from a small boat that is constantly rocking with the sea. These weapons are feeble, inaccurate and constitute a barbaric torture that too often results in the protracted agony of a dying whale. The Hague and Geneva conventions prohibits the use of such weapons known to cause gratuitous suffering. If society can protect aggressive enemy soldiers from cruel weapons, why should we tolerate the use of similar weapons against innocent marine mammals? As recently as September, 2018, the International Whaling Commission has expressed its concerns with non-exploding harpoons, and this may be referenced at IWC/67/REP/04.	See Appendix C Responses to Frequent and Substantive Comments #1-Potential for hunting to cause pain or suffering to whales
			Friends of Animals draws attention to a special CNN report "Gray whales are dying along the Pacific coast" by Daniel Wolfe, published on 16 March 2022.2 This report provides an alarming review of the multiple hazards faced by gray whales in the Pacific: • There have been more than 500 strandings in recent years, and these are believed to be "a fraction of the many thousands that likely died and sank to the ocean floor." • There has been a 24% decline in the number of eastern North Pacific	See Appendix C Responses to Frequent and Substantive Comments #19-Ongoing UME See also Section 3.4, Affected Environment-Gray Whales, and Section 4.4, Environmental Consequences-Gray Whales, of the FEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			whales since 2016 • The number of calves observed has declined significantly. • There are observations of emaciation and speculation that climate change may have adverse impact on the whales' nutrition. And there are multiple other factors that indicate the gray whales of the eastern North Pacific are facing a crisis. Imposing additional mortality at this time would be a gesture of contempt toward the whales and toward the majority of American citizens. Much of this data is also available in the SDEIS. After reviewing the data, the SDEIS concludes (p. 96) "therefore, additional mortality resulting from the hunt would not have a discernable impact on the stock's abundance." Dismissing hunt mortality in this manner is unscientific and tendentious. Each fatality that can be counted is indeed "discernable" – that's why scientists like to keep accurate numbers. It is important to keep in mind that gray whales are subject to a variety of fatalities, from entanglement and ship collisions to strandings, climate change and toxic spills. They all must be counted to achieve appreciation of factors impacting abundance. Hunting is different only in the fact that it is intentional and easily preventable. --- 2 Available from https://www.cnn.com/interactive/2022/03/climate/gray-whale-pacific-arctic-climate-change/.	
			Friends of Animals is disappointed with the mind-set behind section 4.12 "Aesthetics" of the SDEIS. Where the no-hunting alternative is seen to "have adverse aesthetic effects on interested observers who desire to view a hunt." (p. 88) Any NOAA employee who holds there is legitimate aesthetic appreciation to viewing the intentional killing of whales with	Comment noted.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			primitive weapons is absolutely out-of-touch with contemporary American values. This type of thinking is vulgar.	
			Moreover, the SDEIS fails to consider the growing body of evidence demonstrating the complex social structures and cultures in whale populations, as well as variations among individuals. 3 This information is critical to understanding the impacts of a whale hunt. Section 4.4.1 of the SDEIS employs five criteria to determine the potential effects of the proposal on the gray whales. The first four criteria address quantifiable matters such as abundance and viability of populations. The fifth criteria involves "welfare of individual whales." The fifth criteria is not addressed because "the method of approaching, striking and killing whales has not changed, nor have the related estimates of time to death and hunting efficiency." This is not the hard look required by NEPA. Not only does it sidestep an issue that is of very significant importance, particularly to Americans who have interest in whale conservation and welfare, it also ignores the intrinsic value of each whale and their importance to the conservation of the species. The SDEIS ignores the individual variation and sociality of whales, which are important considerations for conserving marine mammal populations.4 Given the complex social interactions and cultures of marine mammals, "removals can have a greater impact on social and population dynamics than predicted by models in which individuals are assumed identical and interchangeable."5 Human hunts can destroy social bonds and fragment important social groups. This can have lasting impacts on individuals and entire populations, especially given the myriad of other threats that gray whales are currently facing including ship strikes, entanglement and by-catch, underwater noise, pollution, and habitat loss. --- 3 See Brakes, P., Rendell, L. (2022). Conservation Relevance of	Subsection 4.4.1, Gray Whales-Introduction, of the FEIS evaluates the potential for the alternatives to affect gray whales on a range of scales from individual animals to the stock. The 5th criteria is analyzed in the 2015 DEIS, and the analysis in DEIS applies, as noted in 4.4.1, to the alternatives in the SDEIS. We have considered the references provided, and it does not provide additional information on gray whales which would inform the decision.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Individuals and Societies. In: Notarbartolo di Sciara, G., Würsig, B. (eds) Marine Mammals: the Evolving Human Factor. Ethology and Behavioral Ecology of Marine Mammals. Springer, Cham. https://doi.org/10.1007/978-3-030-98100-6_3; Garland, E. C., & Carroll, E. L. (2022). Culture and Social Learning in Baleen Whales. InEthology and Behavioral Ecology of Mysticetes(pp. 177-191). Springer, Cham. 4 Brakes, supra note 3. 5 Id. at 104.	
			Page 89 of the SDEIS makes reference to "protests and ensuing law enforcement responses" linked to any whale hunting. Why would NOAA endorse whale killings that it anticipates would provoke such protests?	The FEIS is an analysis, not endorsement, of' alternatives to inform decision-making.
			Friends of Animals is further disappointed by the omission of reference to certain reports of poaching and cruelty. For example, in neither the SDEIS nor in the DEIS do we find reference to the newspaper report "2 Makahs get jail time for killing whale" (by Lynda V. Mapes, Environmental Reporter for Seattle Times, June 30, 2008). This article reports a poaching incident involving five Makah tribe members. That report says, in part: "In September, the five men killed a gray whale in the Strait of Juan de Fuca, shooting it at least 16 times and sinking at least four harpoons into its flesh. The animal bled for some 12 hours before dying and sinking to the bottom." The duration of agony described in this report appears to be at odds as to the rapid deaths promised by the "experts." Friends of Animals is skeptical about there being even a modicum of concern about the suffering of gray whales should this proposal be accepted. FoA has seen such evasiveness before.	This incident is included in Subsection 1.4.2 of the DEIS and is included in the FEIS. See Appendix C Responses to Frequent and Substantive Comments #1-Potential for a hunt to cause pain or suffering to whales.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Friends of Animals has had numerous involvements on issues concerning the conservation and management of marine mammals. One of the most enlightening was the campaign to stop the U.S. commercial hunt of Northern fur seals (Callorhinus ursinus). Prior to 1979, FoA had relied upon U.S. Government reports, mostly from the Department of Commerce, that assured citizens that the seals were being managed in a conservation-sensitive and sustainable manner, and the government-administered hunts were conducted humanely. In 1979, FoA sent a team to the Pribilof Islands of Alaska to document the conservation-sensitive, sustainable and humane seal "harvest." FoA witnessed and documented a bloodbath. U.S. Government contractors herded "pods" of several dozen adolescent male seals inland, using metal noise makers, shouting and aggressive gestures. The pace was intense for the seals and they soon demonstrated evidence of exhaustion. Thus weakened, the government contractors surrounded the seals and then bludgeoned them with long wooden poles. The fortunate ones received a sharp blow to the skull which rendered them unconscious. But many were not so fortunate. Blows fell on their spines, shoulders, flippers and faces. Most required repeated blows to knock them out. Unconscious and semi-conscious adolescent seals were then rolled on to their backs and stabbed in the chest. This was soon followed by teams of workers who cut a series of incisions into the seals' bodies, facilitating the tearing of the pelt from the carcass. There was no effort to assure the seals were truly dead when their pelts were ripped from them. Multiple thousands of seals were killed in this horrifying manner. Friends of Animals then campaigned vigorously to have the commercial killing of Northern fur seals stopped. These efforts were rewarded five years later when, in 1984, the U.S. Government discontinued the killing. Four years later, in 1988, the U.S. declared the Northern fur seal "Depleted" within the context of the Marine Mammal Protection Act. That designation remains valid today. The Northern fur seal is also listed as "vulnerable"	Comment noted.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			under the Endangered Species Act. Friends of Animals is unaware of any agency or persons having been held accountable for imposing outrageous cruelties upon the seals. Nor has there been acknowledgement that the mismanagement of the population led to its depletion status. In retrospect, it is clear that U.S. Government apologists for the seal hunt were less than candid when they insisted that the management policies were conservation-sensitive, sustainable and humane.FoA hopes the hard lessons of 1979 no longer apply. But, upon study of the provisions of the 1855 Treaty, and reading the SDEIS, with all of its qualified language, emphasis on data (much of which seems inconsequential) and dearth of information concerning what cruelties would be borne by the whales.	
			It is the opinion of Friends of Animals that the SDEIS is scientifically weak and does not constitute a persuasive basis for granting the Makah request to hunt whales. Friends of Animals is also of the opinion that the 1855 Treaty of Neah Bay binds the rights of the Makah with those of all U.S. citizens on matters involving whale hunting, with no provision for granting any separate waivers. Consequently, the Makah request should be denied.	We disagree tha the SDEIS is scientifically weak. See Appendix C Responses to requent and Substatinve Comments #8-Treaty of Neah Bay.
479	Lewis, Sammarye	8/23/22	I write to the imminently oppose Makah request to slaughter whales. This is 2022, not 1822, and there is no valid reason to hunt these sentient beings. Just because a group might have the right to brutally kill whales, does not make it the right thing to do. It is morally and ethically wrong to kill these whales. The subsistence excuse is no longer valid in 2022. When you have a McDonald's on the corner, and supermarkets to provide food it belies the subsistence excuse. To claim culture and tradition for brutal killing, using speed boats and high caliber automatic weapons, is a farce. There is no culture nor tradition using modern weaponry. Cannibalism was once culture and tradition, until awareness and morality put a stop to it. Food source? If money is available to buy expensive boats and weapons,	See Appendix C Responses to Frequent and Substantive Comment #1 -Potential for a hunt to cause pain or suffering to whales and #3-Makah Tribe's desire to revive its whaling tradition.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			then money is available to buy food. It brings this request to brutally and cruelly slaughter whales down to what it really is: thrill killing.	
480	Burdet, Kevin	10/6/22	The Makah Tribe is more tuned to its environmental impact as a people with its unique culture than the United States and NEPA. The EIS was developed for US agencies because our federal government, and most of our institutions, are focused on commerce, which often clashes with maintaining the natural environment, as well as culture, and unfortunately, human well-being. Allowing the Makah Tribe to hunt whales as they have traditionally, would bring reconciliation after gray whales, an integral part of their identity, have thankfully returned to natural carrying capacity once laws stopped non-indigenous societies from whaling them to extinction. As a sovereign entity with Treaty Rights, the Makah Tribe should not have had to wait so long to return to their traditional practices that they eagerly wish to reclaim. I am an environmentalist, and when I hope for the future of the natural world around us, there is no better approach than the one that existed and preserved it for thousands of years: the indigenous-led approach. Although I am not an expert, I do believe that the significance of allowing the Makah Tribe to return to their traditional practices will be far more significant than any impact on the environment. Please consider that there is great benefit beyond other alternatives that do not allow for the Makah Tribe to hunt gray whales. Thank you.	Comment noted.
481	AWI	10/7/22	On behalf the undersigned organizations, the Animal Welfare Institute (AWI) respectfully requests a second, limited extension (as detailed below) in the deadline for public comments on the Draft Supplemental Draft Environmental Impact Statement on the Makah Tribe's Request to Hunt Gray Whales (DSEIS). 87 Fed. Reg. 39,804 (July 5, 2022). If granted, the new deadline for comments would be October 31, 2022.AWI notes, with appreciation, the decision by the National Oceanic and Atmospheric Administration/National Marine Fisheries Service to extend the original	See Subsection 1.5.3 for a summary of the public comment process, including extensions granted, on the DEIS and SDEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			deadline by 60 days until October 14, 2022. 87 Fed. Reg. 50,319 (Aug. 16, 2022). Despite this extension, as a result of new information obtained by AWI, and concerns about the accuracy of information contained in a recently published report (Harris et al. 2022), it is imperative for the benefit of all interested stakeholders that NOAA/NMFS provide an additional, abbreviated extension to the comment period. This extension, if approved by NOAA/NMFS, would provide additional time to ensure that all substantive information relevant to the analysis contained in the DSEIS and the decision to be made, is available to the public and that there is sufficient time for stakeholders to review and analyze the documents and tomincorporate their findings into informed comment letters.1. Additional time is warranted to permit careful review of Harris et al. (2002) before the end of the comment period In its previous request for an extension (dated July 22, 2022) (attached), AWI raised concerns the unavailability of a report, Harris et al. that is repeatedly cited in the DSEIS but which, at the time the DSEIS was published was "in prep." On September 27, NOAA/NMFS finally made available an electronic version of this report,1 and on September 29, emailed some stakeholders notifying them of the report's availability. Regrettably, in doing so, NMFS has allowed the public approximately only two weeks to review and analyze the content of this report before current comment deadline. Such a limited timeframe is insufficient to ensure that interested stakeholders can properly review and assess the information for incorporation into substantive comments.2. New reports on gray whale population abundance estimates and estimated gray whale calf production are currently unavailable and warrant public review during this comment period because they are directly applicable to the analysis contained in the DSEIS. It has also come to the AWI's attention that two additional reports, directly applicable to the analysis contained in the DSEIS, are pending publication. These reports include a new gray whale population abundance estimate based on 2022 southbound migration	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			counts from Granite Canyon in California as well as a new report on estimated gray whale calf productions based on survey data collected from Piedras Blancas, also in California. Both of these surveys were referenced in the 2022 report of the Scientific Committee of the International Whaling Commission. 2 AWI was initially informed on 10 August 2022 that these reports would be published "at any moment"3 and subsequently was told by a NMFS scientist on 24 September that the reports should "be out in a week or two."4 Noting that the DSEIS was published, in part, to provide analysis of: a) the ongoing gray whale Unusual Mortality Event; b) the approximately 24 percent decline in the number of gray whales between 2016 and 2020; and c) the inclusion of minimum abundance thresholds in the DSEIS, having access to these two new NMFS reports prior to the end of the comment period is crucial so that this information can be incorporated into informed and substantive comments. This information is not peripheral to the analysis but, rather, is directly relevant to the assessment of environmental impacts and the decision to be made at the conclusion of this decision-making process. As the National Environmental Policy Act requires agencies to base their analyses on high quality scientific information and to fully disclose such information, it is critical that these two reports be published before the current comment period on the DSEIS closes.3. Details of Extension RequestFor the foregoing reasons, AWI requests a minimal 17-day extension in the comment deadline until October 31, 2022. As part of this request, AWI asks NOAA/NMFS to ensure that it expedite completion of both the new gray whale population abundance estimate and calf recruitment reports so that they are published by no later than October 20, 2022. Should these reports not be published by October 20, 2022, AWI respectfully requests that NMFS again revise the comment period to allow for a minimum of 17 days for public review following their publication date. Should the publication dates for each report differ, we request that NMFS base the	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			deadline extension on the latest publication date. Extending the comment deadline and ensuring that all relevant information is available for review and analysis will benefit all stakeholders interested in the DSEIS regardless of their perspective on whaling by the Makah tribe.Thank you in advance for considering this request. Should you have any questions about this request and/or to inform AWI of the decision made by NMFS in response to this request, please contact DJ Schubert at dj@awionline.org. 1 Harris, J., J. 			States); The Whaleman Foundation (United States)"Attachment: July 22 Request for extension	
482	Makah Indian Tribe	10/13/22	The Makah lndian Tribe (Makah or Tribe) submits the following comments on the Supplemental Draft Environmental Impact Statement (SDEIS) prepared by the National Marine Fisheries Service (NMFS) as part of the agency's ongoing review of the Tribe's 2005 request for a waiver of the Marine Mammal Protection Act (MMP A) to conduct ceremonial and subsistence hunts of Eastern North Pacific (ENP) gray whales pursuant to Makah's express treaty whaling right under the 1855 Treaty of Neah Bay. The Tribe appreciates that the SDEIS was released for comment within the timeframe outlined by NMFS in December 202 1 and, notwithstanding the 60-day extension of the public comment period, looks forward to the ultimate decision on the waiver by the NMFS Assistant Administrator in early 2023. A decision in February 2023 would be 18 years after the Tribe submitted its request, during which time a generation of Makahs has effectively been denied the ability to exercise the right secured by the Treaty and deprived of the many benefits for the Makah people that the Treaty was intended to protect. The Tribe’s comments are organized into two parts. First, we provide general comments that, in some situations, are accompanied by specific recommendations on new or modified text that would more accurately reflect the underlying data or clarify NMFS’ explanations and analysis. In the second part we provide technical and line edit corrections where we identified errors in the SDEIS. Finally, we attach the November 13, 2021, Comments of the Makah Tribe on the Administrative Law Judge’s (ALJ) Recommended Decision (ALJ Decision Comments) for reference because	We note the background and introductory information.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			we incorporate parts of those comments in the Tribe's comments on the SDEIS.	
			General CommentsPages 6-12 (2.1 Alternative 7 (Composite Alternative – Preferred). The summary of key provisions of the Preferred Alternative indicates that this alternative was developed, in part, based on elements of the recommended decision of ALJ George J. Jordan. However, the SDEIS does not specifically identify how this alternative is different from NMFS' proposed waiver that was the subject of the November 2019 ALJ hearing. We recommend that NMFS include in Chapter 2.1 a summary of substantive changes to the proposed waiver reflected in the Preferred Alternative. This would improve the transparency of the SDEIS for the public and agency decisionmakers and achieve one of the purposes for preparing the document, namely "to address the ALJ's recommended decision and corresponding public comments." SDEIS at iii (Executive Summary).	The Preferred Alternative is described in Subsection 2.3.7 of the FEIS and includes measures from ALJ Jordan's recommended decision, such as a low abundance threshold for ENP gray whales and a requirement that the Makah Tribe obtain incidental take authorization for WNP gray whales during any winter hunt. These are the most significant changes from the regulations NMFS proposed in 2019, and they are described in the FEIS.
			Page 9 (2.1.2 Timing of Hunt (Seasonal Restrictions)). Makah emphasizes NMFS' suggestion that the agency "could remove ... language" from the proposed waiver assigning winter-spring hunts to even-numbered years and summer-fall hunts to odd-numbered years. The Tribe welcomes this suggestion as a means to increase flexibility in implementing a final waiver decision and avoid further delays in the Tribe's exercise of its treaty whaling right. Further, Makah agrees with NMFS' observation that the assignment of alternating hunt seasons to even or odd years is not based on conservation, and further notes that it is not a requirement of the MMPA.	We note the Makah's support of the winter-spring and summer-fall hunt language.
			Page 11 (2.1.8 Age, Sex, and Reproductive Status). The SDEIS incorrectly states that the Tribe's waiver request proposed a prohibition on approaching a calf or a whale accompanied by a calf. See February 11, 2005, Application for a Waiver at 2, 17, 34 (addressing prohibition on striking a calf or whale accompanied by a calf).1The Tribe disagrees with the Preferred Alternative's inclusion of a prohibition on approaching	We have corrected the language in the FEIS on approaching a calf or whale accompanied by a calf. We note the Tribe's disagreement with the prohibition on approaching calves and adults accompanied by a calf.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			calves and adults accompanied by a calf, and we described the reasons for this objection at length in comments on the ALJ's recommended decision. See ALJ Decision Comments (attached) at 7-11. Those comments are incorporated here by reference.----------1 https://media.fisheries.noaa.gov/dam-migration/2005-makah-application.pdf.	
			Page 22 (2nd paragraph - NMFS Stock Assessment Report for ENP Gray Whales). This section describes multiple evaluations of the Makah hunt by the International Whaling Commission (IWC) as reported in NMFS' stock assessment report (SAR) for ENP gray whales. It notes that the IWC reviewed the Makah hunt management plan and "concluded that levels of harvest and other human-caused mortality are sustainable given the population abundance." The Tribe agrees that the proposed hunt plan, as evaluated by the IWC Scientific Committee, is "sustainable," especially given its scope and impacts in relation to the ENP population as a whole. We also support NMFS' reliance on the IWC's scientific review of the hunt, which forms a strong basis for approving the waiver because the IWC's conservation objectives are equivalent to the MMPA's core conservation objective of maintaining (or achieving) a stock's optimum sustainable population (OSP). See ALJ Decision Comments at 3 (citing ALJ's Recommended Decision at 93 n.25); see also SDEIS at 73 (final paragraph) (citing IWC Scientific Committee's conclusion that ENP and PCFG populations would remain "at or above the level resulting in the highest net recruitment").2 However, where the SDEIS refers to the IWC Scientific Committee's evaluation of and conclusions regarding the Makah hunt, we recommend that, in addition to informal descriptors such as "sustainable," NMFS include the Scientific Committee's formal determination that the hunt	We have included the following statement in Subsection 3.17.3.2.2, Aboriginal Subsistence Whaling, of the FEIS. "The SC concluded that the Management Plan met the IWC's conservation objectives for ENP, WNP, and PCFG gray whales."

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			meets the IWC's conservation objectives for ENP, WNP and PCFG gray whales. See SDEIS at, e.g., 5, 12, 40. --- 2 "[T]he [population] level resulting in the highest net recruitment," SDEIS at 73, is equivalent to the "population level that results in maximum net productivity[,]" which is defined as the lower bound of OSP, 50 C.F.R. § 216.3 (definition of OSP); see also 16 U.S.C. § 1362(9) (same). 3 Harris, J., J. Calambokidis, A. Perez, and P. J. Mahoney. 2022.	
			Page 28 (PCFG Seasonal Distribution, Migration, and Movements) and elsewhere. Throughout the SDEIS, NMFS relies on Harris et al. (in prep) for updated information on the abundance and mixing rates of the Pacific Coast Feeding Group (PCFG). This paper was made available to the parties of the ALJ hearing by email and posting to NMFS' website for the Makah hunt on September 28, 2022.3The Tribe expects that NMFS will carefully review the final Harris et al. paper and confirm that all data, analysis, and conclusions cited in the SDEIS are consistent with the final processed report. --- 3 .Harris, J., J. Calambokidis, A. Perez, and P. J. Mahoney. 2022. Recent trends in thendance of seasonal gray whales (Eschrichtius robustus) in the Pacific Northwest, 1996-2020. AFSC Processed Rep. 2022-05, 22 p. Alaska Fish. Sci. Cent., NOAA, Natl. Mar. Fish. Serv., 7600 Sand Point Way NE, Seattle WA 98115.	We reviewed Harris et al. (2022). The data, analysis, and conclusions in the SDEIS and FEIS are consistent with the final processed report.
			Page 40 (final paragraph - 3.3 National and International Regulatory Environment). We recommend that, in addition to describing the IWC Scientific Committee's review of the Makah hunt plan in 2018 and the Aboriginal Subsistence Whaling (ASW) Sub-Committee's review and endorsement of the Scientific Committee's report and recommendations, the SDEIS add that the IWC "endorsed the results, conclusions and recommendations of the ASW Sub-committee and the [Scientific	We have included the following statement in Subsection 3.17.3.2.2, Aboriginal Subsistence Whaling, of the FEIS. "The SC concluded that the Management Plan met the IWC's conservation objectives for ENP, WNP, and PCFG gray whales."

			Committee].” Chair’s Report of the 67th Meeting (IWC 2018) at 12-13 (Section 8.2, Aboriginal Subsistence Whaling Management Procedure (AWMP)).4 --- 4 https://archive.iwc.int/pages/view.php?ref=7592&k=	
			Page 47 (2nd paragraph - Potential Number of ENP Whales Killed and Harvested), page 49 (Table 4-3), and several other locations.5 The summary text provides the average and maximum harvest numbers, then states that “this equates to 0.0002% of the ENP gray whale population.” The clarity of this sentence could be improved in multiple ways. First, it is unclear whether “this” refers to the average or maximum annual number of harvestable whales in the preceding sentence.Second, we strongly recommend that percentages – especially the very small ones calculated for the probability of taking whales – be reported to two significant digits. Here, for example, an average of 4 whales per year out of a population of 20,580 is equal to 0.019% (not 0.0002% as the SDEIS reports) after rounding to two significant digits.6 Describing the percentage as 0.0002% (or even 0.02%) likely obscures the effect of rounding to a single digit. A particularly notable instance of rounding that obscures the underlying data occurs at pages 72-73 where the text (page 72, final paragraph) reports different rounded percentages for two calculations, while the corresponding table (page 73, Table 4-12) shows very similar percentages when two significant digits are used. It would also improve clarity to include an explanation in the text of the figures used for the calculation, e.g., a parenthetical could be added to Page 47 (2nd paragraph) along the lines of “(4 whales out of a population of 20,580 equals 0.019%)”.As with the summary text that reports a single digit, some of the tables also report important information to a single digit, they but do so inconsistently. We recommend that all calculation results – especially those regarding numbers of strikes – be reported to two significant digits. For example,	We have clarified the summary text in the FEIS.We have updated the FEIS to report to two significant digits, where appropriate. We note Makah's agreement with the conclusions described in the comment.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Table 4-3 (page 49), reports the annual number of WNP strikes as "0.04," rather than 0.035. The latter, more precise figure should be used, consistent with the use of two significant digits across the WNP row (and all other rows in the table).7 Indeed, the corresponding cell in Table 4-8 (page 57) does include two significant digits for the estimated annual number of strikes on WNP whales under Alternative 5 ("0.025").Makah agrees with the conclusion of the paragraph on page 47 indicated above that the level of ENP mortality under the alternative in question "would have no discernable effect on the ENP stock's abundance or rate of growth, and no effect on the stock's abundance relative to OSP." The Tribe similarly agrees with the same conclusion reached by NMFS for the five remaining action alternatives, including the Preferred Alternative. See SDEIS at 48, 50, 53, 55, 58, 63, 66.The Tribe also agrees with similar conclusions regarding the impact of the Preferred Alternative on WNP and PCFG whales. See page 74 (1st paragraph: "Alternative 7 and its sub-alternatives are not expected to have a detectable impact on the abundance or viability of WNP whales"); (2nd paragraph: "it is unlikely that the death of one to two whales per year would result in a detectable decrease in the abundance of the PCFG").	
			---------- 5.The following citations implicate one or more of the concerns expressed in this comment: page 49 (final paragraph); page 53 (2nd paragraph), page 55 (2nd paragraph); page 58 (2nd paragraph); page 59 (2nd paragraph); page 6 (Table 4-10); page 63 (1st paragraph – two items); page 66 (Table 4-11 – four items); page 72 (final paragraph – three items); page 96 (final paragraph). 6. Makah acknowledges the new ENP gray whale abundance estimate reported in Eguchi et al. (2022) and, as with Harris et al. (2022), expects that NMFS will reflect this new data throughout the SDEIS. For example,	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			4 whales per year out of a population of 16,650 (based on the updated abundance estimate) is equal to 0.024% (0.00024). 7. The following tables include data reported to only one significant digit where two should be presented: Page 60 (Table 4-10); page 66 (Table 4-11 – four items).	
			Page 48 (1st paragraph) and page 49 (Table 4-3 (PCFG % estimate and footnote e)); see also pages 52 (Table 4-5), 57 (Table 4-8), 60 (Table 4-10), 66 (Table 4-11), 77 (Table 4-13), and text throughout the SDEIS. For some time, the Tribe has been concerned with the calculation of mixing rates for PCFG whales, i.e., the proportion of gray whales encountered during the winter-spring season that are PCFG whales. Those concerns extend to NMFS' use of mixing rates in the SDEIS. The first concern relates to processing of the Cascadia Research Collective (CRC) catalog for PCFG whales in recent years (2016-2020) when not all of the whales photographed in the winter-spring were compared to the CRC catalog. Instead of comprehensive matching, effort was prioritized to identify matches with easily recognized PCFG whales. As a result, the reported mixing rate is biased high, thereby increasing the proportion of PCFG whales for purposes of the calculations in the tables identified above and use for other purposes. Makah appreciates that this concern was recognized by Harris et al. (2022) ("However the data between 2016 and 2020 was selectively processed for PCFG individuals which results in a known bias in the simple aggregate mixing rates during the winter/spring in these later years."). Harris et al. report mixing rate estimates from Calambokidis et al. (2019) and the more recent, selectively processed dataset for comparison. Makah recommends that NMFS report only the unbiased estimates from Calambokidis et al. (2019) in the final SDEIS and use these estimates of mixing rates as the basis for its calculations.The Tribe's second concern relates to the apparent calculation of the mixing rate based on only whales	While the SDEIS used the recent mixing proportions, the FEIS notes that "Although Harris et al. (2022) used the same methods as Calambokidis et al. (2019) to update these mixing proportions with data from 2017 to 2022, these data were selectively processed in a manner which resulted in a known bias. Therefore, Harris et al. (2022) recommend relying on the previous mixing proportions until future reporting is complete." Thus, the FEIS relied on the mixing proportions in Calambokidis et al. (2019) (see Subsection 3.4.3.4.2, PCFG Seasonal Distribution, Migration, and Movements).Calambokidis et al. (2019), like Harris et al. (2022), rely on survey data from March through May to calculate the mixing proportion of PCFG whales in the hunt area during the spring migration season. This method for calculating the mixing ratio used to estimate the likely number of PCFG whales struck, subjected to unsuccessful harpoon attempts, and approached during the winter/spring hunt season is described in Subsection 4.1.2.3, Potential Number of ENP and PCFG whales Killed, of the DEIS and FEIS. This is not a new method introduced by Harris et al. (2022).

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			seen in the spring (March-May), rather than including whales observed in winter (December-February). This change is not warranted because the Preferred Alternative would authorize hunting in some years in the winter, and data regarding whale observations in that season are therefore relevant and should be included in determining the mixing rate for the winter-spring season.	
			The Tribe's third concern relates to the use of whales in the CRC catalog seen only once in the PCFG area in the summer-fall season for comparison with whales seen in the winter-spring season to determine the mixing rate. There are multiple problems with this approach. First, it deviates from the definition of PCFG whales adopted by the IWC and NMFS, which requires a whale to be sighted in the PCFG seasonal range in more than one year. Introducing another (non-IWC, non-NMFS) definition for the PCFG (at least for purposes of calculating mixing rates) seems likely to lead to confusion and potential difficulty in implementation of the waiver. Second, and more significantly, there is no need to apply the more conservative approach for mixing rates in the SDEIS when the hunt has previously been demonstrated to meet the IWC's stringent conservation objectives using the IWC definition for the PCFG to determine mixing rates. The SDEIS explains that "this conservative approach is appropriate as it allows for the possibility that a whale sighted in the spring might later be seen for the second time in the PCFG seasonal range." SDEIS at 49 (Table 4-3, footnote e).8 However, the IWC Scientific Committee's evaluation of the Makah hunt in 2018 used a mixing ratio that was informed by the proportion of PCFG and non-PCFG whales based on the IWC's definition for the PCFG, and concluded that the hunt met the IWC's conservation objectives for the PCFG. NMFS relies on the IWC Scientific Committee's evaluation to support the agency's conclusion that the proposed hunt will ensure that the PCFG remains viable over time. See SDEIS at 75 (1st paragraph). The difference between the proposed approach in the SDEIS	The IWC's review of the hunt management plan included the assumption that any unidentified struck whale in the summer months would count as 1 PCFG whale and 0.5 PCFG females, indicating that the precautionary assumptions incorporated into the accounting of PCFG strikes in the summer hunt years under the Preferred Alternative was considered by the IWC. This also adopts the precautionary approach to accounting for PCFG whales that was included in the Tribe's 2005 request.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			and the approach utilized by the IWC's Scientific Committee is not trivial: approximately half of the gray whales observed in the PCFG range during the June-November feeding season do not meet the definition of a PCFG whale. Over time, the accumulation of non-PCFG whales in the CRC catalog would have a compounding effect on the Tribe's ability to exercise its treaty right without any demonstrable benefit for conservation. Makah appreciates that this concern was recognized by Harris et al. (2022), where the paper reports mixing rate estimates based on comparisons with whales seen at least once in the PCFG range after 1 June and whales observed in two or more years within the PCFG seasonal range. However, continued use of the former estimates is unwarranted for the reasons explained above. Makah recommends that NMFS report in the final SDEIS only the estimates based on comparison with whales meeting the PCFG definition used by NMFS and IWC, i.e., those whales observed in two or more years with the PCFG seasonal range. Likewise, NMFS should only use this estimate for calculations in the final SDEIS. --- 8. NMFS explains its rationale for the more conservative approach in determining the applicable mixing rate in footnote e to Table 4-3 (and other similar tables), as follows: "Percentage estimates are based on the springtime whale analysis by Harris et al. (in prep.) that compares whales seen in the spring to the entire catalog of whales identified in the PCFG range during the summer/fall feeding period (in contrast to the definition we use in this EIS for PCFG whales, which requires a whale to be have been seen in at least 2 years). This results in estimates that are likely higher and therefore more conservative than estimates that would be derived from a comparison with whales observed in at least 2 years. We conclude that this conservative approach is appropriate as it allows for the possibility that a whale sighted in the spring might later be seen for the second time in the	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			PCFG seasonal range." SDEIS at 49 (Table 4-3, footnote e) (emphasis added).	
			Page 48 (2nd paragraph - Likelihood of Striking a WNP Whale). In the ALJ hearing, NMFS presented evidence regarding the likelihood of striking a WNP gray whale in a given year of the hunt under the proposed waiver. For ease of understanding, NMFS also described that probability in terms of the number of years of hunting before a hunt would be likely to result in an individual WNP gray whale being struck by Makah hunters. This type of description is used in in the WNP SAR and in the analysis of the Preferred Alternative (although it cites an incorrect number of years).9 See SDEIS at 64 (2nd paragraph). We recommend that NMFS include a similar, easily understood description of the probability of striking a WNP gray whale under each applicable alternative. For Alternative 2, the additional sentence could read: In other words, we would expect one WNP gray whale to be struck by Makah hunters every 28 years, if the Tribe made the maximum number of strike attempts allowed and if ENP and WNP population sizes and migration patterns remained constant. We recommend that the SDEIS include a "one every X years" description for the likelihood of striking at WNP whale for alternatives 3, 5, and 6. No such description would be necessary for Alternative 4, which limits the hunt to the summer-fall season when WNP whales are not present in the hunt area. --- 9. The 2020 SAR for WNP gray whales, relying on an outdated probability estimate, states in the section on Subsistence/Native Harvest Information: "The proposed rule states 'there is about a 6 percent probability of hunters striking one WNP gray whale over the 10 years of the regulations (Moore and Weller, 2018). This probability is the most likely point estimate; the 95 percent confidence interval ranges from 3.0 percent to 9.3 percent. Stated	Recommendation noted.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			another way, the most likely point estimates indicate that one in 17 10-year hunt periods (i.e., one year out of 170) would result in an individual WNP gray whale being struck by Makah hunters, if the Tribe made the maximum number of strike attempts allowed in even-year hunts and if ENP and WNP population sizes and migration patterns remained constant (Moore and Weller, 2018)'." (https://media.fisheries.noaa.gov/2021-08/2020-Pacific-SARS-Western_Graywhale.pdf)	
			Page 64 (2nd paragraph - Likelihood of Striking a WNP Whale). Based on analysis that "up to 0.015 of those [three] strikes [in a winter-spring hunt] would be on a WNP whale," NMFS "would expect one WNP whale to be struck every 67 years." However, this translation of the probability to a "one every X years" terms is incorrect. The probability applies to the likelihood of striking a WNP whale during 67 years in which a winter-spring hunt takes place (assuming the same hunt limits and stable whale populations). However, the winter-spring hunt would only occur in alternating years, so the true probability under the Preferred Alternative is one WNP gray whale every 134 years, i.e., half the frequency stated. This is consistent with the estimates presented in Table 4-11 (page 66). The estimated number of strikes of a WNP whale over 10 years would be 0.075. Thus, a WNP strike would be expected once over the course of 13.3 10-year periods, i.e., approximately once every 133 years.	We have updated the FEIS with analysis from Moore et al. (2023) which considers the alternating hunt seasons.
			Pages 64-65 (4.1.6.4 Potential Number of Unsuccessful Harpoon Attempts and Approaches). We recommend that the text explain the calculation of the number of unsuccessful harpoon attempts, particularly on WNP whales that appears in Table 4-11 (page 66). Although it is relatively easy to determine that the estimated annual number of unsuccessful harpoon attempts was calculated by multiplying the maximum of 18 attempts in a winter-spring hunt season by the WNP probability of 0.5% (which equals 0.09 as reported in the table), calculations for 6- and 10-year periods are less clear because multi-year periods will include both winter-spring and	Table 4-11 in the SDEIS (Table 4-13 in the FEIS) shows how unsuccessul harpoon attempts are calculated annually, over 6-year periods, and over 10-year periods. For each category of whales (ENP, PCFG, OR-SVI, MUA, and WNP), the winter/spring and summer/fall calcultations are separated for both the number of strikes and the number of harpoon attempts, as there are different limitations for those parameters in those seasons. Therefore, the

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			summer-fall hunt seasons. An explanation, including the limitation on training harpoon throws in the summer-fall hunt season would be beneficial to the public and decisionmakers.	calculations only include 5 years of hunts for each season. We explain that there would only be 5 winter/s[ring hunt years and 5 summer/fall hunt years Subsection 4.1.7.1, Potential Timing of a Hunt and Number of Hunting Days. Because training harpoon throws may only be taken during the hunt season in summer/fall hunt years (Subsection 2.3.7, Alternative 7) the estimated number of unsuccessulf harpoon attempts on WNP gray whales in summer/fall hunt years is zero, as shown in Table 4-11 in the SDEIS and Table 4-13 in the FEIS.
			Page 67 (4.1.6.6 Low Abundance Thresholds), page 10 (2.1.5 ENP Population Abundance Threshold Sub-alternatives) and elsewhere. Makah understands the inclusion of the three "potential thresholds, below which hunting would cease" for purposes of evaluating a range of alternatives and impacts in the SDEIS. As explained in the Tribe's comments on the ALJ's recommended decision, however, an ENP threshold is not necessary to protect the ENP stock. Makah continues to support the Preferred Alternative without such a threshold and incorporates its comments on the recommended decision by reference. See ALJ Decision Comments at 6-7. In those comments, Makah emphasized that an average removal of 2.5 ENP whales per year "represent[s] approximately one-one hundredth of a percent (0.0125%) of the ENP population and less than one percent of NMFS's 2018 PBR calculation of 801 whales, the number that could be removed by human causes without affecting the stock's ability to maintain OSP." Id. at 7. Thus, the core objective of the MMPA – to ensure that a stock maintains or achieves its OSP – would be satisfied without implementation of an abundance threshold simply because the scale of the Makah hunt does not come close to increasing human-caused mortalities	We note the Makah's comments and recommendation.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			above the ENP stock's potential biological removal (PBR). The soundness of NMFS' approach in the Preferred Alternative, i.e., without an ENP abundance threshold, is further supported by analysis in the SDEIS regarding the limited scope and impact of the proposed hunt compared to the abundant ENP population as a whole. See, e.g., SDEIS at 47 (2nd paragraph) ("This level of mortality [under Alternative 2], although higher than under the No-action Alternative, would have no discernable effect on the ENP stock's abundance or rate of growth, and no effect on the stock's abundance relative to OSP."); 69 (4th paragraph) ("The number of whales allowed to be removed [under Alternative 7] represents far less than 1% of the ENP gray whale population. Furthermore, the number of whales potentially removed is substantially smaller than the observed levels of interannual variability in whale abundance within the project area."). As the Tribe stated in its comments on the ALJ's recommended decision, if NMFS determines that an overall ENP abundance threshold is warranted, we recommend a threshold based on the OSP analysis conducted by Punt & Wade (2012), which represents the best scientific evidence available of the ENP population's maximum net productivity level (MNPL), which is the lower bound of OSP. This would correspond to the threshold of 16,000 whales in Sub-alternative 7(b). See ALJ Decision Comments at 6-7.	
			Pages 72-73 (4th paragraph and Table 4-12). Section 4.4.1 analyzes the change in abundance and viability of the ENP stock. As part of the analysis, the SDEIS compares the maximum potential impacts in terms of strikes (i.e., whales killed), unsuccessful harpoon attempts, and approaches over the full 10 years of the proposed waiver to the three abundance estimates of sub-alternatives 7(a) through 7(c). The footnotes to Table 4-12 indicate that the percentages for unsuccessful harpoon attempts and approaches are "precautionary estimates" because they assume the Tribe	We have clarified the footnotes in Table 4-15 in the final FEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			would utilize all available attempts or approaches over the 10-year waiver and that each incident would involve a different whale. See SDEIS at 73 (Table 4-12, footnotes b & c). The same "precautionary estimate" qualifier should be included in footnote a for the percentage of the population subject to a strike. In addition, the text and/or the Table 4-12 footnotes should also explain that the overall approach to this estimate is conservative (and hence precautionary) because it assumes all impacts would occur at a single point in time to a static population, rather than, as required by the Preferred Alternative, spread out over a 10-year period. Thus, the actual impacts would be less concentrated than presented in the analysis. Notwithstanding the Tribe's concern about the absence of an appropriate qualification of the analysis, the Tribe agrees with NMFS' ultimate conclusion, namely that "Alternative 7 and each of its sub-alternatives are unlikely to have a measurable effect on the abundance and viability of the ENP gray whale stock as a whole." SDEIS at 73 (3rd paragraph).	
			Page 74 (1st paragraph – 4.4.2 Change in Abundance and Viability of the WNP Gray Whale Stock) and page 75 (1st paragraph). Please see our comment above about page 22 (2nd paragraph) of the SDEIS, regarding terminology used to describe the IWC Scientific Committee's evaluation of the Makah hunt on ENP, WNP, and PCFG gray whales. Here, the SDEIS describes the conclusion of the IWC's review in terms of the WNP and PCFG populations "remain[ing] viable under the hunt management plan." As with the use of "sustainable" on page 22 to describe the conclusion of the IWC regarding the ENP population, we agree that the hunt plan ensures that the WNP and PCFG populations will remain viable over time, especially given the scope and impacts in relation to the populations as a whole. We also support NMFS' reliance on the IWC's scientific review of the hunt, which forms a strong basis for approving the waiver because the IWC's conservation objectives are equivalent to the	We have updated the FEIS, as appropriate, to include the Scientific Committee's formal declaration.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			MMPA's core conservation objective of maintaining (or achieving) a stock's OSP. See ALJ Decision Comments at 3 (citing ALJ's Recommended Decision at 93 n.25); see also SDEIS at 73 (final paragraph) (citing IWC Scientific Committee's conclusion that the PCFG population would remain "at or above the level resulting in the highest net recruitment").10 However, where the SDEIS refers to the IWC Scientific Committee's evaluation of and conclusions regarding the Makah hunt, we recommend that, in addition to informal descriptors such as "viable," NMFS include the Scientific Committee's formal determination that the hunt meets the IWC's conservation objectives for ENP, WNP and PCFG gray whales. See, e.g., SDEIS at 5, 12, 40. --- 10. "[T]he [population] level resulting in the highest net recruitment," SEIS at 73, is equivalent to the "population level that results in maximum net productivity," which is defined as the lower bound of OSP, 50 C.F.R. § 216.3 (definition of optimum sustainable population); see also 16 U.S.C. § 1362(9).	
			Page 96 (final paragraph – 5.1.2.2 Natural Mortality). In analyzing natural mortality levels and the unusual mortality event (UME) in Section 5.1.2.2, the SDEIS states that "[t]he overall mortality resulting from the hunt under Alternative 7. . . represents a small fraction of the population (0.0001% of the ENP stock)." Please see our comment above about page 47 (2nd paragraph) and page 49 (Table 4-3) of the SDEIS, recommending use of two significant digits and a parenthetical explaining the figures used to calculate the result presented. Here, the reader might perceive "overall mortality" to mean the 10-year maximum total mortality of 25 whales as was discussed at pages 72-73, but the result appears to be calculated from	We have updated the FEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			the average removal of 2.5 whales per year and the most recent abundance of 20,580 (2.5/20,580 = 0.00012 = 0.012%).	
			Technical Comments and Edits Page vi (Glossary description of "Stock"). The glossary states that "stock" is "defined by regulations implementing the [MMPA]." SDEIS at vi (Glossary). However, we are unaware of any definition of the term "stock" in the MMPA's implementing regulations. Instead, the definition of "stock" is provided in the MMPA itself, which should be quoted and cited. 16 U.S.C. § 1362(11).	The glossary has been updated.
			Page vi (Glossary). A definition for "Unsuccessful harpoon attempt" and "Training harpoon throw" should be included in the glossary.	Additions made to glossary.
			Page 7 (Table 2-1). The cell describing hunt timing for the Preferred Alternative should reference the alternating approach to winter-spring and summer-fall hunts. See SDEIS at 9 (§2.1.2), 60 (§ 4.1.6(a)), etc.	The alternating season is captured in this cell which specifies "Only one hunt season may be authorized in a calendar year, however the first month (December) of a winter/spring hunt would fall in the same calendar year as a summer/fall hunt. See FEIS Table 4-1.
			Page 21 (Table 3-1). The upper bound of the 2015/2016 abundance estimate's statistical interval should be 29.830 (not 20,990).	We have updated Table 3-5 in the FEIS.
			Page 28. The cited numbers regarding unique whales in the PCFG seasonal range (annual average of "168 unique whales"; cumulative total of "888 unique whales") are not consistent with Table 3-4 (page 35), perhaps because the table includes observations from 2020. Compare SDEIS page 32 (2nd paragraph) ("904 unique ENP gray whales were seen in the PCFG range" through 2020).	As the commenter notes, the average and total in the table are inclusive of 2020, while the text describes the trends through 2019. The text focuses "newly seen and seen again" numbers. Animals seen for the first time in 2020 won't be identified until the 2021 numbers are available.
			Page 33 (2nd paragraph). The reference to Figure 3-4 (cumulative number of unique whales) should be Figure 3-3 (page 29).	Figure numbers in the FEIS have been updated.
			Page 38 (Table 3-7). There are a number of corrections (or qualifications) needed in this table. While the 2020 SAR indicates the "current population trend" for the ENP and PCFG is increasing, as the table states in the	We have updated Table 3-11 in the FEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			"Recent Trend" row, this is inconsistent with the data presented in Figure 3-2 (page 26) and Table 3-3 (page 31), which show a recent decrease in abundance as of 2020. If NMFS decides to continue relying on the 2020 SAR for Table 3-7, a footnote for these cells should be provided to the more recent abundance estimates elsewhere in the SDEIS. The informational potential biological removal (PBR) for the PCFG should be consistent with the calculation in Harris et al. (in prep) reported at page 29: 3.1 whales per year. The final row in the table which sums up the human-caused mortality and serious injury for the ENP and PCFG needs to be updated to reflect the information in the 2020 SAR. See pages 54 (Table 4-6 (human-caused mortality (HCM) of 1.7 for the PCFG)); 25 (Table 3-2 (HCM of 130.1 for the ENP)).	
			Page 39 (3rd paragraph). The stranding total as of June 3, 2022, is 578, not 678 as reported in the text. See Table 3-8.	The stranding data has been updated throughout the FEIS.
			Page 40 (final paragraph). The rangewide review of gray whales by the IWC Scientific Committee is referenced, but this occurred over a five-year period (2014-2018), rather than in 2012 as stated in the SDEIS.	We have updated Subsection 3.17.3.2.2, Aboriginal Subsistence Whaling, in the FEIS.
			Page 47 (2nd paragraph); Page 96 (final paragraph). We noticed that in some situations where a percentage of the ENP population was reported (especially in text), the raw number incorrectly included a "%" symbol without adjusting the decimal point to reflect the percentage form. On page 47, for example, 0.0002% is reported, but 4 divided by 20,580 equals 0.0002 if rounded, which is equivalent in percentage terms to 0.02%. As we noted above, a minimum of two significant digits should be reported for all results. See also pages 49, 53, 55, and 63.	We have updated the FEIS with the new abundance estimates and reviewed our results to ensure they are correct throughout.
			Page 60 (final paragraph). The first sentence should be redrafted. Our understanding is that the Preferred Alternative and the SDEIS evaluate the hunt with and without ENP abundance thresholds, but that the PCFG threshold from the proposed waiver is maintained in the Preferred Alternative.	We have updated FEIS Subsection 4.1.7,Alternative 7, Composite Alternative—Preferred, in the FEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Page 82 (3rd paragraph). “trate” should be “treaty”.	This spelling error has been corrected.
			Page 87 (4th paragraph). The first sentence, ending with “compared,” is incomplete.	We have updated Subsection 4.11.3.7, Alternative 7, Composite alternative – Preferred, in the FEIS.
			Attachment: Comments of the Makah Indian Tribe on the ALJ's Recommended Decision Issued on September 23, 2021 in In re: Proposed Waiver and Regulations Governing the Taking of Eastern North Pacific Grey Whales by the Makah Tribe, Docket No. 19-NMFS-0001 November 13, 2021	Attachment noted.
483	Baur, Don	10/14/22	I am submitting these comments on the Supplemental Draft Environmental Impact Statement on the Makah Tribe Request to Hunt Gray Whales (SDEIS), noticed in the Federal Register on July 5, 2022.1 I am submitting these comments on my own behalf, as an attorney with background and experience on the Marine Mammal Protection Act (MMPA). These comments follow up on my previous letters of March 12, 2020, March 16, 2020, and November 15, 2021, which are incorporated by reference. As was the case for my previous letters, in submitting these comments, I do not take a position for or against the Makah hunt. The purpose of these comments is to address the legal issues associated with the Makah waiver request and the way it has been processed by the National Oceanic and Atmospheric Administration /National Marine Fisheries Service (NMFS). As discussed in all my comment letters, NMFS has thus far followed an approach for consideration of the waiver that is at odds with MMPA’s purposes and policies, statutory requirements, and case law precedent. For the reasons discussed in this letter, the SDEIS further highlights the deficiencies in the waiver process to date. To comply with the MMPA, the National Environmental Policy Act (NEPA), and the Coastal Zone Management Act (CZMA), NMFS must take the actions described in this letter.	We note this background and introductory information.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			---------- 1. 87 Fed. Reg. 39,804. Comment Period extended on August 16, 2022 (87 Fed. Reg. 50,319).	
			NMFS Must Provide an Opportunity for an On-the-Record Hearing to Consider the Information in the SDEIS. As discussed in my previous letters, the MMPA waiver regulations in 50 C.F.R. § 228.4(b)(6) and § 228.16(b) require that the record considered at a hearing must include the DEIS on the proposed action, in this case, the Makah hunt. My previous comments provide the full rationale and importance of this requirement.Now that it has been released, the SDEIS confirms the need to provide a renewed opportunity for a hearing on an *updated and revised record.* The SDEIS is, quite simply, a DEIS, and as such, falls within the plain meaning of the requirements of sections 228.4(b)(6) and 228.16(b).The SDEIS itself confirms that it is not some kind of a new or different document that does not fall within the term "draft EIS" (e.g., it cannot be argued that an SDEIS is somehow different than a DEIS). As described in the Abstract on the initial page of the SDEIS, the SDEIS is a "Supplement to the 2015 DEIS." Thus, NMFS concedes that the SDEIS is an addition to and part of the 2015 DEIS. As such, it is within the terms of sections 228.4(b)(6) and 228.16(b). The full DEIS that would serve as the basis for NMFS action on the waiver request now includes the SDEIS; without it, the 2015 DEIS is incomplete, and the record developed at the hearing, upon which the Administrative Law Judge (ALJ) based his recommended decision (RD), is also incomplete.The SDEIS also confirms that the 2015 DEIS is stale and out of date. Guidance from the Council on Environmental Quality (CEQ) establishes that a NEPA document that is more than five years old must be reviewed for sufficiency before it can be the basis for agency action.2 Obviously, NMFS itself has determined that the 2015 DEIS is not an adequate basis for a decision on the waiver request because it has prepared the SDEIS, and for good reason because there is so	We note the legal arguments contained herein. However, the purpose of the FEIS is to provide information, not resolve legal dispute or determine the next steps in the waiver proceeding. With respect to the information being stale, we have reviewed the information in the DEIS and SDEIS and updated the information, where appropriate.The new alternative in the SDEIS is based on the proposed waiver and regulations (84 FR 13604, April 5, 2019), which was considered in the hearing before the ALJ, and Judge Jordan's recommended decision. It is a composite elements from the other six alternatives previously considered in the 2015 DEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			much new information on key environmental factors associated with the Makah hunt over the last seven years. By taking the appropriate and commendable action of preparing the SDEIS, NMFS concedes that the hearing record is incomplete and insufficient.	
			Finally, the requirement for a renewed hearing opportunity is demonstrated by the fact in that several of the key issues that were the focus of the hearing are addressed with new information in the SDEIS. These issues include: impacts on Eastern North Pacific gray whales (ENP), Pacific Coast Feed Group (PCFG) gray whales, and Western North Pacific gray whales (WNP); the ongoing Unusual Mortality Event (UME); PCFG stock identification issues such as range, abundance, recruitment, genetics, mixing proportions of PCFG and ENP whales, and migratory and feeding behaviors; WNP, ENP, and PCFG abundance estimates; optimum sustainable population (OSP) calculations; and the significant degree of uncertainty that exists regarding the stock structure hypotheses related to WNP and PCFG whales. Indeed, the SDEIS even includes a new alternative, the so-called Composite Alternative (SDEI at 6-12), which has been designated by NMFS as the preferred alternative. Because alternatives are the heart of the NEPA process,3 the sufficiency, fairness, and objectivity of the hearing process will be severely compromised if the parties do not have the opportunity to adjudicate the very course of action that NMFS has now identified as its desired outcome. The hearing before a trier of fact is the distinguishing feature of a waiver proceeding. It provides a rigorous method to examine the evidence and the analyses relied upon by the applicant (the Tribe), to meet its heavy burden of proof under the MMPA and upon which NMFS must make its findings to ensure the law's purposes and policies are met. Such an important procedural step should not be given short shrift under NEPA, by excluding from consideration in the hearing the most recent information available in	See response above.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			the form of a supplement to the outdated DEIS that existed at the time of the hearing, including the agency's own preferred alternative. Although a DEIS does not have to include a preferred alternative, there is a strong need to do so in a waiver proceeding where the burden of proof attaches to the action that is the subject of the waiver application. Without knowing what action NMFS is proposing to take, the evidence supporting that alternative cannot be fully authorized through the hearing format. The failure to allow for such a rigorous procedure is especially egregious in a case such as this where the preferred alternative was not presented at all. There is an easy solution to this problem. NMFS should provide the parties to the waiver proceeding an opportunity for an on-the-record hearing on the information contained in the SDEIS. Such a hearing, if requested, could be limited in scope, and it almost certainly could be conducted within the time that will still be necessary to complete the NEPA and CZMA (see below) procedures that NMFS must yet undertake to reach a decision on the waiver request. It is even possible that no party will seek a further hearing.	
			Failure to offer such an opportunity will be a fatal legal defect that, in the event of a lawsuit, is almost certain to result in a court invalidating the final decision on procedural grounds alone with a remand requiring a new hearing after the SDEIS has been included in the record. After decades of review and litigation, the Makah waiver process does not deserve the further delay and legal risk caused by a decision by NMFS to deny the parties the opportunity to consider the SDEIS in a hearing before an ALJ. If it is the case that NMFS would need to enter into a new agreement or contract with another agency to secure the services of an ALJ, the resulting inconvenience and cost would be minor compared to the complications,	See response above.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			delay and legal machinations that would result from a court ordered remand due to failure to include the SDEIS in the hearing record. --- 2. CEQ, Forty Most Asked Questions Concerning CEQ's National Environmental Policy Act Regulations, 46 Fed.Reg. 18026, Question 32 (Mar. 23, 1981, as amended 1986). 3. 40 C.F.R. § 1502.14; NRDC v. Hodel, 865 F. 2d 288, 294-96 (D.C. Cir. 1988).	
			The SDEIS Fails to Give Proper Consideration to the Status of the PCFG, and NMFS Has Not Taken the Steps Necessary to Grant a Waiver to Hunt These Whales The consideration of the effects of the Makah hunt on the PCFG in the SDEIS continues along on the same legally impermissible trajectory as was true for the NMFS testimony and arguments at the hearing and in the ALJ's RD. The SDEIS also fails to consider the best currently available scientific information on the PCFG stock issues. <u>The MMPA and the PCFG.</u> My previous letters describe the fundamental flaws with the NMFS and RD analyses and findings for determining the effects of the hunt on the PCFG. In summary, the MMPA has as its primary objective to maintain the health and stability of the marine ecosystem and, whenever consistent with that goal, to obtain an OSPof marine mammals.4 Further, it is an objective of the MMPA to prevent population stocks from diminishing beyond the point at which they cease to be a significant functioning element of the ecosystem of which they are part and, consistent with that objective, that they should not be permitted to fall below their OSP.5 The MMPA also finds that there is inadequate knowledge of the ecology	We note the legal arguments contained herein, but the purpose of the FEIS is to provide information, not resolve legal disputes. Regarding the status of the PCFG, see Appendix C Responses to Frequent and Substantive Comments #5-Stock status of the Pacific Coast Feeding Group (PCFG) of ENP gray whales.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			and population dynamics of marine mammals and the factors bearing upon their ability to reproduce successfully and that immediate action should be taken internationally to encourage the conservation of marine mammals.6 To issue a waiver, the Secretary must issue determinations that the requested take is compatible with the MMPA as set forth in the objectives, purposes, and policies described above. In addition, the waiver must satisfy the requirements of sections 102, 103, and 104 to allow the taking. Those determinations must be made based on sound principles of resource protection "as provided in the purposes and policies" of the MMPA cited above.7 Relying on the intent of Congress as expressed in the legislative history, the courts have consistently interpreted these provisions of the MMPA to establish a conservative bias in favor of marine mammals and to place a heavy burden of proof on any party seeking to take marine mammals.8 To grant a waiver, NMFS, in consultation with the Marine Mammal Commission (MMC), must comply with section 103 and prescribe regulations to ensure that the taking "will not be to the disadvantage of the population stocks" and "will be consistent with the purposes and policies" of the MMPA set forth above.9 The disadvantage test has been construed by the courts to mean a population stock cannot be allowed to fall below its OSP and that no take should be allowed from a stock that is already below OSP.10 The section 103 regulations are to be developed "on the record after opportunity for an agency hearing" on the required waiver determinations regarding the MMPA purposes and policies.11 Such regulations must be accompanied by statements of estimated existing levels of the populations stock, the expected impact of the taking on OSP of the stock, a statement	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			of the evidence upon which the regulations will be based, and any studies by or for NMFS or recommendations from the MMC relating to the taking to be allowed under the waiver.12 To satisfy these requirements, NMFS must first determine whether the PCFG is a population stock. After doing so, it must determine whether that stock is within its OSP range. Having made those findings, NMFS must then determine what effects the take occurring under the waiver would have on the stock. If the stock is below OSP, no take can be allowed because it would be to the disadvantage of that population. If the stock is above OSP, the take must not cause the stock to fall below OSP for the same reason. These findings must be made with the conservative bias of the MMPA in mind, and the burden is on the applicant, in this case, the Tribe, to establish the evidence that meets these tests. In cases of uncertainty, the benefit of the doubt must be given to the protection of the marine mammals. For the PCFG, these principles and requirements have largely been left behind. On stock discreteness, NMFS acknowledges the uncertainty of the evidence, but concludes that "the PCFG is not considered a stock under the MMPA." SDEIS at 29.13 Indeed, NMFS notes that a workshop held 10 years ago determined that "there remains a substantial level of uncertainty in the strength of the lines of evidence supporting demographic independence of the PCFG and that the group might warrant consideration as a distinct stock in the future."14 The fact that NMFS acknowledges the uncertainty with the stock discreteness issue means that it should err on the side of the PCFG and separate stock status. At the very least, NMFS should admit that a determination of stock discreteness cannot be made, in which case the MMPA purposes and policies cannot be satisfied, and the disadvantage test cannot be satisfied. Whether due to lack of required	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			information or uncertainty, the impact is the same—the waiver cannot be granted without further steps to comply with the MMPA for the PCFG.15 The Failure of NMFS to Provide Evidence that Supports a waiver. In addition to jettisoning the conservative bias of the MMPA in reaching a stock discreteness determination, NMFS is relying on a flawed analysis of the evidence and has even failed to consider the most recent ongoing studies and developments that support stock discreteness. These flaws in reasoning and analyses derive, to a large degree, from the record developed by NMFS leading up to the SDEIS, as summarized below. It is beyond the scope of the SDEIS comment letter to comment in detail on the technical and scientific issues presented by the NMFS testimony, briefs, and the RD on the PCFG population stock issue. That is the job of the hearing process. However, it is apparent that the SDEIS inherits some of the deficiencies of the underlying NMFS/ALJ analyses presented in those contexts. The problematic nature of these agency arguments and findings have been compounded by the failure to apply the bedrock MMPA principles discussed in this letter. On the separate population stock issue alone, the main problems with the agency record are as follows: · NMFS suggests that the PCFG must be a "closed" stock to be considered separate for MMPA purposes. SDEIS at 30, 33. As a legal matter, NMFS ascribes far too narrow a definition of what constitutes a population stock. There is nothing in the MMPA definition in section 3(11) ("a group of marine mammals of the same species or smaller taxa in a common spatial arrangement that interbreeds when mature") which requires that there be a "closed stock," or that interbreeding not occur between ENPs and PCFG animals.	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			· NMFS claims that recruitment into the PCFG is equally from internal and external sources.16 This statement is not correct. There is insufficient evidence to support that conclusion. The evidence simply does not answer the question of the levels of recruitment from inside and outside the PCFG. · NMFS argues that is "unknown" whether a calf will return to feed in subareas of the range where it has fed with its mother. Again, being unknown does not mean, under the MMPA, that the determination should be made that it does not happen. To the contrary this level of uncertainty means either that a conclusion cannot be made or that the benefit of the doubt must be given to the PCFG that the calves do return to that location to feed. · Photo identification, according to NMFS, demonstrates large-scale movements and variability in PCFG distribution due to prey availability, which in turn means there is an obvious and natural mechanism for new whales to join the PCFG. Again, as noted above, the MMPA definition of population stock does not preclude such intermingling of ranges between stocks. · In addition, Bickham's testimony establishes additional uncertainty, and calls NMFS's own conclusions on the lack of stock discreteness into question. He finds the statistically significant genetic differences between eastern and western gray whales surprising, given the degree of intermixing between the two populations during the migration and mating season. He believes that the reason is the result of genetic drift in a small, isolated population.17 This conclusion confirms the uncertainty in NMFS's recruitment requirement in designating a separate stock. If there is an extremely high amount of intermixing between ENP and WNP, but they are still separate stocks, could that also apply to PCFG somehow? · NMFS also fails to give due deference to the findings of other expert agencies. NMFS disregards the finding of the Committee on the Status of Endangered Wildlife in Canada (COSEWIC) that the PCFG, which it	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			shares with U.S. The Canadian government has now taken the next step, as of October 3, proposing that the PCFG should be added to its endangered species category under the Species at Risk Act. See Attachment 3. Clearly, making an affirmative finding, as the SDEIS does on the absence of a PCFG stock that contradicts the now proposed endangered status finding of a country that shares the same population is inconsistent with the international conservation purpose of the MMPA and fails the section 103(a) finding of necessity and appropriateness test required for a waiver. The flip side of the agency's reliance on problematic evidence and analysis is its failure to look at the record in the light most favorable to the marine mammals, as it is required to do. If it had done so on the PCFG issue, an appropriate and legally defensible line of reasoning would have gone as follows. *The PCFG As Distinct Stock/Management Unit.* Contrary to the NMFS argument and the RD finding that the PCFG is part of the larger ENP population, there is considerable evidence that it is indeed a separate stock. For the most part, NMFS simply ignores this evidence and fails to explain why it should be discounted. For example, photo-identification data shows the PCFG is largely made up of a small group of whales seen repeatedly and in multiple years from N California to SE Alaska from June to November (Calambokidis et al. 2019). It is estimated at under 250 whales, and these are heavily made up of the same individuals seem repeatedly year and after year; an average of 157 individuals were identified each year with 95% of the encounters with whales summer/fall in the PCFG range made up of whales seen multiple years. The recruitment appears to be largely internal with data through 2015 showing that 62 PCFG mothers were documented with 102 calves	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			and that 65% of calves seen (through 2014) had been seen in a subsequent year in the PCFG range recruited to this group (Calambokidis and Perez 2017a). While there were other whales not documented as calves that were recruited to the PCFG, many of these may have been born from PCFG mothers as well since the average wean date for calves was found to be August 1, indicating many likely calves would have only been sighted after weaning and not recognized as calves. In addition, two studies have examined and tested for differences in the mtDNA sequences in PCFG whales compared to other portions of the gray whale population (Frasier et al. 2011, Lang et al. 2014). These were largely based on two different sets of samples collected from the PCFG with Frasier et al. relying on 40 samples from PCFG whales almost exclusively from Canadian waters and Lang et al. (2012) using 113 PCFG samples largely collected in US waters. These two studies compared the PCFG samples in one case to 105 from the migratory population (Frasier et al. 2011) or 75 samples from animals from Arctic feeding grounds (Lang et al. 2014). Despite these differences in samples and comparison, both studies found similar results with significant differences in haplotype frequencies between the PCFG and the comparison sample. Frasier et al. (2011) estimated these differences would represent an exchange rate of <<1% per generation between the two maternally based groups. Frasier et al. (2011) concluded that their genetic results, in combination with photo-identification data demonstrating strong maternally directed fidelity to summer feeding grounds, demonstrated that the PCFG should be treated as a separate Management Unit. NOAA guidelines (https://repository.library.noaa.gov/view/noaa/22660): Martien et al. (2019) summarize the lines of evidence for delineating stocks of marine mammals and identified 11 types of evidence and their	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			relative strength and identify genetics as one of only three of these lines evidence that across all three taxonomic groups of marine mammals constituted a "Strong" line of evidence which they define as suitable to "be used alone to delineate Demographically Independent Population." Another of the three lines of evidence considered "Strong" was movement data, something that has been demonstrated as being different for PCFG whales from both photographic identification (Calambokidis et al. 2019) and satellite tag data (Lagerquist et al. 2019). Finally, following the COSEWIC status assessment November 2017, the previous ENP population was split into three populations; North Pacific Migratory population (Not at Risk), Pacific Coast Feeding Group population (Endangered), and the Western Pacific population (Endangered). Now, Fisheries and Oceans Canada has proposed endangered status for the PCFG, a fact not considered in the SDEIS or the record of the waiver proceeding. See Attachment 3. Weller et al. (2013) reported on a NMFS gray whale stock identification workshop, held July 31 to August 2, 2012, that evaluated the key question about whether the PCFG should be treated as a distinct stock. While some descriptions of this workshop have been cited as supporting the agency not identifying the PCFG of the stock, the opposite is actually true given: · The Task Force (TF) consisted almost solely of NMFS scientists or affiliates and did not include outside experts from the U.S. or Canada who have been primarily involved in study of the PCFG. · This meeting was held two years before the publication of the Lang et al. (2014) publication that provided the most robust evaluation of genetic differences. · Rather than concluding that the PCFG was not a stock their key conclusion was "the TF was unable to provide definitive advice as to	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			whether the PCFG is a population stock under the MMPA and the GAMMS guidelines." · The reported scoring of the seven scientists on the TF that voted on key questions revealed interesting insights on key questions related to the PCFG. All "Strongly" or "Somewhat Agreed" that the ecosystem occupied by the PCFG when they are feeding differ from the other ENP whales. All voting participants voted that the genetic data and simulations indicated most probably that at least half or more recruitment to the PCFG was internal. A majority of the voting participants were either neutral or thought given all lines of evidence the PCFG should be considered a population stock under the agency's interpretation. In addition, there is currently available information that is relevant to the stock discreteness issue that has not been included in the SDEIS or elsewhere in the waiver record, with the result that the best available scientific information has not been accounted for. This information includes: 1. When the collection of biopsy samples from PCFG whales (with an emphasis on females) that ended up being used for the Lang et al. (2014) study was originally proposed and conducted it was only in part to test for mtDNA differences. It was also intended to help inform the question of internal versus external recruitment to the PCFG by looking at genetic evidence of relationship and offspring of newly recruited to known PCFG mothers to see if some of these new recruits could be calves of PCFG mothers that did not get detected while they were still associated with their mothers (very possible given that average weaning date for PCFG calves was estimated as of August 1, which is earlier than some of the initial documentation of PCFG whales in current research efforts (Calambokidis and Perez 2017a). The SDEIS does not include an analysis of this genetic	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			basis for internal recruitment from this large sample of collected biopsies, although the information is available. 2. The development of new matching algorithms and projects currently underway to match identifications of whales especially mothers with calves with the PCFG catalog also promise to provide additional insight into recruitment of PCFG whales and test the degree to which internal recruitment into the is being underestimated. This ongoing study has yielded some initial results of internal recruitment that should be available to NMFS and has to be taken into account as part of the record for this proceeding. Taken together, even on a level playing field, the evidence supports a finding that the PCFG is most likely to be a separate stock. That conclusion is even more compelling when the conservative bias of the MMPA is applied. Without question, under the evidence and MMPA principles, there is an insufficient basis to conclude, as NMFS witnesses and the ALJ have, that "NMFS's determination that PCFG whales do not constitute a separate stock is supported by best scientific evidence currently available and that NMFS included adequate protections for PCFG whales in the proposed regulations." ALJ RD at 155. The SDEIS falls victim to the same mistake when it concludes "the PCFG is not considered a stock under the MMPA." SDEIS at 29. For these reasons, NMFS must revisit the PCFG population stock, OSP, disadvantage test, and section 103(d) determination questions. These flaws in the record can best be resolved through an opportunity for a supplemental hearing, which would also cure the NEPA and MMPA procedural regulation violation discussed at the outset of this letter and allow new evidence to be taken into account. Following this prudent cause of action now should lead to an objective and	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			fully informed basis for a final decision by the Administrator that adheres to the MMPA and serves as the basis for the most scientifically accurate and legally defensible outcome on the Makah waiver request. NMFS tries to deflect the significance of its decision to include the PCFG within the overall ENP population by rolling out an evaluation of the effect of the take that could occur under the hunt under a potential biological removal (PBR) evaluation. SDEIS at 29–30. However, PBR is not a test for a waiver. PBR has a legally-defined role under the MMPA only in the section 118 domestic fisheries incidental take regime. The calculation of PBR is for evaluating the effects of the Makah hunt is only one point of information, and it is not of controlling regulatory effect and does not excuse NMFS from making the required findings for a waiver and waiver regulations. Moreover, NMFS does not estimate how the hunt would compare to PBR for the PCFG, if it were a separate stock. --- 4. 16 U.S.C. § 1361(6). 5. Id. §1361(2). 6. Id. §1361(3), (4). 7. Id. §1371(a)(3). 8. Supp. 173, 179 (D.D.C. 1992) ("What emerges somewhat more clearly from all of the above is Congress' general concern about protecting marine mammals from human depredations"). 11. 16 U.S.C. § 1373(d). 12. Id. § 1373(d)(1)–(4). 13 .See also Carretta et al. 2020a, U.S. Pacific Marine Mammal Stock Assessment: 2020. Gray Whale (Eschrichtius robustus): Eastern North Pacific Stock and Pacific Coast Feeding Group at 162; Bettridge First Decl. ¶¶ 11, 17; Weller Decl. ¶¶ 10, 35; Scordino Decl. ¶ 71; Bickham Decl. ¶¶ 20, 63. 14. Id. 15. NMFS itself adopted this position in its brief in the 1977 tuna dolphin general permit proceedings, and it has been a fundamental principle of the MMPA ever since—if a species or stock is depleted or of uncertain status it cannot pass the disadvantage test. As stated in the September 26, 1977 NMFS brief at page 16: "Thus, the mandate given to NMFS from the Act is clear: no commercial activity involving marine mammals can be undertaken unless NMFS is assured that the taking is not to the	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			disadvantage of the marine mammals, that no affected stocks are depleted and that the other policies of the Act are satisfied. This assurance is required no matter what the economic harm may be. Because NMFS is not assured that the eastern spinner is at or above the lower end of optimum sustainable population, NMFS asserts that it must retain the finding of depletion for the eastern spinner." Attachment 1; see also, Attachment 2, Brief of Marine Mammal Commission at 7 (Sept. 26, 1977) ("when there is doubt [as to depleted status] it is desirable to maintain the status quo and make changes if new information provides the basis for such changes"). This is the same situation for the PCFG, but NMFS tries to deflect the OSP question be denying the threshold question of the existence of a stock. It cannot escape the logic of its stance on eastern spinners, however, because the question of whether the PCFG is a separate stock is wrapped in as much uncertainty as the depletion question for eastern spinners. Until the uncertainty is resolved, like eastern spinners, the PCFG cannot be subject to take due to the failure of NMFS and the Tribe, bearing the burden of proof, to satisfy the disadvantage test. 16. Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			The SDEIS Treatment of the PCFG Population Stock Issue is Contrary to the Ecosystem Health and Stability Objective of the MMPA. The PCFG stock discreteness issue is not only necessary to determining if the Makah hunt satisfies the requirements for a waiver, it also goes to the heart of the ecosystem health and stability primary objective of the MMPA. The MMPA states that "it is the sense of the Congress that [marine mammals] should be protected and encouraged to develop to the greatest extent feasible commensurate with sound policies of resource management and that the primary objective of their management should be to maintain the health and stability of the marine ecosystem."The MMPA uses the terms "stock," and "population stock" to indicate management units and defines those terms to mean "a group of marine mammals of the same species or smaller taxa in a common spatial arrangement, that interbreed when mature."However, marine mammal stock structure is not fixed and constant, but rather always evolving, albeit at variable paces. In rare cases new stocks may be formed almost instantaneously, such as when a small group of marine mammals is isolated by a major environmental event (e.g., harbor seals in a lake or bay isolated by a collapsing glacier). More commonly, new stocks form because of isolation over years, decades, centuries, or millennia.Stocks change in response to various selective forces in their environment, and their ability to evolve is central to their persistence. Protecting groups of marine mammals in transition is particularly critical now, because of the multiple strong selective forces imposed by human activities (e.g., hunting, habitat destruction, climate change). An inability to adapt or evolve is perhaps the surest route to extinction. This is true of a feeding aggregation, which may very well be an actual stock, or a stock that is int eh process of forming as a part of the evolving marine environment.In fact, contemporaneous marine mammal science is coming to recognize the importance of groups of marine mammals that move together for a variety	See Appendix C Responses to Frequent and Substantive Comments #5-Stock status of the Pacific Coast Feeding Group (PCFG) of ENP gray whales.The DEIS, SDEIS, and FEIS acknowledge that stock structure may change and must be re-evaluated. The Stock Assessment Report process under the MMPA is the primary tool for these evaluations. These reports are published annually and undergo both scientific and public review. While the PCFG is not recognized as a stock, the DEIS, SDEIS, and FEIS evaluate the effects of the action on this feeding group and the ecosystem, which is assessed at a range of scales.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			of biological reasons, including feeding, and that these units, sometimes referred to as "herds, are the appropriate focal point of MMPA conservation and management actions. For example, NMFS is treating humpback whale herds as animals that travel in groups between a feeding area and a breeding area as a demographically independent population (DIP), in essence recognizing those animals as a unit, even though they might intermix with other humpback whales from other feeding areas on the breeding ground. See https://repository.library.noaa.gov/view/noaa/33497; https://repository.library.noaa.gov/view/noaa/33457. Following such an approach for the humpback DIP, as well as for the PCFG, reflects the best available current scientific methodology by NMFS for unique aggregations of marine mammals and is consistent with the guidelines set forth in Martien, K.K. et al., The DIP Delineation Handbook: A Guide to Using Multiple Lines of Evidence to Delineate Demographically Independent Populations of Marine Mammals, NOAA-TM-NMFS-SWFSC-622.The idea that only definitively identified marine mammal stocks with little or no interbreeding defined under the rigid formulation (i.e., closed population) followed by NMFS for the PCFG warrant conservation as an MMPA "population stock" is inconsistent with the "primary" objective of maintaining the health and stability of the marine ecosystem. Groups of marine mammals not recognized as full and discrete stocks (e.g., feeding aggregations) are, nonetheless, essential components of the marine ecosystem. Such groups play a critical role in the ecology of marine ecosystems, mainly through their foraging effects, which are substantial in the case of gray whales. Their loss may substantially, if not profoundly, degrade the marine ecosystem, as has also been observed when individual species are removed from terrestrial ecosystems. Thus, the health and stability of the marine ecosystem—the primary objective of the MMPA—cannot be maintained over time if such groups are not	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			protected.Throughout their testimony, expert witnesses Weller and Bickham note that the information on recruitment, genetics, and discreteness is not sufficient to conclude that the PCFG forms a distinct stock and, for that reason, it does not warrant protection under the MMPA.18 But that conclusion fails in three important respects. First, we do not have all the information needed to make that judgement with full and absolute confidence. The fact that studies are still ongoing and that scientists continue to debate this issue argues that we do not have all the information needed to be conclusive.Second, we cannot satisfy the primary objective of the MMPA if we do not protect the PCFG, even if even if we conclude that the evidence indicates that it is not a definitive stock. Interpretations of the MMPA have mistakenly concluded that protecting only well-defined stocks is sufficient to maintain the health and stability of the marine ecosystem. Unfortunately, that is not the case.Finally, as explained repeatedly in my comment letters, the Weller/Bickham conclusion on the lack of sufficient evidence to establish the existence of a separate stock leads to the required legal outcome of giving the PCFG full MMPA protection, not allowing it to be subject to exploitation. Clearly there is good evidence of stock discreteness. That evidence is in many ways stronger than the evidence of the ack of discreteness. As a result, the uncertainty that exists means that the PCFG must be protected from exploitation under a waiver until a clear and definitive finding can be made. ----------18 See Bickham Decl. ¶¶ 10–11, 14, 20; Weller First Decl. ¶¶ 18–20, 26–32; Weller Second Decl. ¶¶ 3, 13–23; Weller Second Decl. ¶¶ 8, 11.	
			The SDEIS Is Incorrect in Asserting that an Incidental Take Authorization Could Be Issued for the Take of Endangered Western North Pacific Gray Whales During the Makah Hunt	We note the legal arguments contained herein, but the purpose of the FEIS is to provide information, not resolve legal disputes.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			The SDEIS indicates that NMFS would authorize the take of the WNP whales pursuant to an incidental take authorization (ITA) issued under section 101(a)(5)(A) of the MMPA. SDEIS, at 9, 11. As discussed in my last letter, the notion that the deliberate act of shooting at, or otherwise hunt, any marine mammal when the purpose is to kill that animal is "incidental take" is a non-starter. Three elements of the MMPA take definition are implicated (harass, hunt, kill), and even if it can somehow be argued that a WNP whale is killed or harassed by accident or incidentally, there is no such claim that the art of "hunting" that individual whale was not intentional and non-incidental. The Makah hunters would have singled out that individual animal for take by hunting it. It would be a direct take, not subject to section 101(a)(5)(A). Simply put, there is no "whoops, wrong whale" provision in section 101(a)(5)(A) for incidental take authorization. The deliberate and premeditated act of hunting and shooting a whale with the intent to kill it can in no way be considered "incidental take" under the MMPA. As reported in my November 15, 2021 letter, never, in the history of the MMPA has section 101(a)(5) been used for such a purpose. The attachment to this letter further updates the supporting research for that conclusion, showing an additional 14 ITAS that have been issued since my last letter, all of which cover truly incidental take where there is no intent to kill the marine mammal that is the subject of the action. See Attachment 4. Simply put, the incidental take authority of the MMPA cannot be stretched so far as to allow the Makah Tribe to hunt, harass or kill any WNP, if a waiver cannot be granted for that purpose the take cannot be allowed. Any other result pushes this waiver proceeding over the brink into the realm of Kabuki theater where the MMPA is being postured to achieve the desired result of issuing the waiver rather that applying the law fully	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			and properly. Such a result cannot be countenanced, and if the waiver is dependent upon take authorization of the WNP, then the waiver cannot be granted.	
			The SDEIS Fails to Explain How NMFS Will Comply with the Coastal Zone Management Act. It appears that NMFS has not yet complied with the CZMA consistency review requirement. The SDEIS does not address the relationship of the waiver decision to the CZMA; however, section 1.6 of the 2015 DEIS does raise this issue. Under this section, NMFS states that the CZMA is an authority that may apply to the whale hunting activities. It further states that the CZMA "requires federal agencies to ensure that activities carried out in or outside of the state's coastal zone are consistent with the enforceable policies of approved state management plans, to the maximum extent practicable. NMFS may consult with Ecology" (emphasis added). [add cite to page in footnote] However, the CZMA does not simply establish that NMFS may consult with the Washington CZM Program, but rather that when consistency is triggered, it must consult. For the reasons discussed in this section, until the consistency review has been conducted, no decision can be made on the Makah waiver request.Under the CZMA, states and territories may establish a Coastal Zone Management (CZM) Program with the authority to implement enforceable policies for the management of their coastal resources.19 Upon establishment of a CZM Program, the state or territory has the authority under section 307 of the CZMA to review whether actions of federal agencies within and outside of the coastal zone which have reasonably foreseeable effects on coastal land and water are consistent to the maximum extent practicable with the enforceable policies of the program.20 Federal actions include both direct actions of federal agencies, as well as non-Federal actions that require a Federal license or permit.21 When a federal agency is taking an action that requires federal	NMFS submitted a consistency determination for the ALJ's recommended decision to the Washington State Department of Ecology pursuant to Section 307 of the CZMA on April 18, 2023. The Department of Ecology reviewed our determination and concurred that the proposal is consistent with Washington Coastal Zone Management Plan on June 2, 2023.(see section See Section 1.2.5).

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			consistency review, the agency is required to consult with the CZM Program on a consistency determination "at the earliest practical time in the planning or reassessment of the activity" and before the agency "reaches a significant point of decision making."22 In accordance with the CZMA, the federal action of issuing a waiver under the MMPA for the Makah hunt requires NMFS to make a federal consistency determination and provide Washington State's CZM Program, under the Washington Department of Ecology (Ecology), with an opportunity to review that determination.Admittedly, NMFS would incur some cost and administrative inconvenience by needing to contract for ALJ services and to conduct the proceeding. The fact remains that the law requires such a result, and the cost/inconvenience factors for a required hearing pale in comparison these what would result from a remand.Washington State established an approved CZM Program in 1976. Under the Washington CZM Program, the State's network of laws and regulations, including the Water Pollution Control Act, Clean Air Act, Environmental Policy Act, Ocean Resources Management Act, and the Shoreline Management Act, 23 have been submitted to NOAA and formally approved, in whole or in part, as enforceable policies for which the State can review federal actions for consistency.24Federal agency actions which are within the coastal zone, as well as those outside of the coastal zone that will have impacts on the coastal zone and which have reasonably foreseeable effects on land and water uses and natural resources of the coastal zone.25 In order to be reviewable, the action is not required to occur within the coastal zone, but instead to simply have an effect on the coastal zone.26 It must also only be reasonably foreseeable that the federal action will have an effect on the coastal zone resources, which means that "the impact is sufficiently likely to occur that a person of ordinary prudence would take it into account in reaching a decision."27 Further, under NOAA's definition of natural resources of the coastal zone, natural resources are not limited only to	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			those that are entirely in the coastal zone or always in the coastal zone, they may include wildlife species which travel through the coastal zone, such as marine mammals.28 As stated in California Coastal Commission v. Norton, activities "that may permanently injure marine mammals affect the coastal resources and require a consistency determination" and further that an impact on the entire population [of marine mammals] is not necessary to require a consistency determination.29 Since it is certain that the issuance of a waiver for the Makah hunt would have an effect on gray whales, which are migratory resources that are present within Washington's coastal zone, the waiver is a federal action under the CZMA.Under the CZMA, Washington's CZM Program has the authority to review for consistency all Federal agency actions which are within the coastal zone, as well as those outside of the coastal zone that will have impacts on the coastal zone and which have reasonably foreseeable effects on land and water uses and natural resources of the coastal zone.25 In order to be reviewable, the action is not required to occur within the coastal zone, but instead to simply have an effect on the coastal zone.26 It must also only be reasonably foreseeable that the federal action will have an effect on the coastal zone resources, which means that "the impact is sufficiently likely to occur that a person of ordinary prudence would take it into account in reaching a decision."27 Further, under NOAA's definition of natural resources of the coastal zone, natural resources are not limited only to those that are entirely in the coastal zone or always in the coastal zone, they may include wildlife species which travel through the coastal zone, such as marine mammals.28 As stated in California Coastal Commission v. Norton, activities "that may permanently injure marine mammals affect the coastal resources and require a consistency determination" and further that an impact on the entire population [of marine mammals] is not necessary to require a consistency determination.29 Since it is certain that the issuance of a waiver for the Makah hunt would have an effect on gray

			whales, which are migratory resources that are present within Washington's coastal zone, the waiver is a federal action under the CZMA.The Washington CZM Program would review the federal action for consistency with its enforceable policies. Washington has at least one enforceable policy that is relevant to the waiver—RCW 43.143.030— but others may also apply.30 RCW 43.143.030 requires any activity which requires a federal, state, or local permit or other approvals that will adversely impact renewable resources and marine life, among other things, to meet the following eight criteria: (a) There is a demonstrated significant local, state, or national need for the proposed use or activity;(b) There is no reasonable alternative to meet the public need for the proposed use or activity;(c) There will be no likely long-term significant adverse impacts to coastal or marine resources or uses;(d) All reasonable steps are taken to avoid and minimize adverse environmental impacts, with special protection provided for the marine life and resources of the Columbia River, Willapa Bay and Grays Harbor estuaries, and Olympic national park;(e) All reasonable steps are taken to avoid and minimize adverse social and economic impacts, including impacts on aquaculture, recreation, tourism, navigation, air quality, and recreational, commercial, and tribal fishing;(f) Compensation is provided to mitigate adverse impacts to coastal resources or uses; (not an enforceable policy); (g) Plans and sufficient performance bonding are provided to ensure that the site will be rehabilitated after the use or activity is completed; and (h) The use or activity complies with all applicable local, state, and federal laws and regulations.31When a federal agency is taking an action that requires federal consistency review, such as the decision on the Makah waiver request, the agency is required to consult with the CZM Program on a consistency determination "at the earliest practical time in the planning or reassessment of the activity" and before the Federal agency "reaches a significant point of decisionmaking."32 At a minimum, the federal agency	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			must provide the state the opportunity to review a consistency determination at least 90 days before final federal approval.33 While NMFS may be more than 90 days away from issuing a final decision, it has already reached "a significant point of decisionmaking" with the ALJ issuance of the RD. Thus, the CZMA Consistency Consideration requirement has already been triggered. Clearly, some of the elements of Washington enforceable policy RCW 43.143.030 are implicated in the Makah hunt (e.g., significant need for the proposed action; likely long-term significant adverse impacts to coastal or marine resources; all reasonable steps are taken to avoid or minimize adverse environmental impacts; all reasonable steps are taken to avoid or minimize adverse impacts to tourism and recreation). NMFS, therefore, needs to explain for the record when and how it intends to comply with the CZMA. Ultimately, the failure of NMFS to consult with the Washington CZM Program would constitute a violation of the CZMA. --- 19. 16 U.S.C § 1455; 15 C.F.R § 923.41.20. 16 U.S.C § 1456; NOAA, Federal Consistency (August 12, 2022), https://coast.noaa.gov/czm/consistency/.21. 16 U.S.C § 1456; 15 C.F.R. § 923.53.22. 15 C.F.R § 930.36.23. 			Conclusion The Makah waiver request is not currently postured to result in a decision that complies with the MMPA, NEPA or the CZMA. Procedurally, the SDEIS needs to be made available for consideration at an on-the-record hearing and NMFS must comply with the CZMA. Substantively, the ground rules for decision making need to be brought back to the fundamental principles that have guided the MMPA for its 50 years of the precautionary approach in favor of marine mammals and heavy burden of proof on the party seeking to exploit the species. The no disadvantage to marine mammals test must be met, which requires a conservative judgment on the discreteness of the PCFG (including its status as a DIP). The possibility of a future application for an ITA for the hunting and injury or	We note the legal arguments contained herein, but the purpose of the FEIS is to provide information, not resolve legal disputes or determine the next steps in the waiver proceeding.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			killing of the WNP needs to be ruled out as a matter of law. Over the course of the MMPA, NMFS has taken many favorable actions to advance the purposes and policies of the law. It is also the case, however, that for every decade of the MMPA's existence, NMFS has embarked on decision-making forays on controversial issues where the bedrock principles of the law have been cast aside or given short shrift so as to reach a desired policy result, only to be defeated in court. The initial tuna dolphin permits of the 1970s, the Dall's porpoise permit of the 1980s, the failure to designate the southern resident killer whale (SRKW) population for separate listing under the MMPA and Endangered Species of the 1990s, the chase and encirclement/dolphin safe label studies of the 2000s, and in the 2010/2020s, the failure to impose the burden of proof on parties seeking to exploit marine mammals or take actions that cause harm to them (e.g., whale watching in Puget Sound and the SRKW; fishing and vessel traffic in New England and the North Atlantic right whale; full enforcement of Mexican law by Mexican authorities and the vaquita in the Gulf of California). In each case, the burden has instead been left to third party advocates to come forward to try and enforce conservation and protection under the terms of the MMPA. The Makah waiver runs a significant risk of being added to the litany of NMFS failures rather than successes. It assumes this place not because the waiver necessarily cannot be granted (that verdict is still out), but instead because NMFS is failing to adhere to the foundational principles of the MMPA and apply the tools that are required to reach a decision. The avenue for doing so remains readily available and should be adopted without further delay by NMFS so that a proper decision, based on a complete record, and in furtherance of the MMPA findings and declarations of policies, can be made.

			Environmental Impact Statement (SDEIS) we insist that there are relevant aspects that are no taken in account. So we will analyze what the Marine Mammal Protection Act (MMPA) determines and then we will address the most important points namely: The primary objective of marine resource management under the MMPA is to maintain the health and stability of the marine ecosystem, points about current and future levels of marine mammal species and populations; The existing obligations of international treaties and agreements of the United States.Based on our following arguments and findings our opinion is that the waiver should not be granted:· The Marine Mammal Protection Act and the health of Ecosystems: The MMPA establishes about that the primary objective of marine management is the health and stability of ecosystems: “The primary objective of marine resource management underthe MMPA is to maintain the health and stability of the marine ecosystem. 16 U.S.C. § 1361. To that end, the principal goal is for marine mammals to achieve and maintain their optimum sustainable population (OSP), meaning “the number of animals which will result in the maximum productivity of the population or the species, keeping in mind the carrying capacity of the habitat and the health of the ecosystem of which they form a constituent part.” 16 U.S.C. § 1362(9). (pag 26-27) Similarly, and essential for this work is that the Act for the Protection of Marine Mammals (MMPA) establishes in Section 103, paragraph (b) the regulations that must be taken before approving any the extraction of marine mammals: "When prescribing such regulations, the Secretary will take fully into account all the factors that may affect the extent to which such animals may be taken or imported, including, but not limited to, the effect of such regulations on: 1. - Current and future levels of marine mammalspecies and populations;2. - The existing obligations of international treaties and agreements of the United States3. - The Marine Ecosystem and related environmental considerations4. - The conservation,	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			development, and use of fisheries resources5. - The economic and technological viability of the implementation	
			· Marine health ecosystems, and levels of species and populations: The marine ecosystem is a living system in which all elements(animals, plants and elements) play a fundamental role in maintaining their balance and health. The integral management of human activities must be based on the best available scientific knowledge about the ecosystem and its dynamics, in order to identify and act on the influences that are critical to the health of marine ecosystems, thus achieving a sustainable use of the goods and services of the ecosystem and the maintenance of their integrity1. As we stated before the UNEP-FAO-UNESCO report "Blue Carbon, the role of healthy oceans binding carbon" established that the ecosystem perspective and management should focus on climate change adaptation and mitigation measures, which in turn would lead to improvements in health, food security and productivity. The conservation of carbon sinks would be the focus of these measures2.The ocean is the world's largest carbon sink, accounting for 20 to 35% of atmospheric carbon emissions and 93% of the carbon dioxide stored and processed. It has been scientifically discovered that in addition to plankton, marine vertebrates intervene in different ways and pathways in the carbon pump, with multiplying effects that have not been well studied, such as large aggregations of fish and other vertebrates, which have been called "fish carbon". In healthy marine ecosystems, marine vertebratesfacilitate uptake of atmospheric carbon into the ocean and transport carbon from the ocean surface to deep waters and sediment, thus providing a vital link in the process of long term carbon sequestration3	The FEIS describes gray whales' role in the marine ecosystem, including, "whale falls" and evaluates the impacts of the alternatives on the ecosystem at various scales. For example, see Subsections 3.4.3.1.2, Feeding Ecology and Role in the Marine Ecosystem, and 4.3.3.2.2, Benthic Environment, of the FEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Whales play a fundamental role in the balance, health and maintenance of marine life as we have stated in our previous opinion, and therefore in primary productivity and climate change mitigation, since they are the most important carbon sinks in the system. In general, it can be said that whales perform four eco-systemic functions: They are predators; they are food for predators;they carry nutrients for primary production; and they are huge carbon reservoirs when they die and fall into the seabed. Thus, it was established that stopping the degradation of oceanic and coastal ecosystems would reduce the vulnerability of coastal communities and could even be a source of economic income generation, contrary to what was previously thought,that preserving nature implied an economic loss. Just as it is important to conserve forests and jungles as green carbon sinks, the need to avoid the loss and deterioration of blue carbon sinks, that is, those originating from the oceans and coastal areas, which remain hijacked on the ocean floor for millennia; much more than remains kidnapped in forests4. Today it is known that whales play a fundamental role in maintaining the health conditions of the oceans, in particular they have positive effects on primary productivity, since they take nutrients from the depths to release and disperse fecal matter on the surface by releasing nitrogen that is used by primary producers. In other words, they play a role of primary fertilizers. Especially baleen whales, as isthe case with the gray whale, need large food congregations, which they find in the waters of the Bering and Chuckchi Sea, where they feed, the krill, of which they need large quantities. The mechanism through which whales transport nutrients from one side to the other either vertically, falling towards the seabed and also	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			horizontally due to their long migrations is known as the "WhalePump”5. Thus, it was established, through scientific knowledge of the functioning of ecosystems that stopping the degradation of oceanic and coastal ecosystems would reduce the vulnerability of coastal communities and could even be a source of economic income generation, much contrary to what was previously thought, that preserving nature implied an economic loss. Today it is known that conserving nature is the best measure to achieve a sustainable marine economy. Just as it is important to conserve forests as green carbon sinks, the need to avoid the loss and deterioration of blue carbon sinks, that is, those originating from the oceans and coastal areas, which remain sequestrated on the ocean floor for millennia, was highlighted; much more than what remains in forests and jungles. In such a way that there is an ecosystem relationship between all the organisms participating in this mechanism. At the same time, whales are deposited on the seabed at the seabed, making them carbon sequestration sites, known as sinkholes, which are as or more important than coal sequestration in forests and jungles. Moreover, an economic assessment can be made of the contributions of whales for conservation, which can be incorporated into the economic perspective of countries. Once again, whales are better worth alive than dead. It is pertinent to emphasize that recent studies have estimated that phytoplankton in the North Pacific has decreased approximately between 8 and 10% in the last century and that this may be due to the effects of climate change, but also to the intense commercial hunting of whales, thus decreasing the pollination effect with the subsequent decrease in nutrients.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			· Mass stranding and mortalityAnother element that must be strongly taken into consideration is that since January 1, 2019, a very large increase in the mortality of gray whales began to be noticed throughout their migration route. On May 3, 2019, the office in charge of the National Atmospheric and Oceanic Administration (NOAA) officially declared that a phenomenon of mortality and unusual gray whale stranding (UME) was in progress along the entire migration coast, from the north pole to its breeding grounds in Mexico, very similar to an event that occurred just over 20 years ago, which lasted two years and killed 25% of the whale population.This time the phenomenon of strandings is still in process and the records of strandings from its beginning until June 3, 2022 shows that a total of 578 strandings have been recorded, of which 279 have been on the coast of Mexico, which represents 48.3 of all the strandings registered in the three countries (See Table 1). [see letter for table]However, we must emphasize and it is recognized even by the NMFS, that mortality is much higher, since only whales that are stranded on the coast have been counted, but the number of those that die at sea and are dragged, or sink, is unknown. The latest update presented by the June Draft Environmental Impact Statement (DEIS) this year, recognizesthat the 1999 Event only lasted two years, after which the recovery of the species was observed, but that it is not possible to predict the duration of this Unusual Mortality Event (UME).Even so, in the middle of the fourth year of mass strandings and real ignorance of their causes, the administrative process has continued, and it concludes that whaling would not have impact on the whale population. The most that has been done is to propose 6 different scenarios in which the number of whales to be hunted is reduced, as well as the "strucks " in training. And the temporalities are modified as well asthe total number of days to hunt in summer and winter. But in total there would be (in alternative VII,) 12 harponed and arrived, 15 harponed and lost whales, plus the whales beaten in training.More than the discussion of	See Appendix D Responses to Frequent and Substantive Comments #19-Ongoing UME. See also Section 3.4, Affected Environment-Gray Whales, and Section 4.4, Environmental Consequences-Gray Whales, of the FEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			the six alternatives, we will focus on the points that we believe that the NMFS authorities are failing to analyze and relate to the authorization to hunt gray whales. Strandings have not ceased, the population is decreasing, the body condition isstill poor, and the calves production is very low. And there is no satisfactory explanation.	
			· Poor Nutrition and Body Condition It is important to note that many of the stranded whales were found in a state of emaciation, that is, very thin and in very poor body condition, which has been related by some scientists to the loss of abundance of their food in the feeding sites in the Bering Sea, and that consists of amphipods and small crustaceans that whales capture in the seabed. This decrease in food for gray whales may be related to the effects of climate change, but also to the effects of the past decrease in whales due to commercial hunting as I mentioned earlier and the consequent decrease in the food source, which would cause the thinning of the whales and the lack of energy to make the long journey and reach the breeding areas. However, there is also the hypothesis that some disease may be in process, probably infectious that has not yet been identified, but that is impacting not only on an increase in mortality but also on the reproductive capacity of gray whales7 At the same time that strandings have been found, it was discovered that the whales that reach the breeding lagoons in Mexico are, many of them in poor physical condition, that is, with great losses of fat and muscle mass. First of all, there was a decrease in the number of female-calves and an increase in the number of skinny whales for the period 2019-2021. Several researchers suggest that this enormous and worrying weight loss in whales may be due to the decrease in their food in the northern seas, with the consequence that they do not ingest enough food and energy for migration. It is known that since the late 1980s there has been a decrease in the abundance of food from the biomass of amphipods that are the food of	See Appendix C Responses to Frequent and Substantive Comments #19-Ongoing UME. See also Section 3.4, Affected Environment-Gray Whales, and Section 4.4, Environmental Consequences-Gray Whales, of the FEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			gray whales, mainly in the so-called Chirikov Basin, which is the main feeding area of gray whales.The result is that year after year gray whales have arrived in worse body conditions8. [see letter for graphic] This phenomenon has manifested itself with the least presence of females with offspring in the breeding lagoons in Mexico. This last season was characterized by the low number of births and a 20% increase in whales in poor body conditions in addition to an earlier migration to the north. For 2022, it was found that this phenomenon continues: a total of 278 whales were identified and photographed, of which it was found that the percentage of whales in good condition was 43%; regular condition 37.5% and poor body condition 19. 5%. This data contrasts with those recorded after the UME registered for 2009-2011, in which the percentage of whales in poor physical condition was 7.6 by 2009 and 4.9% in 20119 (See graph 1). [see letter for graphic] Trends of percentage of gray whales by body condition] In general terms the trend of good condition has increased and the poor condition has slightly decreased, but still present in almost 20% of single whales. Scientists report that the main cause of the current Grey Whale Unusual Mortality Event (UME) has not been identified so far. It is likely that this event has multiple causes, including mortality linked to predatory by killer whales, trapping in fishing nets, collisions with boats and poor body condition possibly associated with ecosystem changes in sub-arctic and arctic feeding areas10. But probably infectious causes have not been completely studied 11.. Similarly, scientific hypotheses suggest that if whales do not feed enough during the summer, whales reduce their body condition enough not to complete their pregnancy and give birth to a healthy calf. If food resources are limited, breeding females may not produce one breeding every two years as is the normal reproductive cycle	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			of gray whales12 .In addition, the latest abundance studies reveal that the gray whale population shows a rapid decrease of approximately 24%, between 2016 and 2020, even without taking into account the mortality rates of the last two years13, 14. Recently, dated September 2022 it was published the NOAA Technical Memorandum on Abundance and Migratory Phenology of Eastern North Pacific Gray Whales 2021/202215. Thisreport about research if abundance carried out between 28 December 2021 and 18 February 2022 revealed that the estimated total abundance of gray whales during the 2021/2022 southbound migration was 16,650, which represents a decline and the 19.6% decline in abundance that occurred between 2020 and 2022.It meansthat only in two years the population declined almost 20%. But comparing to the whale population in 2016 (26,960) it has been a decline of 38% (Graphic 2). [see letter for graphic] Considering the 23.7% decline in abundance from 2016 to 2020 (Stewart and Weller 2021a), a continued decrease in the numbers of ENP gray whales has occurred since 2016: 26,960 whales in 2016, 20,580 in 2020 and 16,650 in 2022 (Fig. 2). The most recent estimate of 16,650 in 2021/2022 is comparable to those from 2000/2001 and 2001/2002 According to authors that gray whales population has been resilient over the years, but this time the continuing decline year after year between 2016 and 2022 “represents a pattern that requires further regular monitoring to determine when the population trajectory levels off and, in turn, again becomes positive”. In other words there is scientific uncertainty, which leads to precautionary principle, at least. In the same way the study on calf production 1994-202216 shows that the estimate of total calf production for 2022 was 216.7, which is the lowest estimate since the survey study started in 1994. In the same way it is similar to the period of Unusual	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Mortality Event (UME) 1999-2000, with declines of the population and the consequent periods of low calf production, but again recommends the following up of the process. (Graphic 3). [see letter for graphic] The above data allow us to affirm that the gray whale is going through a critical period that is not yet well known, that it is still in process, possibly multifactorial and evidently systemic, but that what is needed are measures that tend to facilitate the recovery of the population, and not aggravate the threats and risks already existing for its survival. Hunting, that is, the extraction of individuals from its population, cannot be an option. The ecosystem approach then indicates maintaining or restoring the composition, structure, function and provision of services of natural ecosystems with the aim of achieving sustainability. Scientific findings both in mexican lagoons and global counts on abundance and migratory phenology are consistent. There is a great decline in the population of gray whales that has fallen down from 26,960 whalesin 2016, to 16,650 in 2022, the strandings continue so far, after 4 years, the “poor body condition” is still in almost 20% of single whales for this 2022, and the number of calves is the lowest ever counted. These facts cannot be ignored by NMFS, and it must be recognized that this UME is somewhat different from the one of 1999-2000. It has been larger and with highest cost for gray whales. No serious scientific findings permit to make predictions. There is again scientific uncertainty. Therefore “Current and future levels of marine mammal species and populations “must take in account these facts of a declining and sick population. --- 7. 			· The existing obligations of international treaties and agreements of the United StatesIn this regard, we note that the DEIS and also the recommendation of Judge Jordan only take into account matters relating to the International Whaling Commission, which is essential, but it is not the only international treaty that should be considered in this particular decision-making. The United States of America has been a signatory to the United Nations (UN) since October 1945, one of the main objectives being leadership and collaboration on the issue of Human Rights, and the Charter of the United Nations. This Charter establishes that the obligations arising from it are above the obligations of the rest of the treaties (art.103).	Section 1.2 describes the legal framework applicable to this request.
			· Marine Ecosystem and the Right to a Healthy Environment In this regard, we must highlight that in April 2022, the United Nations Human Rights Council declared access to a "clean, healthy and sustainable environment" as a universal human right. Recognizing that sustainable development, in its three dimensions, and the protection of the environment, including ecosystems, contribute to and promote human well-being and the full enjoyment of all human rights, for present and future generations17 In accordance with the above, on July 28 of this year, with 161 votes in favor, including the United States (and 8 abstentions18) the Member States	Section 1.2 describes the legal framework applicable to this request. Chapter 4 describes the impacts of the alternative on the environment.

			of the General Assembly adopted Resolution A/76/L.75 which recognizes asfundamental "The human right to a clean, healthy and sustainable environment" as a universal right19 It was recognized that climate change and environmental degradation represent the most urgent threats to the future of human beings, so this Resolution asked Member States to redouble their efforts to ensure that all people on the planet have access to a "clean, healthy and sustainable environment." It also recognizes that the impact of climate change, the unsustainable management and use of natural resources, the pollution of air, land and water, the unsound management of chemicals and waste, and the resulting loss in biodiversity interfere with the enjoyment of this right - and that environmental damage has negative implications, both direct and indirect, for the effective enjoyment of all human rights20. This Resolution: 1. “Recognizes the right to a clean, healthy and sustainable environment as a human right; 2. Notes that the right to a clean, healthy and sustainable environment is related to other rights and current international law; 3. Affirms that the promotion of the human right to a clean, healthy and sustainable environment requires the full implementation of multilateral environmental agreements in accordance with the principles of international environmental law; 4. Urges States, international organizations, companies and other relevant stakeholders to adopt policies, increase international cooperation, strengthen capacity-building and continue to share good practices in order to intensify efforts to ensure a clean, healthy and sustainable environment for all”.

			Universal Human Rights are inherent in all of us, regardless of nationality, gender, ethnic or national origin, color, religion, language or any other condition. They range from the most fundamental - the right to life - to those that value our lives,such asthe rightsto food, education, work, health and freedom. The principle of universality of human rights is the cornerstone of international human rights law. This means that we all have the same right to enjoy human rights. Human rights are inalienable. They should not be deleted, except for specific situations and in accordance with an appropriate procedure. For example, the right to freedom can be restricted if a person is found guilty of a crime by a court of law. All human rights are indivisible and interdependent. This means that a set of rights cannot be fully enjoyed without the others. For example, advancing civil and political rights facilitates the exercise of economic, social and cultural rights. Similarly, the violation of economic, social and cultural rights can negatively result in many other rights. This issue is relevant, since the Makah tribe invokes its traditional and cultural rights to justify their intention to hunt whales again after more than a hundred years of not doing so. But no only the Makah Tribe. The Administrative Law Judge George J. Jordan in his Recommended Decision dated September 2021, establishes: “The Makah Tribe argues that whaling has significant cultural, spiritual, and historical significance, as evidenced by the whaling rights the Makah Tribe secured in the Treaty of Neah Bay. Makah whaling includes a constellation of practices including	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			ritual preparations and ceremonies, songs and dances, artistic representations, marriage practices, family titles, place names, potlatches and feasts, oral histories, authority and governance, and trade, among others. The Makah Tribe argues that its voluntary cessation of whaling in the early 20th century was always intended to be temporary, and did not affect their relationship with whales and whaling". (p. 72). "How central is whaling to Makah Tribal identity? Does the Tribe have a continuing traditional dependence? The Makah Tribe presented unrebutted evidence on the centrality of whaling to tribal identity"(p.25) "Is it possible for the Makah Tribe to substitute other, non lethal activities and maintain their traditional ties to whaling? The Makah Tribe presented convincing evidence that hunting and consuming whalesis an integral part of their culture" In the same way NMFS states that "Alternative 7, like the other action alternatives, would be consistent with the Makah stated need for the whale hunt, which is to allow the Tribe to exercise its trate whale hunting rights to provide a traditional subsistence resource to the community and to sustain and revitalize the ceremonial, cultural, and social aspects of its whale hunting traditions". (p. 94) 21. (p. 25) Said so, the Makah Tribe, NMFS, and Judge Jordan all together identify the Makah whaling as a cultural, traditional issue. Having said this we can say that although it is stated that the MMPA does not take into account cultural aspects, which is true, the authorities involved in the administrative process identify the Makah hunt with a cultural practice as one and the same thing. It could not be understood in any other way.	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Cultural rights are internationally recognized, as the right that every person has in the cultural life of his community. The right invoked by the Makah tribe is very generally part of Articles, 22 and 27 of the Universal Declaration of Human Rights22 Article 22. Everyone, as a member of society, has the right to social security, and to obtain, through national effort and international cooperation, taking into account the organization and resources of each State, the satisfaction of economic, social and cultural rights, indispensable to his dignity and the free development of his personality. Article 27. Everyone has the right to take a free part in the cultural life of the community, to enjoy the arts and to participate in scientific progress and the benefits that result from it. It must be said that, the Universal Declaration on Cultural Diversity of UNESCO recognizes as culture "*the set of the distinctive spiritual and material, intellectual and affective traits that characterize a society or a social group and that encompasses, in addition to the arts and letters, the ways of life, the ways of living together, the systems of values, traditions and beliefs*." 23 It is then that when it refers to traditions, beliefs, and values, such as the case of the Makah, they are framed in cultural rights as protected and delimited by the Universal Declaration on Cultural Diversity, referred to above. It clearly establishes that every person must be able to participate in the cultural life of their choice and exercise their own cultural practices, within	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			the limits imposed by respect for human rights and fundamental freedoms. Article 5 ... Every person has the right to a quality education and training that fully respects his cultural identity; every person must have the possibility to participate in the cultural life he chooses and conform to the practices of his own culture, within the limits imposed by respect for human rights and fundamental freedoms. According to the provisions of article 17 , cultural rights cannot be seen in isolation from other human rights recognized by international law. This is stated in Article 17 of that declaration: "The right of every person to participate in cultural life is closely linked to the enjoyment of other rights recognized in international human rights instruments. Therefore, the States Parties are obliged to comply with the obligations imposed on them by Article 15, paragraph 1 (a), as well asthose stipulated in the other provisions of the Covenant and the international instruments, in order to promote and protect all the variety of human rights guaranteed by international law." Moreover, it establishes that states must ensure, promote and protect all human rights and fundamental freedoms. However, it clearly establishes that cultural rights cannot be invoked to violate the human rights guaranteed by international law, or their scope can not be limited; as established in Article 18: . .. “although it is necessary to take into account national and regional particularities and the various historical, cultural and religious environments, States, whatever their political, economic or cultural systems, have the obligation to promote and protect all human rights and fundamental freedoms. Therefore, no one can invoke cultural diversity to	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			violate the human rights guaranteed by international law or to limit their scope." And Article 19 has a greater scope when it comes to conducts that are negative or that violate other human rights: "In some circumstances it may be necessary to impose limitations on the right of everyone to participate in cultural life, especially in the case of negative practices, including those attributed to custom and tradition, which violate other human rights",...24 (such as the right for a healthy and clean environment). That is, cultural rights have limitations that have to do with the common good and the other human rights. These limitations must pursue a legitimate purpose, be compatible with the nature of that right and be strictly necessary for the promotion of the general welfare of a democratic society. In so Article 15, paragraph 1 (a), cannot be interpreted as meaning that a State, group or individual has the right to undertake activities or perform acts aimed at the destruction of the rights or freedoms recognized in the Covenant or their limitation to a greater extent than that provided for in it 25 The tradition and customs of the Makah tribe are framed in the concept of culture and that UNESCO defines 26 as "the total sum of the material and spiritual activities and products of a certain social group that distinguishes it from other similar groups, and a system of values and symbols, as well as a set of practices that a specific cultural group reproduces over time and that gives individuals the symbols and meanings necessary to act and relate socially throughout life"	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			The Makah Tribe invokes its ancient cultural and traditional right to hunt whales. However, ancestral traditions and cultures evolve in time and do not constitute an abstract and immobile concept in time but are built and reconstructed from the social interaction between the members of the group and with the external society, as well as a response to environmental and technological changes in the evolution of time. Cultural traditions are active, dynamic and adaptive. In this regard, UNESCO itself establishes that culture acquires different forms through time and space, so the evolution and dynamism of cultures and different groups is recognized, with different originality and plurality, in coexistence. In this intercultural network, human rights coexist and govern, in a dynamic and congruent way. The United States of America has been a signatory of the International Convention on Economic, Social and Cultural Rights since 197727 to which I refer in this document. Therefore, despite not being binding, it does forcefully guide the actions to be followed in order to prevent the erroneous interpretation of the cultural rights of any person or group from being contrary to fundamental human rights, in this case the right to a healthy environment. In other words, actions must be focused on this purpose. Therefore, whaling under the argument that two or three whales per year is sustainable, loses argumentative strength and sense in the face of an scenario of a decimated and sick population that is suffering a very important ecological stress throughout its migration route. From the feeding grounds that show a serious decrease in their biomass and whose cause may be the effects of climate change.	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			But also recent studies that show that this decrease is related to the commercial whaling that was suspended just a few decades ago and caused the loss of millions of whales, including the gray whale hunt that reached only about 2,000 individuals, which lost the largest source of pollination and fertilization in the northern seas. Everything is interconnected and it cannot be ignored that the whaling that took place in the past two centuries has harmful effects not only in the short term, but also in the medium term as we are seeing now28. In this situation, each individual counts and is valuable for its ecosystem. The state of health of the gray whales of the Pacific and their high mortality are not oblivious or independent of the state of health of the marine ecosystem, nor from the human, past and present actions that can influence to mitigate or aggravate the impacts that the species is currently suffering. The health of gray whales is drawing our attention to an altered and sick ecosystem. The concept of One Health, developed in the last 20 years and currently adopted by international organizations (WHO, FAO, OIE) emphasizes the close interrelationship between all elements of ecosystems, which includes the human being. The appropriate solution to the serious problem faced by the gray whale must be made from the perspective of One Health, without a doubt. It is necessary to adopt scientific advances, recognize the profound interrelationship of our actions and the ecological imbalance in marine systems in general and the facts found and described in this opinion as well as in other opinions issued by non-governmental organizations in favor of the gray whale.	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			The Human Right to a healthy environment necessarily goes through the precautionary measures of not doing more damage and favoring the recovery of gray whales. To this end, the Kunming Declaration of the Convention on Biological Diversity established, on October 13, 2021, the need to build an ecological civilization that guarantees a shared future for all life on Earth, where respect and care for other animals and nature are learned from childhood. Today it is proposed to "lead biological diversity towards recovery," as a decisive and urgent challenge. --- 17. https://www.ohchr.org/en/statements-and-speeches/2022/04/right-healthy-environment#:~:text=Human%20Rights%20Council%20resolution%2048,at%20the%20UN%20General%20Assembl 18. 			Therefore, and in view of the arguments presented, the reasoning that must be followed is in the sense that the hunting of whales would result in an unpredictable way that will aggravate the precarious situation of whales and the ecosystem on which whales and humans depend. It is a situation where the cultural rights that have been invoked are opposed and contrary to the right to a healthy environment; therefore contrary to International Human Rights Law. Consequently, there is a great concern about the possibility of the NMFS authorizing the hunting of gray whales, in contravention of the main objective of the Act for the Protection of Marine Mammals (MMPA), which is to maintain the health and stability of the marine ecosystem and the Right to a Healthy Environment. It is also contrary to the legitimate rights of fishermen in Baja California Sur who depend economically on the sighting of gray whales every season, legally regulated. Therefore, respectfully but firmly we manifest that the Exception (waiver) for hunting gray whales for the Makah tribe should not be approved.	We note this closing information.
485	AWI	10/14/22	On behalf of the Animal Welfare Institute (AWI), I submit the following comments on the Supplemental Draft Environmental Impact Statement on the Makah Tribe Request to Hunt Gray Whales (SDEIS), which purports to analyze additional information relevant to the Makah Tribe's request for a waiver of the Marine Mammal Protection Act's (MMPA) take moratorium to conduct ceremonial hunts. 87 Fed. Reg. 39,804 (July 5, 2022). The SDEIS relied on outdated data, failed to consider a number of viable alternatives, and the process by which it was produced deprived outside experts and other interested parties of the opportunity to fully analyze and address the new data made available at the tail end of the process.1	We note the comments raised in this introduction and provide responses to the points as they are raised in the body of the comment letter.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			On February 27, 2020, the National Marine Fisheries Service (NMFS) published a Notice of Intent to prepare the SDEIS, noting that the analysis would include, among other things, information about the ongoing gray whale Unusual Mortality Event (UME). 85 Fed. Reg. 11,347, 11,348 (Feb. 27, 2020). However, the SDEIS did not provide any meaningful analysis of the UME. To the contrary, the SDEIS's glaring deficiencies, including NMFS's failure to timely disclose critical information, prevented both the agency and interested stakeholders from fully reviewing and assessing the environmental impacts of the proposed action and its alternatives. Consequently, the SDEIS violates the National Environmental Policy Act (NEPA), 42 U.S.C. §§ 4321-4370m, and its implementing regulations, as well as the Administrative Procedure Act (APA), 5 U.S.C. § 706(2).2 As discussed below, as well as in various comments submitted as part of the MMPA and NEPA processes, NMFS's proposed waiver and regulations eschew the conservative, precautionary approach that the MMPA demands and, instead, prioritize the interests of the Tribe over marine mammals. Grey whales are facing ongoing and increasing threats, including from ship strikes, bycatch, contaminants, ocean noise, and ocean warming, including localized and regional marine heatwaves. NMFS itself recognizes the precarious situation facing each recognized subpopulation. Indeed, the Western North Pacific (WNP) gray whales remain listed as endangered under the Endangered Species Act (ESA). The ENP gray whale and Pacific Coast Feeding Group (PCFG) gray whale populations continue to suffer steep declines in abundance and calf recruitment due to the multiyear, ongoing UME, the cause of which remains unknown. Additionally, questions remain regarding the appropriate designation of the PCFG gray whale management unit under the MMPA. Unfortunately, NMFS's flawed, results-oriented decision-making in this matter has carried	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			through to the NEPA process, resulting in an SDEIS that ignores important data and violates NEPA's requirements in several crucial respects. Accordingly, the SDEIS is arbitrary, capricious, and not in accordance with law. These flaws must be corrected before any final decision can be issued. As it did in its comments on the Recommended Decision, AWI again feels compelled to point out its strong organizational commitment and dedication to environmental justice and civil rights matters generally and Native sovereignty issues specifically. While AWI fully appreciates the Tribe's unique cultural heritage and its interest in hunting gray whales, at this time AWI does not view such a hunt as consistent with the best available science regarding the various gray whale populations that could be affected by the proposed hunt, nor the precautionary principle embodied in the MMPA. Nor does AWI view the SDEIS process as taking the legally required "hard look" at the impacts of the proposed hunt or its alternatives, as required by NEPA. Accordingly, AWI submits these comments through a law- and science-focused lens that is in no way intended to demean or diminish the Tribe's interests in engaging in important cultural practices. --- 1 AWI incorporates by reference its comments on the Recommended Decision, as well as comments submitted on the 2015 Draft EIS, and declarations and briefs submitted during the MMPA waiver process. 2 In 2020, the Trump Administration issued sweeping changes to NEPA's implementing regulations that apply only to NEPA processes "begun after the effective date" of September 14, 2020. 85 Fed. Reg. 43,304, 43,339 (July 16, 2020). The SDEIS was prepared pursuant to the NEPA regulations in place at the time of NMFS's 2015 Draft EIS (DEIS) for the

			proposed hunt. See SDEIS at iv. Accordingly, the citations to NEPA regulations in this comment letter likewise refer to the NEPA regulations in place prior to the 2020 Final Rule.On behalf of the Animal Welfare Institute (AWI), I submit the following comments on the	
			STATUTORY BACKGROUND3 Congress enacted NEPA more than four decades ago "[t]o declare a national policy which will encourage productive and enjoyable harmony between man and his environment; to promote efforts which will prevent or eliminate damage to the environment." 42 U.S.C. § 4321. In light of this mandate, the Supreme Court has reasoned that NEPA is "intended to reduce or eliminate environmental damage and to promote 'the understanding of the ecological systems and natural resources important to' the United States." Dep't of Transp. v. Pub. Citizen, 541 U.S. 752, 756 (2004) (quoting 42 U.S.C. § 4321).To achieve NEPA's substantive goals, Congress created two specific mechanisms whereby federal agencies must evaluate the environmental and related impacts of a particular federal action—an Environmental Assessment (EA) and an EIS. See 42 U.S.C. § 4332(c). These procedural mechanisms are designed to inject environmental considerations "in the agency decision-making process itself," and to "help public officials make decisions that are based on understanding of environmental consequences, and take actions that protect, restore, and enhance the environment." Pub. Citizen, 541 U.S. at 768-69 (quoting 40 C.F.R. § 1500.1(c)). Therefore, "NEPA's core focus [is] on improving agency decision-making," Id. at 769 n.2, and specifically on ensuring that agencies take a "hard look" at potential environmental impacts and environmentally enhancing alternatives "as part of the agency's process of deciding whether to pursue a particular federal action." Balt. Gas & Elec. Co. v. NRDC, 462 U.S. 87, 100 (1983).The alternatives analysis "is the heart" of an EIS or EA. 40 C.F.R. § 1502.14. NEPA's	This background information is noted.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			implementing regulations require that the decision-making agency "present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decision-maker and the public." Id. To assist in NEPA's twin aims of ensuring that agencies "consider every significant aspect of the environmental impact of a proposed action" and "inform the public that it has indeed considered environmental concerns in its decision-making process," id., an EIS must "provide full and fair discussion of significant environmental impacts" and must "inform decision-makers and the public of the reasonable alternatives which would avoid or minimize adverse impacts or enhance the quality of the human environment." Id. § 1502.1. Importantly, the NEPA process "shall serve as the means of assessing the environmental impact of proposed agency actions, rather than justifying decisions already made." 40 C.F.R. § 1502.2(g) (emphasis added); see also id. § 1502.5 (requiring that NEPA review "shall be prepared early enough s*o that it can serve practically as an important contribution to the decision-making process and will not be used to rationalize or justify decisions already made"* (emphases added)). --- 3. In light of the extensive comments AWI has submitted at various stages of this decision-making process, AWI feels it unnecessary to discuss the factual background in depth. Additional relevant facts are incorporated into the discussion throughout.	
			DISCUSSION **A. The SDEIS Process Suffered from Procedural Irregularities That Deprived <u>Commenters of Timely Access to Critical Information</u>** Although AWI appreciates NMFS's initial grant of a 60-day extension of the comment deadline, 87 Fed. Reg. 50319 (Aug. 16, 2022), the agency's subsequent denial of an additional extension to review newly released	See Appendix C Responses to Frequent and Substantive Comments #16-Amount of time allowed to comment on the DEIS Harris et al. (2022) was "in press" when the SDEIS was released and is cited as such throughout the SDEIS. As soon as Harris et al. (2022) and Eguchi et

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			materials bearing directly on the issues of gray whale abundance and the impacts of the UME is particularly troubling. Shortly before the comment deadline, NMFS published several papers that contain information vital to an accurate assessment of the proposed hunt and its environmental impacts. For example, one paper contained a revised abundance estimate for PCFG gray whales, see Harris et al. (2022),4 while other papers contained a revised gray whale population abundance estimate and new gray whale calf recruitment numbers, see Eguchi et al. (2022).5 Despite the belated release of these studies that NMFS knew were in the process of being finalized during the SDEIS process—indeed, reports concerning the revised ENP gray whale abundance estimates and calf production were posted on NMFS's website a mere seven days before the SDEIS comment deadline—NMFS denied AWI's request for a second, limited extension to allow it time to review and incorporate the new data into its comments. As a result, AWI's ability—and indeed, that of all stakeholders—to review and address the reports was compromised. NMFS's decision is particularly troubling given the fact that these reports document an ongoing, dramatic decline in ENP gray whale abundance estimates, as well as the lowest number of northbound gray whale calves since counts were initiated in 1994. Such information is directly relevant to the subject matter and analysis contained in the SDEIS. Yet, AWI and other stakeholders were denied sufficient opportunity to review and incorporate the data into their comments. NMFS's failure to provide timely access to the reports is likewise troubling because NMFS issued its SDEIS a mere three months before the updated gray whale abundance report was finalized. See 87 Fed. Reg. 39804; Harris et al. (2022). Rather than wait to ensure that the SDEIS contained the most accurate and updated information available—which NMFS knew was "in prep[aration]" and would be finalized shortly—NMFS once again barreled	al (2022) were published, we made them available to the public. These papers were available during the initial comment period and when it was reopened on October 25, 2022.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			ahead and issued its SDEIS based on outdated information, compromising the integrity and accuracy of the decisionmaking process. The agency's failure to disclose such information that goes to the very heart of the decision under review—i.e., whether to waive the MMPA's moratorium and allow a hunt for individuals of the declining ENP gray whale population—deprived interested stakeholders of a sufficient opportunity to review, analyze, and incorporate highly relevant information into their substantive comments. This lack of transparency violates the information disclosure requirements of NEPA and is a major flaw with the SDEIS. --- 4 J. Harris et al., NOAA Fisheries, Recent Trends in the Abundance of Seasonal Gray Whales (Eschrichtius robustus) in the Pacific Northwest, 1996-2020, AFSC Processed Rep. 2022-05 (Sept. 2022). 5 Tomoharu Eguchi et al., NOAA Fisheries, Abundance and Migratory Phenology of Eastern North Pacific Gray Whales 2021/2022, NOAA Technical Memorandum NMFS-SWFC-668 (Sept. 2022).	
			B. The SDEIS is Woefully Inadequate and Fails to Satisfy the Requirements of NEPA.NEPA requires agencies to ensure that the information they use is "of high quality." 40 C.F.R. § 1500.1(b). Indeed, "[a]ccurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA." Id. The SDEIS fails to meet this requirement.First, despite the fact that two of the SDEIS's preparers were also named authors of the paper reporting the revised ENP gray whale abundance estimates—which again, was not only in the process of being finalized while the SDEIS was being prepared but was released a mere seven days before the SDEIS comment deadline—NMFS inexplicably elected to rely on outdated 2020 abundance estimates in the SDEIS, skewing its analysis. Since 2016, the ENP gray whale population has declined by 38%, and calf production last year was at its lowest since	We disagree. The information included in the NEPA documents is of high quality and accurate. Subsequent to the publication of the SDEIS, new scientific papers were published. These papers were made available to the public during the comment period. The papers and the comments received on them are considered in the FEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			scientists began counting births in 1994. The 2022 abundance estimate now sits at a mere 16,650 whales. Not only is this nearly 4,000 fewer whales than the population estimate relied upon in the SDEIS's analysis, it is also below the abundance estimate when gray whales were delisted under the ESA (i.e., 20,000-21,000 whales). 58 Fed. Reg. 3121, 3125 (January 7, 1993). Given the low calf production, this decline is likely to continue. The PCFG gray whale population has likewise experienced an 18% decline from an estimated high of 257 in 2015 to 212 in 2020 (the most recent year for which a PCFG abundance estimate is available). Although the SDEIS briefly discussed the impacts of setting a "low abundance trigger" on the hunt—i.e., an abundance estimate below which the hunt would not occur—NMFS did not meaningfully examine the impacts of conducting a hunt on a population that is undergoing a dramatic decline. For example, although NMFS dismissed the impacts of non-lethal approaches or strike attempts on individual whales as being "temporary," NMFS did not take a hard look at how those takes will impact whales, both individually and cumulatively with other stressors, including declining food availability, climate change, and whether lethal or non-lethal, it is likely that such takes will have a serious adverse impact on malnourished or otherwise compromised individuals.6 Yet, NMFS never examined such effects. Because the SDEIS relied on outdated data despite the availability of updated data that bear directly on the environmental consequences of the action, and further, because the reliance on outdated data skewed the agency's analysis and masked adverse impacts, the SDEIS violates NEPA and its implementing regulations.	
			Relatedly, NMFS failed to examine the impacts of the hunt relative to PBR in light of the revised abundance estimates and negative population trend data. PBR is intended to determine the maximum number of animals that can be removed from a population or stock as a result of human-caused mortalities (not natural mortalities) while allowing the population or stock	With respect to the consideration of PBR, we considered alternative values for the recovery factors and Rmax, calculating an "informational" PBR for ENP gray whales (see FEIS Subsection 3.4.3.3.4) .

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			to reach or maintain its optimum sustainable population (OSP). SDEIS at v. Given the precipitous decline in the ENP and PCFG gray whale populations, NMFS must revisit the other variables used in the calculation of PBR, including Rmax and the recovery factor, to determine whether the variables must also be revised. 7 Indeed, for declining populations, the precautionary principle dictates that a more conservative Rmax be used to ensure that human-caused mortalities are not contributing to a population's failure to maintain OSP. Likewise, where a population is in danger of falling below OSP, the recovery factor of 1.0 may not be appropriate. Determining an accurate and biologically justifiable PBR is essential to achieving the MMPA's purposes, and is especially critical where, as here, evidence suggests an increase in human-caused mortalities in a population as a result of, for example, ship strikes,8 bycatch,9 and ongoing subsistence harvest.10 NMFS must rigorously examine the direct, indirect, and cumulative impacts of the proposed hunt, including all of the best available data regarding population trends, sources of human-caused mortality, and the impacts of climate change on gray whales. NMFS's failure to conduct such a robust analysis, either in the DEIS or the SDEIS, violates NEPA's hard look requirement.	See also Appendix C Responses to Frequent and Substantive Comments #7-Calculation and use of 'potential biological removal' (PBR) for a PCFG mortality limit.
			Second, the SDEIS failed to fully examine the impacts of the UME on the ENP and PCFG gray whale populations. Although the causes of the UME have not yet been determined, available evidence suggests that the increased mortality of gray whales is due in part to decreased food availability in the Arctic, which in turn is linked to climate change. The SDEIS dismisses the UME as merely a population fluctuation typical of a boom/bust cycle, but the year-over-year decline in abundance since 2016 is strongly suggestive of a larger trend. NMFS failed to examine this potential. Instead, NMFS remained myopically focused on dismissing the impacts of the proposed hunt, insisting that its cursory assessment of "low-impact triggers" for ENP and PCFG gray whales suffices for an	With respect to the ongoing UME and the decline in population, we have updated the FEIS throughout. See also Appendix C Responses to Frequent and Substantive Comments #19--Ongoing UME.The NEPA documents examine the effects of the action on whales, both individually and cumulatively, in the context of the recent decline. See, among others, Sections 4.4 and 5.4 of the FEIS. See also Appendix C Responses to Frequent and Substantive Comments #10-Response of gray whales to being hunted.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			examination of the actual impacts of the proposed hunt on a declining population. In so doing, NMFS ignored an important aspect of the problem, and failed to take the requisite hard look at the effects of its action. NMFS must take a hard look at the impacts of the proposed hunt and its alternatives—direct, indirect, and cumulative—in light of the long-term impacts of the UME and its causes on gray whale abundance.Third, the SDEIS failed to fully examine the direct, indirect, and cumulative impacts of take on ENP, PCFG, and WNP whales. The SDEIS suffers from the same fatal flaw as the Recommended Decision, i.e., it presumes without evidence that the effect of takes by approach or pursuit will have only a temporary effect on WNP whales. However, as previously explained in AWI's comments on the Recommended Decision, vessel approaches to within 100 yards are known to have the potential to cause behavioral disturbances and thus have long been formally considered by NMFS to constitute harassment. Moreover, at the administrative hearing, when asked to describe gray whales' reaction to being approached by research vessels, Dr. Weller admitted not only that many whales do in fact react, but that such reaction "is often related to the behavior of the boat and how it is operated." Tab 102, 10:10-14. Thus, it stands to reason that a gray whale that has been targeted by Tribal hunters and subjected to an approach and pursuit in a hunt scenario may react quite strongly. As a result, NMFS's SDEIS failed to take a hard look at this critical aspect of the proposed hunt, and as such violates NEPA, its implementing regulations, and the APA.	
			NMFS's failure to take a hard look at the impacts of take on gray whales is particularly egregious with respect to the endangered WNP gray whale. The SDEIS erroneously focuses only on the potential of a WNP whale being lethally struck. However, as explained, even so-called "temporary" disturbances can have serious adverse impacts on whales, including energy expenditures, disruption or abandonment of important life history behaviors, and stress, all of which could impact the long-term viability of	Villegas-Amtmann et al. (2015) and Villegas-Amtmann et al. (2017) are considered in the FEIS. These papers develop a conceptual framework for understanding how disturbance can potentially translate into energetic consequences to marine mammals and apply this model to gray whales. These energetic consequences can potentially lead

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			individuals and even the stock itself. Indeed, Villegas-Amtmann et al. (2017) (Attach. 2) used a female bioenergetics model to predict the consequences of energetic loss in WNP female gray whales. Considering the longer migration distance for WNP gray whales either to Mexico or China, they found that the energy requirements for WNP female gray whales were generally 11-15% higher than those of female ENP gray whales. The modeling output predicted that female WNP "mortality would likely occur at 38-40% annual energetic loss" and that "[l]ong-term yearly energy loss of 30% would result in adult female mortality the first year, followed by lower reproductive rates of survivors." NMFS's SDEIS fails to meaningfully discuss gray whale bioenergetics or analyze the direct, indirect, or cumulative impacts of sub-lethal take on WNP gray whale individuals or on the stock as a whole, thereby minimizing the potential adverse effects of the proposed hunt on the endangered species. As a result, the SDEIS violates NEPA, its implementing regulations, the MMPA, and the APA. Finally, the SDEIS failed to examine all reasonable alternatives. Specifically, the SDEIS failed to examine the mid-range alternative of conducting a hunt without authorizing any training activities. This alternative would accomplish the purpose and need for the action while also reducing the adverse effects on ENP, PCFG, and WNP gray whales and the marine environment. Yet, NMFS never examined such an alternative either in the DEIS or in the SDEIS. "The existence of a viable but u nexamined alternative renders an [EIS] inadequate." Westlands Water Dist. v. U.S. Dep't of Interior, 376 F.3d 853, 868 (9th Cir. 2004) (quotation omitted). It is particularly troubling here that NMFS failed to consider any alternatives that "might meet the goals of the agency by using different approaches which may reduce the environmental impacts of the agency's action." Soda	demographic consequences. Certain activities (e.g., approaches, training harpoon throw) may translate into the whale behaving in a particular way (e.g., moving to a new feeding area, increased swimming speed). The response will vary based on the individual and their behavior (e.g., migrating, feeding) at the time of the activity. In addition, the whale may compensate for these impacts (e.g., by moving to another feeding area). While we do not know how a particular response translates into energy loss, the impacts from non-lethal hunt activities would be short-term in nature and would likely be recovered from (for example, see section 4.4.2.4 Change in Numbers of Gray Whales Using the Makah U&A and OR-SVI Areas). They are unlikely to result in long-term impacts to individuals or the population.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Mountain Wilderness Council v. Norton, 424 F. Supp. 2d 1241, 1265 (E.D. Cal. 2006).	
			Notably, to our knowledge no other subsistence whale hunt permits "training activities." It is unclear why NMFS has incorporated such training activities into its proposed activity, particularly given the serious adverse impacts of such activities on the affected whales and their constituent stocks. Yet, NMFS never analyzed, either in the DEIS or in the SDEIS, an alternative that would forbid such training activities and allow only the core proposed action, i.e., the hunt. NEPA imposed a clear-cut procedural obligation on NMFS to take a "hard look" at alternatives that would entail less significant impacts on resources affected by the project. Balt. Gas, 462 U.S. at 100. An EIS must "[r]igorously explore and objectively evaluate all reasonable alternatives" and, in particular, "should present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decision-maker and the public." 40 C.F.R. § 1502.14. NMFS's objectives must take into account "the views of Congress, expressed . . . in the agency's statutory authorization to act." Citizens Against Burlington, Inc., 938 F.2d at 196; see also Theodore Roosevelt Conservation P'ship, 661 F.3d at 72 (defining "reasonable alternative" to mean one that "is objectively feasible as well as 'reasonable in light of [the agency's] objectives'" (alterations in original) (quoting City of Alexandria v. Slater, 198 F.3d 862, 867 (D.C. Cir. 1999))). With respect to marine mammals, Congress mandated that the management of populations be carried out with the interests of the animals as the prime consideration. H.R. REP. NO. 92-707, at 18, 1972 U.C.C.C.A.N. at 4145 (emphasis added). Accordingly, a reasonable range of alternatives must include alternatives that have fewer adverse effects on gray whales. Legally and logically, this includes a mid-range alternative that prohibits	With respect to the consideration of an alternative that does not include authorization of training activities, see Appendix D Responses to Frequent and Substantive Comments #22-Authorization of Training ActivitiesWe have incorporated Sato and Wiles (2021) into the FEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			training activities. NMFS's failure to examine such an alternative and its impacts violates NEPA, its implementing regulations, and the APA. Cf. Union Neighbors United, Inc. v. Jewell, 831 F.3d 564, 577 (D.C. Cir. 2016) ("Accordingly, because the Service in these circumstances did not consider any other reasonable alternative that would have taken fewer Indiana bats than Buckeye's plan, it failed to consider a reasonable range of alternatives and violated its obligation under NEPA.").	
			---------- 6. Villegas-Amtmann et al. (2015) (Attach. 1), for example, used a bioenergetics model to determine the energy requirements for a two-year reproductive cycle for female gray whales and to predict the consequences of energetic losses under three possible disturbance scenarios. The authors determined that an annual energetic loss of only 4% would prevent a successful gray whale pregnancy. During the birth year, a pregnant gray whales would wean her calf at a lower mass if she experienced a 37% energetic loss. If an adult female gray whale experiences a 30-35% energetic loss, she would lack the energy to become pregnant. Moreover, a 40-42% energetic loss would likely be fatal. 7. For example, although the previous PBR calculation for ENP gray whales used an Rmax value of 6.2, the currentprecipitous decline in calf production numbers merit a reevaluation of that value. 8. The impact of ship strikes on gray whale may be greater than previously considered. As noted in the SDEIS, "a recent qualitative assessment of the co-occurrence of North Pacific gray whales and vessel traffic found that ship strikes, and related underwater noise may pose a significant risk to gray whales." SDEIS at 39. Recent studies have determined that certain areas present a "high risk" of ship strikes and underwater noise, including the Russian Far East (Kamchatka	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			peninsula and Okhotsk Sea), Bering Sea, Gulf of Alaska, and along the entire west coast of North America. Id. "The study estimated that the number of gray whales killed annually rangewide may be in the tens or perhaps low hundreds, and the risk was greatest during gray whale migration periods when animals are near shore and overlap with coastal shipping routes and fisheries." Id. This is particularly concerning where the 2020 Stock Assessment Report indicated that annual mortality from vessel strikes from 2014-2018 was only 1.8 whales. NMFS must account for the most recent data in human-caused mortality in its analysis of effects of the proposed hunt on gray whales.	
			9 According to the Washington Department of Fish and Wildlife, "[g]ray whales are especially vulnerable toentanglement because of their use of nearshore coastal waters, where fishing activity is often highest." Chris Sato &Gary J. Wiles, Wash. Dep't of Fish & Wildlife, Periodic Status Review for the Gray Whale 10 (Feb. 2021), available athttps://wdfw.wa.gov/sites/default/files/2021-02/gray_whale_psr_final_draft_fwc-ready.pdf. Indeed, "[f]rom 1982 to2018, gray whales were the most frequently entangled whale species along California, Oregon, and Washington,averaging 6.9 entanglement reports per year, although actual numbers of entanglements are likely much higher thanindicated by these reports." Id.10 According to gray whale kill data provided to the IWC, from 2019 through 2022, Russian indigenous whalers killedan average of 133.33 gray whales each year. See IWC, Aboriginal Subsistence Whaling Catches Since 1985,https://iwc.int/table_aboriginal.	
			CONCLUSION Although AWI appreciates NMFS's willingness to prepare a supplemental	These concluding comments are noted.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			EIS, AWI is extremely disappointed that NMFS is using this opportunity to once again sidestep important issues that matter to AWI, its members, and many American citizens. In doing so, NMFS is failing to follow its legal mandate to protect the marine life in its purview. The proposal to grant the first waiver under the MMPA is highly consequential and requires a rigorous examination of the impacts of the proposal and its alternatives to ensure that any activities authorized comply with the policies and purposes of the MMPA. Unfortunately, the SDEIS falls far short of offering such an analysis. AWI urges NMFS to reconsider the unduly narrow scope of its SDEIS, and to instead analyze all relevant issues that have been raised to the agency at the DEIS stage and in the parallel MMPA process.	
486	MMC	10/14/22	On 5 July 2022, the National Marine Fisheries Service (NMFS) published a notice in the Federal Register (87 Fed. Reg. 39804) requesting comments on a supplemental draft environmental impact statement (SDEIS) regarding the Makah Tribe's request to hunt eastern North Pacific gray whales. Due to its consultative role under section 103(a) of the Marine Mammal Protection Act (MMPA) and participation as a party to the rulemaking, the Marine Mammal Commission (Commission) has had numerous opportunities to comment on various aspects of the proposed waiver of the Act's moratorium on the taking of marine mammals to authorize the Makah Tribe to hunt gray whales and on the associated analyses under the National Environmental Policy Act (NEPA). As such, the Commission is limiting these comments to only a few aspects of the SDEIS and trusts that these comments will be read in conjunction with our previous comments on the waiver request, NMFS's proposed regulations, the Administrative Law Judge's recommended decision, and earlier NEPA documents.	We note this background information.
			Preferred Alternative and New Information The SDEIS introduces a new, seventh alternative that NMFS identifies as the preferred alternative. This alternative assembles elements from the	Comments noted.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			other six alternatives previously considered in the 2015 DEIS and reflects evolution of the proposed rule during the course of the rulemaking to authorize alternating winter/spring and summer/fall hunts. The Commission believes that this alternative best meets the objectives of the Makah Tribe in seeking authorization to hunt eastern North Pacific (ENP) gray whales, while appropriately apportioning the risks associated with the hunt between non-target, endangered gray whales from the western North Pacific (WNP) stock and the Pacific Coast feeding group (PCFG) of gray whales. As reflected in its 13 November 2021 comments on Judge Jordan's recommended decision, the Commission supports adoption of Alternative 7 subject to certain amendments and additional conditions. The SDEIS also updates the analyses of other alternatives reviewed in the 2015 DEIS to reflect new information on gray whale abundance and distribution that was not previously available. Most importantly, the SDEIS incorporates information concerning the unusual mortality event (UME) involving ENP gray whales declared by NMFS in May 2019. As noted in the SDEIS, as of 3 June 2022, 578 stranded gray whales had been reported across their range in Mexico, the United States, and Canada since 17 December 2018. An earlier die-off of gray whales occurred in 1999-2000 that similarly coincided with a more than 20 percent decline in ENP gray whale abundance.	
			ENP Gray Whale Population Abundance Threshold In his recommended decision, the Administrative Law Judge (ALJ) adopted the Commission's position that the regulations governing the hunting of gray whales should include a "population floor" below which hunting ENP gray whales would be suspended. Given the stock's history of UMEs, which are associated with rapid, significant declines in abundance, the Commission continues to believe that setting a floor is needed to comport with the MMPA's requirements and to prevent the hunt from adding to what	The purpose of the FEIS is to to analyze potential impacts of alternatives to inform decision-making. The impacts of the Preferred Alternative are analyzed without an ENP population abundance threshold. However, three thresholds are considered as Sub-alternatives. Under the Sub-alternatives, hunting would cease if the abundance estimate (N) of the ENP gray whale stock dropped below: a) N=11,000,

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			already would be a precipitous decline in abundance. Although supportive of setting a numeric floor in the regulations, the ALJ's recommended decision did not suggest what number would be appropriate.The SEIS includes three possible abundance thresholds below which hunting would cease: 11,000 whales, 16,000 whales, or 18,000 whales. Although there is some population floor below which hunting of ENP gray whales should be suspended due to conservation concerns, the Commission's argument is primarily a legal one. Section 103(a) of the MMPA requires that regulations issued thereunder be consistent with the purposes and policies set forth in section 2 of the Act and not be to the disadvantage of the affected species and stocks. The courts have interpreted these provisions as requiring NMFS to determine that the stock currently is within its optimum sustainable population (OSP) and will remain so despite the authorized taking, as preconditions to waiving the MMPA's taking moratorium. Thus, whatever population floor ultimately is adopted, it should have a clear relationship to the lower bound of the OSP range, the stock's maximum net productivity level (MNPL).The proposed threshold of 11,000 whales is clearly below the OSP range of ENP gray whales and should be rejected on that basis alone. Notwithstanding the fact that the stock has been able to "recover" from that number before, allowing taking under a waiver to persist once the population drops below its MNPL would be inconsistent with the requirements of section 103 and the broader purposes and policies of the Act.Arguments can be made in favor of either 18,000 or 16,000 whales as the appropriate threshold. As discussed in section 4.1.6.6 of the DEIS, a plausible case can be made that the MNPL of the ENP stock is approximately 16,000, given Punt and Wade's 2012 estimate of carrying capacity (K) and the theoretical relationship between MNPL and K for large whales of approximately 60 percent. MNPL would similarly be about 16,000 using the point-estimate of 26,960 in 2015/2016 as the stock's abundance prior to the onset of the 2019 UME, and assuming the stock was	b) N=16,000, or c) N=18,000. Should a waiver be granted, the Agency will condsider whether an abundance threshold for ENP whales is appropriate in acordance with the requirements of the MMPA. The MMC's legal arguments and comments related to abundance thresholds are noted.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			at K at that point and that MNPL is 60 percent of K. 1 Nevertheless, the Commission favors setting the hunting floor at a population level of 18,000 and recommends that this number be incorporated into the preferred alternative and the final regulations. It represents a more precautionary approach that takes into account uncertainty as to whether the population was in fact at K in 2016 (or any other year that might be used as the benchmark), uncertainty in the population estimates (by using the upper 95 percent confidence interval of the best—e.g., most recent—pre-UME abundance estimate as a measure of carrying capacity) and uncertainty about the ratio between K and MNPL, which could be greater than 60 percent. Moreover, erring on the side of the whales where uncertainty exists would be consistent with goals of the MMPA as interpreted in Committee for Humane Legislation v. Richardson, and with the mandate in section 103(a) that NMFS "*insure*" that the authorized taking will not be to the disadvantage of the stock (emphasis added). --- 1 Using the point estimate of abundance from 2014/2015, however, would result in a somewhat higher estimate of the MNPL threshold, 17,274 whales.	
			Pacific Coast Feeding Group (PCFG) One way in which the proposed rule seeks to protect the PCFG is through the establishment of abundance thresholds below which hunting would be suspended. Hunting would not be allowed in the upcoming season if the most recent PCFG abundance estimate drops below 192 whales or the associated minimum abundance estimate is less than 171 whales, or if one of these thresholds is projected to be met during that hunting season. Such measures are incorporated into the SDEIS's preferred alternative. The Commission supports the inclusion of the proposed "floors" below which hunting would stop, but, as noted in its comments on the ALJ's	Comments on the PCFG abundance thresholds are noted. With respect to the comment on a "dimmer switch," See Appendix C Responses to Frequent and Substantive Comment #20- PCFG Abundance "Dimmer Switch".

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			recommended decision, is concerned that there can be a time lag of two or more years between when surveys are conducted and results become available. That was one reason that the Commission recommended that the regulations governing the summer/fall hunt also include a "dimmer switch" that would slow the hunt before the "on-off" triggers are reached, if the number of PCFG whales drops below some higher threshold.2 Without explanation, the SDEIS does not consider this alternative. The Commission therefore recommends that this alternative be discussed and analyzed in the final EIS and that NMFS incorporate it into the preferred alternative and the regulations. --- 2 In its comments on the ALJ's recommended decision, the Commission recommended that the maximum number of strikes authorized during the summer/fall hunt be reduced from two to one per year if the abundance of PCFG whales (Nbest) drops below 212.	
			Identification of Western North Pacific (WNP) Gray WhalesNMFS expects to rely on existing catalogs of photographs and genetic samples to determine whether struck or landed whales are from the WNP stock or are PCFG whales. As noted by the ALJ in his recommended decision, "[i]n the event the catalogs are not kept current and at an adequate standard, NMFS would not issue a hunt permit." Unlike the case concerning the PCFG whale catalog, NMFS has little control over the upkeep of the catalogs for WNP whales, which depends on research conducted in waters under the jurisdiction of Russia.The shift in relations between the United States and Russia since publication of the 2015 DEIS is a changed circumstance that could significantly affect the ability of the United States to identify WNP gray whales reliably, either through losing access to the catalogs or impairing the ability of researchers to secure the information needed to keep the catalogs up-to-date. This is an issue that could materially affect NMFS's ability to authorize a winter/spring hunt or to provide continued	See Appendix C Responses to Frequent and Substantive Comment #18 -Maintenance of a WNP photo-ID catalog in light of changing U.S.-Russia relations.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			assurance that no WNP whales occur in the hunting areas at other times of the year. As such, the Commission recommends that NMFS consider and discuss in the final EIS the current tensions between the two countries and their possible implications for continuing access to adequate information on WNP whales. Among other things, it would be appropriate for NMFS to discuss the criteria that it intends to use to ascertain whether or not the catalogs are being adequately maintained.	
			Further NEPA Review The SDEIS notes that at least two additional agency decision points will remain after regulations have been issued, but before hunting would be authorized—consideration of an incidental take authorization for WNP whales and the issuance of hunting permits. It is unclear if NMFS anticipates that either of these actions will trigger the preparation of other NEPA documents and whether the public will have an opportunity to provide comments at those junctures. It would be helpful if NMFS provided further guidance on these points. If additional analyses and opportunities for public comment are not anticipated, NMFS might want to expand the scope of this EIS to address the broader suite of issues likely to arise during these other phases.	As described on our Frequently Asked Questions webpage, there are a number of remaining steps if a waiver is granted. As part of the MMPA permit process, NMFS would determine the appropriate level of NEPA review needed at that stage of the process. This would also apply to other steps in the process.
			Technical Comments Section 2.1.4 — This section states that, under Alternative 7, no more than 25 ENP gray whales may be harvested over the 10-year waiver period. As we read Alternative 7, that number should be 20. Up to 15 could be harvested in the winter/spring hunts (3 per year for 5 years). During the summer/fall hunts only one whale could be harvested in each of the five years of the hunt. --- 3 This is the number given on page 44, in Table 4-1.	This infomration was clarified in the FEIS (see Subsection 2.3.7.1.1, Number of Whales Struck and Harvested (Annual and 10-Year)).
			Section 2.1.10 — As drafted, the last sentence of this paragraph is confusing and it is unclear who may do what with handicrafts made from	If a waiver is granted, the regulations will specify who may do what with handicrafts made from whale

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			whale products. It would be helpful if it were redrafted to track section 216.116(a)(2) of the ALJ's version of the proposed regulations more closely to clarify that any person may possess, purchase, sell, barter, etc. a handicraft once it has been marked and certified.	products. We do not believe this information is necessary to inform the analysis of the alternatives under NEPA.
			Table 3-7 — The cell concerning OSP for the ENP stock is either incorrect or, at best, confusing. It states that the stock is at 91 percent of K and cites Punt and Wade 2012 for this determination. As noted in the first paragraph on page 22 of the SDEIS, Punt and Wade estimated K to be 25,808 whales. If the most recent abundance estimate given in the table is used (20,580), the stock would be at less than 80 percent of K.	We have updated Table 3-11 in the FEIS.
			Section 3.2.2 — In the paragraph before Table 3-8, the number of stranded whales is given as 678. Presumably, the number cited in the table and elsewhere in the SDEIS (578) is correct.	We have corrected this discrepancy and updated the stranding data throughout the FEIS.
			Section 4.1.6.3 — The second paragraph of this section lists five potential scenarios under which hunting would cease. This list appears to be limited to scenarios triggered by the taking or abundance of ENP and PCFG whales. Although stated elsewhere, it would be worth clarifying here that whaling also would cease if a WNP whale were struck. Thank you for taking these additional comments and recommendations from the Commission into account as you prepare a final EIS and consider the adoption of final regulations.	FEIS Subsection 4.1.1.1, Potential Number of ENP and PCFG whales Killed; Likelihood of Striking a WNP Whale; Likely Number of Whales Harvested, has been clarified.
0487	PCPW	10/14/22	Please accept these comments on NMFS' recently released Supplemental Draft EIS, on behalf of the PCPW. We are a grass roots group based in Port Angeles, WA, who came together in 1998 to oppose the killing of gray whales in the waters of Clallam County. We have a long-term understanding of the views of our community, and know that we represent the views of the great majority. Not in an opposition to treaty rights in general, but in the sincere belief that the inhumane harassment and killing of our gentle aquatic neighbors will do unnecessary harm to our human	These introductory comments are noted.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			community relations, as well as to our small group of resident gray whales. We oppose the killing of any whales for any reason, but feel that we must be particularly vocal about protecting the "locals".	
			From the Introduction to the SDEIS, 1.1, pg 4:"Issuing this SDEIS provides the public with the opportunity to comment on the composite alternative and updated information..."PCPW comment:"The public" has no idea that there is a comment period underway. PCPW received a special alert, likely because we were a party to the ALJ Hearing process. We waited in vain to see an official press release to inform "the public", both in our local paper , and in the regional media. We are told that NMFS' only obligation to "the public" is the issuance of a Federal Register notice. That method of informing the public will never be effective. We ourselves (PCPW) do not continually check the Federal Register, or NMFS' "social media". Neither do we feel that we should have to nag the local paper to run comment information, (as we have done in the past), or write an informational letter to the editor, (as we have done in the past), or try to convince NMFS' own public spokesperson to create a succinct informational press release at the very **start** of NMFS' always too short comment periods, (as we have done in the past.) An official NMFS press release to the local newspaper needs to be mandatory protocol for rural communities at the heart of NMFS' actions. Communities,such as this one, who still receive their local news from the newspaper. And as much as PCPW understands the feelings of our community, we cannot speak for all. Why have a "public relations person" if that person cannot send out important information to news outlets utilized by "the public" ? No, this SDEIS has only been viewed by the few who have made it their full-time job to remain vigilantly informed over the last 25 years, or those who hear about it through some "grapevine". "The public"on the Olympic Peninsula, "ground zero", is still very much in the dark.	The SDEIS was released on July 1, 2022 via publication in the Federal Register, NOAA Fisheries website, and notice to the parties who participated in the hearing before the ALJ. We disagree that this was not sufficient public notice.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			SDEIS , 2.1.1 Location of Hunt Area , pg.9 : **The location of the hunt area will be "...the Makah Indian Tribe's Usual and Accustomed fishing grounds ...(excluding the Strait of Juan de Fuca)."** **PCPW comment:** Those people relatively new to the whaling issue may not know why that exclusion from the Strait is in place. It is relevant to relate the history behind that brief statement. In 2001, the Makah Tribal managers devised an expanded hunt plan that did include the entire Makah U&A : the outer coast portion as well as east into the Strait to Tongue Point , also known as Salt Creek County Park and Campground This hunt would have no time or area restrictions. NMFS agreed. There was no public comment allowed. And, said NMFS, the gray whales feeding spring, summer, fall and winter along the south shore of the Strait , the oft-sighted ones that we called "resident whales," did not exist as a group distinct from gray whales migrating north to the Arctic. The Makah could kill 4-5 per year. 20 every 5 years. There was no analysis of the impacts. We objected mightily to all aspects of this radical new plan. People living and recreating and traveling regularly along Highway 112 understood the problems: – In the Strait, gray whales feed in shallow water within a mile of shore, often much closer. We know this, because we see the whales feeding here in every month of the year, including at Tongue Point. – The whalers' NMFS- approved weapon is a .50 caliber rifle. A .50 caliber shell can travel 5 miles and can also ricochet off the water and speed off in unpredictable directions. – PCPW and others gathered and shared this information locally, raising objections to NMFS' plan to allow the .50 cal into the Strait, on the	The background information is noted. Subsection 4.6.2.1, Tourism, describes Olympic National Park and visitors to the Park. Section 4.15, Public Safety, assesses impacts to public safety under the action alternatives.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			grounds that it was extremely unsafe for the public. We also insisted that the "local whales" be protected. The 9th Circuit Court agreed with plaintiff NGOs that NMFS had acted unlawfully by not preparing an EIS. Fast Forward: **2015 DEIS : "Project Location" 1.1.2 pg.1-3** contains the subsequent, post 9 th Circuit Court loss, plan for the hunt area : **"The Makah's proposed action area is smaller than its adjudicated U&A because the Tribe proposes to exclude the Strait of Juan de Fuca to address concerns about public safety and the effects on gray whales in that area of its U&A."** Both of our points were conceded by NMFS and the Tribe : The .50 caliber should never be fired within range of innocent bystanders, and there is a group of genetically distinct whales, whose small numbers demand concern. As to "bystanders", in response to PCPW's comments about the same danger to Olympic National Park visitors on the coastal beaches as existed along the Strait, the 2015 DEIS added Alternative #3, that would take the hunt five miles off-shore. NMFS acknowledged that Alt.3 , the "Offshore Hunt", would help mitigate the very real danger to"bystanders"(campers and hikers in the National Park), from a powerful .50 cal. shell that can travel 5 miles on a missed shot. But it is now clear that NMFS will refuse to choose Alternative #3, the "Offshore Hunt ", to move forward. They propose more near-shore hunts in all seasons, right up against the Wilderness beaches of Olympic National	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Park. And the very same resident whales that feed at Tongue Point will be among the easiest targets as they spend time feeding on the coast. It seems that modern day Makah whalers do not want to go offshore even 5 miles. (Jonathan Scordino, ALJ testimony) While we have no objection to NMFS' concern for National Marine Sanctuary "resources"(birds), it does highlight the fact that there is, as always, no mention of the need to consult with Olympic National Park about threats to some of their "resources" : people visiting the Park. And there is still no answer to the question: WHO WILL BE HELD LEGALLY LIABLE FOR ACCIDENTAL GUN SHOT INJURY OR DEATH OF "BYSTANDERS" HIKING AND CAMPING ON OLYMPIC NATIONAL PARK BEACHES?? "Accidental" but avoidable.	
			SDEIS , 2.1.2 Timing of Hunt pg. 9Winter / Spring Hunt "Migration Season"December 1 – May 31Summer / Fall Hunt " Feeding Season"July 1 – October 31PCPW Comments:Regarding the "Migration Season Hunt":ALJ Jordan's Recommended Decision states that :" **The best available scientific evidence shows that the removal of a single WNP whale would be detrimental to the stock...I consequently recommend...the Makah Tribe obtains an Incidental Take Permit (ITP) for take of WNP whales.**" He also recommended that no training activities take place during "migration season" without a permit. But even if an ITP is granted to the Tribe , a strike on a WNP gray whale will have the exact same grave and isadvantaging impact on that small endangered stock as if they hunted without one.**"NMFS must ensure that approving a waiver will not jeopardize the WNP." (Judge Jordan)**The issuance of an ITP does nothing to safeguard the WNP. It will just allow NMFS and the Tribe to go ahead and play "Russian Roulette"with this depleted whale stock.NMFS declares that there is a "very small risk"of striking a WNP whale. Remove the words "very small"...**there is a risk. Period. ITP or**	We have incorporated and evaluated the new information, regarding the ENP gray whale stock in the FEIS.We updated the estimates of the probability of striking a WNP gray whale (see Moore, Jeffrey E., David W. Weller, and Aimée R. Lang. 2023. Estimates of the probability of striking a western North Pacific gray whale during the proposed Makah hunt: 2023 update. U.S. Department of Commerce, NOAA Technical Memorandum NMFS-SWFSC-682. https://doi.org/10.25923/hxhv-sb94Subsection 4.1.2.3, Potential Number of ENP and PCFG Whales Killed; Likelihood of Striking a WNP Whale; Likely Number of Whales Harvested, describes the available information on mixing proportions and the basis for the proportions used in the analysis. See also Appendix D Responses to Frequent and Substantive Comment #12-Risks to WNP gray whales.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			not.The number of WNP whales ID'ed on the southbound and northbound migrations keeps rising. There is no way to accurately predict the "odds" of hunters encountering one. But the risk rises with every new ID made. The current number is 54. Many, if not all, ID's seem to be made in the coastal nearshore as they pass Vancouver Island and Washington State. Where is the sighting data for these WNP whales that would provide the public with the exact locations?_____ _____**** AND THIS JUST IN: new population estimates of ENP whales reflect a significant drop in numbers. A 40+ % drop! The odds of striking a WNP gray whale, sadly, just went up. The risk must be recalculated.***_____ _____**And why are WNP whales found in the nearshore with the PCFG whales? In both directions, north and southbound, they need to eat before and after their huge migrations across the Pacific Ocean. That travel requires immense amounts of energy. Why would they choose to cut off-shore with the main ENP "herd", heading either direction, when desperately needed food can be found near shore in the Biologically Important (feeding) Areas of the PCFG ? It is likely that the WNP grays have been feeding with the PCFG whales, fall and spring, for a long, long time. Some of the WNP whales will be heavily pregnant southbound (December, January). Many will have calves with them or be newly pregnant on the northbound journey (February, March, April, May).**The new WNP mothers need to stay near shore with their calves as much as possible. Just like the PCFG mothers, feeding is required to support nursing, resting time is also important. Vigilance is necessary to protect against deeper water orca attack . This danger keeps mothers and calves near shore when possible. Whether gray whale mothers and calves are slowly transiting	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			through, or will stay the spring and summer, the nearshore of the northern Washington's coast is a calf rearing nursery with particular needs. There should be no deliberate disturbance from hunting or practice in this area that would spook mothers and calves from the space they need to feed, nurse, rest, and shelter.It is not enough to promise that strikes will not be made on mothers with nursing calves. It is also inaccurate to claim that mothers and calves occupy completely different areas of the nearshore feeding grounds, and therefore will not be bothered by hunts or practice activities. These sensitive and vulnerable females, whether WNP, PCFG, or ENP , will certainly be frightened and spooked from the feeding areas during many of the hunts and practices. Energy will be wasted and time feeding and nursing will be lost while they attempt to avoid noisy boat traffic, gun shots, "practice throws", etc. None of this activity should be allowed in the coastal near shore of the Makah Tribe's U&A during the "winter-spring hunt." **These hungry whales need to forage unimpeded in one of their core, critical feeding habitats.*** _____ _____ ***THIS JUST IN: ENP CALF COUNTS ARE AT AN All TIME LOW LEVEL. Have the WNP calf counts also gone down? Every calf is now rarer and more important than ever, and if the population is to rebound, their needs must be respected.*** _____ _____ Judge Jordan stated that "...**training activities should not be permitted when WNP may be present in the Makah U&A."** An ITP will not mitigate the criminal level harassment of the "training activities". **And if the Judge feels that WNP whales should not be exposed to it, then neither should any of the whales, particularly the mothers, calves and pregnant whales of all the gray whale groups.NMFS labels December 1 – May 31 "migration season".** This is not a complete description of the Makah U&A during the	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			stated time frame. The PCFG and ENP gray whales' use of the outer coast near shore during this time is actually quite varied. **Whale presence on the Northwest coast of Washington State between Dec-May 31 includes :**– The presence of PCFG whales feeding, who never went south.– The presence of PCFG whales, migrating or not, engaged in mating activity.– The presence of heavily pregnant female PCFG whales intending to head south.– The arrival of newly pregnant PCFG whales arriving back to PCFG feeding grounds.– The spring arrival of PCFG mothers and calves, feeding and nursing near shore.– The early spring arrival of PCFG whales anxious to begin feeding– The early spring arrival of "Puget Sounder" whales, entering the Strait of Juan de Fuca.– Some northbound ENP mothers and calves who may not "cut the corner "off shore, but travel, feed, nurse, and shelter, closer to the safety of kelp beds on the Washington and Vancouver Is. coasts. **All gray whales will be very hungry during a UME.Newly pregnant females may not carry calves to term if their nutritional needs are compromised.There will also be WNP gray whales in the coastal portion of the Makah U&A throughout that time frame :**– South bound WNP whales will pass through in December, and early January.- WNP whales may be engaging in mating activities in the "project area" in December.- WNP gray whales may be feeding in the "project area" in December.- WNP whales may be heavily pregnant as they pass south through the area in December.**As the WNP migration heads northward:- WNP whales are known to be in the "project area" from March through May.– The WNP mothers and calves will be feeding and nursing in the near shore, like the PCFG and ENP mothers and calves. They should be allowed this time in the "nursery" to prepare for their imminent journey back across the Pacific Ocean. They are hungry, sensitive and vulnerable. It is heartless to open them up for harassment. There should never be a hunt or practice season in the near shore in March, April, and May. And there is no ra*tional reason*	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			for a "hunt season" in December, January, and February.**In all hunt plans and calculations of "mixing" numbers, it must be acknowledged that 20,000 gray whales do NOT migrate through the nearshore of the northern Washington coast. They DO travel close to shore in some coastal areas of California and Oregon. That is because the continental shelf drops off to deep water closer to shore in those areas, and gray whales prefer to travel over the shallower water. The continental shelf widens out off Washington's coast affording gray whales a wider migratory corridor. (See Green, et al.) They can "cut the corner" and get up to arctic feeding grounds faster by not hugging the shore through the "project area".Most of the main herd is seen from the coast as distant blows moving steadily north or south. Binoculars may be needed , but the blows are sometimes visible to the naked eye when conditions are conducive. MOST of the 20,000 ENP gray whales have always, and still do, travel more than 5 miles off shore. That is where a hunt for actual migrating ENP gray whales should take place.** **_____** ****THIS JUST IN : With a huge population drop now verified, "mixing" numbers must be recalculated. With fewer ENP whales in the mix, the odds must be assumed to have gotten higher for striking WNP and PCFG whales in the nearshore in spring.** ***_____** **_____** **_____**	
			The Summer / Fall "Feeding Season Hunt" **July 1- October 31** **PCPW Comments:** This hunt has only one target for harassment and for death: the "resident grays", the "locals", the "PCFGs". Things have certainly changed since the years (1997-2000), when NMFS and the Tribe reluctantly agreed to *only*	We have incorporated and evaluated the new information regarding the ENP gray whale stock in the FEIS. We updated the estimates of the probability of striking a WNP gray whale (see Moore, Jeffrey E.,

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			target *migrating* whales. Now targets are on the backs of every one of the very few (35-40) local Makah U&A gray whales. This is unsustainable at any quota level. The "co-managers" have never wanted to have to avoid killing these convenient ("sitting duck") whales. The judges of the 9th Circuit Court required NMFS to study the problem, and emphasized the importance to the local environment of these local whales, genetically distinct or not. The local whales then became *very* inconvenient to hunt plans. Makah whaling proponents wanted a substantial "by catch" quota of local whales. Killing by another name, ("accidental"), was acceptable to the tribe and to NMFS. **But NMFS had an additional "work-around" to try, as well. Deny the PCFG stock status, and declare a quota on the PCFG based on the total number of PCFG IDed whales, instead of the smaller subsets of PCFG whales: the Oregon-Vancouver Is. (OR-SVI) or Makah U&A PCFGs.** **These local whales have become so calm, trusting, and habituated to close approaches by tribal biologists' motorized boats, that they will have to become wary and frightened to survive the abuse that will soon come, if this hunt is approved. Jonathan Scordino stated at the ALJ hearing that he has observed and experienced "friendly" behavior from the local whales.** **When this trust is broken, the"bait and switch" will swap camera for harpoon, and dart gun for .50 caliber shell blasts. The summer "Feeding Season" hunt is an abomination. These whales are always hungry after their winter fast, but now are also suffering existential peril with the effects of the UME : diminished body condition , lowered birth rates, and possible starvation. Whatever the causes of the UME, there is a diminishing food supply in the benthic feeding**	David W. Weller, and Aimée R. Lang. 2023. Estimates of the probability of striking a western North Pacific gray whale during the proposed Makah hunt: 2023 update. U.S. Department of Commerce, NOAA Technical Memorandum NMFS-SWFSC-682. https://doi.org/10.25923/hxhv-sb94 Subsection 4.1.2.3, Potential Number of ENP and PCFG Whales Killed; Likelihood of Striking a WNP Whale; Likely Number of Whales Harvested, describes the available information on mixing proportions and the basis for the proportions used in the analysis. See also Appendix C Responses to Frequent and Substantive Comment #12-Risks to WNP gray whales.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			grounds of the arctic. South of the arctic, rapidly changing conditions such as ocean acidification, water temperature rises, low oxygen episodes, and toxic algae blooms will harm and reduce most prey species. **And now, even with the gray whales in such fast moving peril , there is no re-thinking of this decision to harass, maim, kill , and eat weakened, starving animals. There should be no "cultural value or pride" extracted from that. Only shame that they do not now help the struggling whales.**	
			SDEIS 2022 Numbers of Whales Struck or Lost 2.1.3 pg.9 :PCPW Comment: If a WNP whale is struck "...all hunting will cease unless and until NMFS determined that measures were taken to ensure that no additional WNP gray whales would be struck during the remainder of the waiver period." **Would a ban also occur if WNP population numbers drop below a specific threshold ? NMFS claims "...a very small risk of striking a WNP whale." They are still describing and admitting a risk. Have the WNP been affected by the UME/ food reduction? What is a current population count for the WNP?**	Although a low abundance threshold is not included in the alternatives for WNP gray whales, the alternatives do consider a range of measure to reduce the likelihood of impacts to these whales. Subsection 3.4.3.2, Western North Pacific (WNP) Gray Whales, includes the best available information on the WNP population.
			SDEIS 2022 ENP Population Abundance Threshold Sub-alternatives 2.1.5 pg.10 **PCPW Comments:** **PCPW has, in the past, challenged NMFS to show any sign of concern in regard to the ENP population . How low of a population drop is too low, we have asked. NMFS has always maintained that whatever the drop, the ENP are always "at (a new) carrying capacity", and therefore "robust" and beyond concern.** **Now the ALJ has joined PCPW and others in stating the obvious: there must be a meaningful and precautionary low threshold**	The SDEIS and FEIS present information on several abundance thresholds, but it is not the purpose of these documents to determine what, if any, abundance threshold would be appropriate should NMFS grant the waiver request.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			population number. In a time of recurring UMEs, officially designated, as well as random years of observed bad body condition (skinny whales), the only meaningful threshold is the most protective. NMFS' best offer is c) 18,000 , so this is the low threshold sub-alternative that PCPW would endorse, although we would prefer it to be 20,000. It is not now known when or *if* the current UME will end. Will sea-ice re-form in arctic waters? Will the arctic food web come back to "normal" benthic prey production? Or will gray whales need to push continually northward? Where is the northern limit of a viable food supply for them? Will some by necessity head east to the Atlantic Ocean? Is this on NMFS' radar at all ? *NMFS' response to arriving at a "low threshold" population estimate for the ENP will be to halt hunting. Why was this UME-specific report issued without updated population estimates for the PCFG and the ENP ?* **** THIS JUST IN: Days before the comment deadline, new population numbers were released by NMFS, describing a very large drop in the ENP gray whale population. (Eguchi, Lang, Weller) The question of which "low threshold" estimate to consider implementing, has become more complicated. The sub-alternative 7(c) 18,000 , the estimated MNPL, has fallen as a threshold, as the new estimate is 16,650. Where does this leave sub-alternative (b) 16,000 ? There will be information next year, presumably, but for now, the "low estimate" falls below 16,000, at 15,170. No one knows what the outcome will be of the next count, this winter-spring. The important thing is that there does need to be a precautionary threshold. And there does need to be public input on the threshold chosen. Neither 7(a), 7(b) are acceptable. It must at least be holding solid at 18,000.**

			_____ _____	
			SDEIS 2022 Limits on Harvesting PCFG Whales 2.1.6 pg.10PCPW Comments:"Harvesting PCFG Whales" was never supposed to be a deliberate " thing", but there have now been a variety of plans for that very thing. Current plan: including struck and lost, 25 PCFG gray whales could be taken out every 10 years. Females will be among the unidentified struck and lost. This plan will harm the entire OR-SVI population, but will disproportionately disadvantage the faithful "39 " local gray whales. Other PCFG whales will meet a gruesome fate, but the 39 will be the first to get whittled down below viability. Eight females are available for harvest out of every 16 PCFG landed, and others will be struck and lost. Local feeding areas, particularly in the Strait, will eventually be forgotten and abandoned. Feeding areas in the Salish Sea will no longer benefit from their presence. People will no longer benefit from the joy of viewing them from shore, and simply knowing that they are there, living their lives in peace. As adult gray whales are killed, younger gray whales will increasingly be left without the knowledge and company of the elders. Breeding age females will be "taken" as will their future offspring, who are the future of the Makah U&A grays, and the wider PCFG gray whale group. How many known mothers are in the MU&A? NMFS acknowledges a time lag in understanding how small populations react to annual losses. How much lag-time is "safe" ? By the time the harm to marine species is recognized by the government, there is always another lag as NGOs must arrange to take NMFS to court to attempt mitigation of NMFS' wrong-headed decisions. Think about the Cooke Inlet belugas, the Southern Resident Killer Whales, the North Atlantic Right Whales , and now the Gulf of Mexico's Rice's whales. It is more often than not	The FEIS assesses impacts to PCFG whales in Subsections 4.1.2.3 (Alternative 2); 4.1.3.3 (Alternative 3), 4.1.4.2 (Alternative 4), 4.1.5.2 (Alternative 6), and 4.1.6.2 (Alternative 7). These subsections are titled Potential Number of ENP and PCFG Whales Killed; Likelihood of Striking a WNP Whale; Likely Number of Whales Harvested. All action alternatives are likely to increase the risk of adverse impacts on PCFG gray whales. Alternative 2 would increase this risk the most, while Alternative 5 would likely increase it the least. Even under Alternative 2, however, the best available information indicates that the PCFG would remain viable.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			too late.NMFS seems never to be guided by the Precautionary Principal. This problem has been obvious for so many years, that the only explanation must be a systemic bias within NMFS that always manifests as a reluctance to place marine species' needs above human desires. NMFS' thumb seems always on the scale , tipping decisions toward political expediency. NMFS' managers and scientists seem to feel no angst in exploiting the loopholes inherent in keeping some scientific results "inconclusive" for many years . In this case , "inconclusive data" means denying protective stock status for the PCFG gray whales. "Inconclusive data" translates to a small unique population being deemed "harvest-able". Deemed, and thus doomed._____ _____THIS JUST IN: Days before the comment deadline, NMFS released a paper (Harris, et al.) with new abundance numbers for the PCFG gray whales. As of 2020, two years ago, the annual average number is calculated as 212. The minimum estimate is 198. That number is only six whales above the hunt-ending "threshold" of 192. *Two more years of UME have occurred, and there is no way to know how many PCFG whales have perished. That threshold of 192 should be presumed to have been breached, until a thorough count can be done. Harris et al. is already outdated.*_____ _____It is time for NMFS to do its' job, and protect the two small gray whale groups: the struggling WNP grays and the diminishing PCFG gray whales. It is also time for NMFS to admit that if ENP numbers do not turn around soon , then the ENP gray whales must be placed back on the Endangered Species List. That will help protect ENP , PCFG, and WNP gray whales in U.S. waters. This action would not denote a "failure" by NMFS. It would represent a realistic and responsible reaction to climate change, and would be**	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			applauded by many scientists and people around the world. It would represent good faith, and an actual belief by NMFS' in its own science. Climate change will have many unforeseen consequences, and this is one of them. *Sometimes the needs of nature surpass the needs of culture.*	
			SDEIS 2022 Whales Approached and Subjected to Unsuccessful Strike Attempts 2.1.7 pg. 10 **This section addresses the topic of "practice approaches and strikes". While the concept of training was briefly addressed in DEIS 2015, this full blown "practice" scenario, complete with approaches and spear-throwing , has not been seen before, or analyzed then or now. It is presented as an accepted reality that will not be analyzed further. But it does raise questions that need to be answered.** **Under Alt. 7, the Tribe must obtain an ITA to make training approaches to WNP gray whales. This potential to approach WNP whales arises from the allowable 353 approaches to ENP gray whales per year, practice and hunting. By what formula was this huge number arrived at?** **During the "Migration Hunt", the Tribe will not know if they are practicing on WNP whales, PCFG whales, or the "allowed" ENP gray whales, but the 353 allowed approaches gives them plenty of chances to motor in and sidle up on all three groups as they feed, rest, and tend to their calves in the nearshore each spring. All these approaches will be made to whales who have arrived at their Biologically Important Areas of sustenance. These whales in the near shore will not be hurrying north, they will be circling, milling, resting, feeding, nursing, moving among the patchy food spots of the moment. These are the whales who will be hit repeatedly with "blunted" harpoons.**	The basis for the 353 approaches under Alternative 7 is described in Subsection 4.1.7.4, Potential Number of Unsuccessful Harpoon Attempts and Approaches (see also Subsection 4.1.2.4). The information provided from the ACS/LA "Gray Whale Census and Behavior Project, 2021-2022 Highlights" is consistent with the non-lethal impacts considered in the analysis and does not change the conclusions.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			The term "approach" means to come inside of 100 yards in a training vessel. No limit on how close to the whale is mentioned, but a stick meant to hit a whale can only be thrown so far. The term "training vessel" means a vessel that is not carrying weapons. No other criteria. The term "practice harpoon" means a "blunted spear that will not break the surface of the skin." **So the "practices" will not need to involve the vessel that will actually be used in a hunt: the canoe. The practice approaches can be made from motorized vessels .** **The "blunted spear" is not described. Will it be made of wood? Can it be made of metal? How much can it weigh? How long can it be? Will it be thrown with the force actually needed to embed a harpoon? Aim is not really too important for harpooners. Anywhere on the large target will attach a float. So what really is the great benefit derived from this excessive amount of "practice" from a very different vessel than what will be used in a hunt, and with a very different "harpoon"? They should tow an inflatable target to throw blunted harpoons at. Based on former paddling practices participated in by canoe crews in 1998-2000 , it is likely that practice crews will be paid to practice. The large number of allowed practice approaches, etc, could lead to a lucrative "sport". A fun money maker for the crews, traumatizing for the hungry whales. The 9th Circuit equated this terrorism by the whalers to "..the D.C. snipers. Kill one, scare many." Trust and calm shattered, what are the whales to do? Suspending feeding, raising anxiety hormones, moving calves quickly away from disturbances can be assumed. The ACS/LA "Gray Whale Census and Behavior Project, 2021-2022 Highlights" describes some recent harassment responses . Observers documented 13 different boats who came too close to gray**	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			whales. The whales' reactions included: 1) nearly all changed directions 2) zig-zagging movements 3) turning outward 4) reversed directions 5) became "stealthy" and disappeared 6) dove longer 7) head-lunged and disappeared These changes in behavior are all signs of fear, stress, and an inability to continue as they had been , whether feeding, resting, nursing, traveling, etc. They burn valuable energy. Multiply these disturbances by hundreds of times a year. Every "disturbance" of the whales by the whalers would be a felonious crime, by any other person , under the MMPA. And as NMFS admits (pg.65), the disturbances "...may be repeated incidents involving the same whale." Obviously.	
			3.2.1.2 Eastern North Pacific Gray Whales pg. 20-22Abundance and Recruitment and NMFS Stock Assessment Report for the ENP Gray Whales_____ _____THIS JUST IN: This entire section is now out of date by the just released Eguchi, Lang paper, and will need an overhaul. The ENP population has dropped at least another 20% since it was written. The section concludes with these last sentences: " The IWC...concluded that levels of harvest and other human-caused mortality are sustainable, given the population abundance." The IWC must go back to the drawing board as well._____ _____**	The FEIS has been updated with the recent publications. Comment on the IWC is noted.
			Table 3-2 pg. 25 Error in footnote (2): This unlawful killing occurred in 2007, not 2008.	Footnote updated (see FEIS Table 3-6).

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			3.2.1.3 PCFG / Abundance and Trends pg. 26-29 **SDEIS pg. 29 : "The PCFG has grown significantly from 39 animals identified in 1996 to 212 animals in 2020.The overall PCFG population has been stable over the last 20 years, declining slightly in recent years from a peak in 2015. Harris et al. (in prep.)"** **In the above quote, NMFS uses the term "*slightly*" to describe a drop from (257) in 2015 to (212) in 2020. This is also described as a "*stable*" population, with a PBR (2020 SAR) of 3.5.** **On page 38, Table 3-7, the "recent trend" for the PCFG is described as "*increasing*".** **_____** **_____** ****THIS JUST IN: A "slight" drop? A "stable" population? PCFG "increasing"? This section is about as misleading as it can be. The opposite is true. The new Harris paper announces that a huge drop in the small population had happened by 2020. That is a two year lag in getting the news out. And there have been two more bad years of the UME, with the lowest ENP calf count ever recorded. What impact have the last two years had on the PCFG and their calves?** **_____** **_____** **No answers here, as the "new" Harris paper is already two years out of date. No conclusions can be drawn as to PBR without fresh survey results. Harris et al. have at least offered a "new" PBR for the PCFG (as of 2020) of 3.1.** **NMFS needs to take this whole section back to the drawing board, and**	The FEIS has been updated with the recently published information on PCFG abundance and trends. See, for example, Table 3-11. See also Appendix C Responses to Frequent and Substantive Comment #13-Risks to PCFG whales.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			not continue utilizing misleading and outdated conclusions. NMFS, unlike the public, had access to the Harris paper as they prepared this SDEIS. They could have taken the time to update their "analyses" before publishing for comment. Does NMFS assume that former population numbers will bounce back so quickly that they do not have to modify their "sales pitch" for killing gray whales? **Not so fast. We all need to see how the UME and it's destructive fall-out actually play out.**	
			SDEIS 2022 National and International Regulatory Environment pg.40PCPW comments:The IWC's touted support of the current hunt plan seems based on a "modeling framework" done in 2012. All reviews and opinions expressed by the IWC are now out of date, and must be subject to facts from the new "actual" environment. An environment of starving gray whales and the lowest calf counts ever recorded. We all need up-to-date population numbers for the WNP, ENP, and PCFG , for the next few years at least, before more human-caused harassment and mortality is inflicted. PCPW's comments on many of NMFS' out-dated notions in this SDEIS have been deleted from this submission as currently moot.	Subsection 3.4.3.3.4, ENP Status, Carrying Capacity, and Related Estimates- IWC IMplementation Review of ENP Gray Whales, of the FEIS addresses the IWC SC's review of the hunt management plan. The SC completed their review of the hunt management plan in 2018, when they determined that it met the conservation and management goals of the IWC. The most recent Implementation Review by the SC occurred in 2020, when they recommended that the "Gray Whale SLA and the Makah Management Plan remain the appropriate basis for the provision of advice on the Chukotkan and proposed Makah hunts." In 2023, the Scientific Committee reviewed new information on ENP gray whale abundance and stock structure and concluded that the SLA and Makah Management Plan are robust to the current UME as well as future mortality events. Therefore, the SC's review of the current hunt plan has incorporated recent information regarding the UME and current abundance estimates.

			SDEIS 2022 4.0 Environmental Consequences pgs. 42-60 **PCPW Comments:** **There is no time remaining in this comment period to comment on all of NMFS' alternatives from DEIS 2015. Needless to say, they all contain out dated abundance assessments. Alt.7 is particularly plagued with misinformation.** **This SDEIS must be sent back to the drawing board, there to await and incorporate abundance information that is current and likely to remain accurate for a few years. Meaningful analysis and conclusions must wait as long as it takes to develop data and observations from "the field" to develop supportable population estimates for the ENP, the WNP and the PCFG.** **The populations numbers *may* stop dropping. They could drop *further.* They *may* plateau. They *may* begin rising. One year's numbers, or two-year-old numbers will not cut it.** **NMFS must stop "assuming". This SDEIS proves that NMFS has no special predictive powers.** **But there is someone who *did* have good judgment and predictive powers: ALJ Jordan.** **He had the good judgment to see clearly , and try to mitigate, the lack of precaution exhibited by** **NMFS in regard to the whales in their "care". Some examples:** **– Judge Jordan: " NMFS must insure that approving a waiver will not jeopardize the WNP...And I consequently recommend NMFS modify the regulations to prohibit issuance of even-year hunt permits (and**	Background comments are noted. The FEIS includes the most recent abundance estimates and analyzes impacts under the action alternatives in this context. The FEIS incorporates three alternative low abundance threshold under Alternative 7 (see Subsection 2.3.7.1.5, ENP Low Abundance Threshold) and -analyzes the impacts of this alternative with and without a low abundance threshold (see Subsection 4.1.7.6, Low Abundance Thresholds). With respect to the comment on a "dimmer switch," see Appendix C Responses to Frequent and Substantive Comment #20- PCFG Abundance "Dimmer Switch".

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			training activities) unless and until the Makah Tribe obtains an Incidental Take Permit for take of WNP whales. **– Judge Jordan: "Abundance threshold - ENP" "I find the scientific evidence weighs in favor of an overall abundance threshold... Set clear lower limits (for the ENP) below which hunting is not permitted."** **– Judge Jordan recommends a "...dimmer switch (for the PCFG)... limiting strikes if there are early signs of decline, rather than waiting for more extensive decline, to cease it entirely."** **– Judge Jordan: " The record does not contain clear evidence about the ability of the PCFG to recuperate from various levels of decline, and specifically what the outlook for the group would be if levels do reach the minimum threshold set in the regulations."** **– Judge Jordan: "However, as the full extent of the UME is unknown, i*t is possible the low abundance trigger for the PCFG has already been met or exceeded if the current UME is affecting the PCFG*."** **And there was the Crystal Ball...** **– NMFS did take a few suggestions. But Judge Jordan's recommendations should be studied to learn the ways of thinking and acting in precautionary ways. New to the subject matter as he was, he came to care about the whales at the center of it all.** **So, as NMFS requires us to continually refer back to DEIS 2015, PCPW would suggest that any topics covered in this SDEIS, and not commented on here, may be in our comments to the 2015 DEIS , or comments from any other occasion in the last 22 years. We haven't changed our minds about anything, we have just learned more about everything.** **And we still ask: who speaks for the whale? Makah Great Grandmothers did in the 1990's. One great grandmother never**

			permits can be issued quickly, and that the tribe can soon resume its traditional whaling.	
491	Frohoff, Toni	10/31/22	On behalf of myself and TerraMar Research, a Washington-based organization, I submit the following comments on the Supplemental Draft Environmental Impact Statement (SDEIS) on the Makah Tribe Request to Hunt Gray Whales (SDEIS). 87 Fed. Reg. 39804 (July 5, 2022). On 27 February 2020, the National Oceanic and Atmospheric Administration/National Marine Fisheries Services (NOAA/NMFS) published notice of its intent to prepare the SDEIS noting that the analysis would include, among other things, information about the ongoing gray whale Unusual Mortality Event (UME) (85 Fed. Reg. 11347, 11348). The SDEIS does not provide such an analysis and its glaring deficiencies, including the failure of NMFS to disclose information critical to the analysis, prevents interested stakeholder from fully understanding the environmental impacts of the action, including alternative 7, the "composite alternative," (SDEIS at 4) and, therefore, is not in compliance with the National Environmental Policy Act NEPA) (40 CFR 1500.1 et seq.).1 I am grateful to the National Oceanic and Atmospheric Administration/National Marine Fisheries Service (NOAA/NMFS) for granting a 60-day extension in the deadline for comment on the SDEIS. 87 Fed. Reg. 50319, August 16, 2022. Among other benefits accrued by all stakeholders as a result of this extension was the publication of the Harris et al. (2022)2 report providing a revised abundance estimate for Pacific Coast Feeding Group (PCFG) gray whales. However, as noted in the 6 October 2022 letter to NOAA/NMFS requesting a second, limited, extension in the comment deadline, the delayed publication of Harris et al. (2022) compromised the ability of all stakeholders to have sufficient time to review the report. In addition, the failure by NOAA/NMFS to provide stakeholders with timely access to its own reports (Eguchi et al. (2022)) 3 containing a revised gray whale population abundance estimate and new	We note the comments raised in this introduction and provide responses to the points as they are raised in detail in the body of the comment letter.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			gray whale calf production numbers is disconcerting. This is particularly problematic given the content of those reports (i.e., documenting an ongoing decline in Eastern North Pacific (ENP) gray whale abundance estimates and the lowest number of northbound gray whale calves since counts were initiated in 1994) and the direct relevance of such information to the subject matter and analysis contained in the SDEIS. Of even greater concern is the fact that NOAA/NMFS originally published the SDEIS on 5 July 2022 (87 Fed. Reg. 39804) while Harris et al. (2022) was still "in prep." and without first publishing the gray whale abundance and calf production papers. Failing to disclose that information before initiating the public comment period and by, subsequently, failing to provide interested stakeholders with a sufficient opportunity to review, analyze, and incorporate such information into their substantive comments demonstrates an astonishing lack of transparency and violates the information disclosure provisions of NEPA. This has fatally compromised the integrity of the decision-making process.In regard to the subject of the SDEIS – the ongoing efforts by the US government to facilitate gray whale hunting by the Makah Tribe, I remain in opposition to this proposed hunt. This opposition is based on science, the law, and ethical concerns associated with the inherent cruelty of whaling. While I fully respect the culture and traditions of the Makah tribe, including those related to whales and whaling, the United States should never have requested a gray whale catch limit from the International Whaling Commission (IWC) as the Makah Tribe cannot satisfy the requirement of having a "continuing traditional dependence on whaling and the use of whales,"4 particularly given the definition of "whaling" under the Whaling Convention Act (16 U.S.C. §916 et seq.).5 Furthermore, the IWC erred in initially granting and subsequently renewing the US request for a gray whale catch limit.Considering the ongoing and increasing threats to gray whales from ship strikes, bycatch, contaminants, ocean noise, ocean warming, including	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			localized and regional marine heatwaves, as well as the "endangered" status of Western North Pacific (WNP) gray whales, the ongoing UME, the dramatic decline in Eastern North Pacific and Pacific Coast Feeding Group (PCFG) gray whale abundance and calf production, and questions about whether PCFG gray whales should be designated as a management stock under the Marine Mammal Protection Act (MMPA)(16 U.S.C. §1361 et. seq.), it is, at best, premature to authorize the Makah Tribe to kill gray whales. The recent documented loss of 38 percent of Eastern North Pacific gray whales6 between 2016 and 2022 and 18 percent decline (257 to 202) in PCFG gray whales between 2015 and 2020 (SDEIS at 31, Table 3-3 citing Harris et al. (in prep.), should provide NOAA/NMFS with sufficient cause to terminate this entire decision-making process. While ENP gray whales recovered after the 1999/2000 UME, it would be entirely speculative to assume that such recovery will automatically occur again given the fundamental, paradigm shifting changes in the Arctic that are transforming a benthic driven ecosystem into a pelagic one.For these reasons and considering, as will be discussed below, the deficiencies in the SDEIS, I strongly support Alternative 1, the no-action alternative and encourages NOAA/NMFS to select it as its preferred action should this decision-making process continue. Absent the selection of Alternative 1, I strongly encourage NOAA/NMFS to, at a minimum, suspend the current NEPA decision-making process until it can:1. Determine the cause or causes of the current UME, document a recovery of ENP and PCFG gray whales, and published a second SDEIS containing a more accurate and comprehensive analysis of the environmental impacts of the action alternatives using the ENP abundance estimates published in Eguchi et al. (2022) and after obtaining a more up to-date abundance estimate for PCFG gray whales.7 In addition, NOAA/NMFS, in collaboration with Russian scientists,8 must endeavor to obtain a new abundance estimate for WNP gray whales as the current estimate is six years old.NOAA/NMFS has	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			established a team of scientists to study the causes of the current UME. SDEIS at 51. The status of that investigation is unknown as is any indication as to when the expert team may publish a report in its findings. Nevertheless, the 38 percent decline in ENP gray whale population abundance from 2016 to 2022 is alarming and it is imperative that NOAA/NMFS understand the causes of that decline – and acts to mitigate them if possible – prior to authorizing the intentional killing of gray whales by the Makah Tribe. While NMFS has indicated that this decline is a product of natural fluctuation in the ENP gray whale population,9 the drop in numbers has caused enough concern within the agency that it will engage in a new count of gray whales during the 2022/23 migratory season.10 Until count data demonstrate a rebound in population abundance numbers, NMFS should suspend consideration of the requested MMPA waiver and NEPA processes and not initiate and further decision-making processes including for the Incidental Take Authorization (ITA) or as part of the hunt permitting process. Furthermore, since the environmental impact analysis in the SDEIS is entirely based on what is now an outdated abundance estimate (20,580),11 a revised SDEIS must be prepared using the new abundance estimates for ENP and PCFG gray whales and published for public review and comment.2. Reassess whether PCFG gray whales warrant designation as a population stock under the MMPA. As defined under the MMPA, a population stock is "means a group of marine mammals of the same species or smaller taxa in a common spatial arrangement, that interbreed when mature." 16 U.S.C. §1362 (11). To make this determination, NOAA/NMFS has published several Guidelines for Assessing Marine Mammal Stocks (GAMMS).12 The most recent iteration of GAMMS was published in 2016 and is entitled "Guidelines for Preparing Stock Assessment Reports Pursuant to Section 117 of the Marine Mammal Protection Act"13 (2016 Revision). In the 2016 Revision, NOAA/NMFS state that "[f]or the purposes of management under the	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			MMPA, a stock is recognized as being a management unit that identifies a demographically independent biological population." 2016 Revision at 3. To make that determination, a suite of criteria or characteristics are considered including: distribution and movements, population trends, morphology, life history, genetics, acoustic call types, contaminants and natural isotopes, parasites, and oceanographic habitat.14 Furthermore, "[d]ifferent population responses (e.g., different trends in abundance) between geographic regions are also an indicator of stock structure, as populations with different trends are not strongly linked demographically."15 To demonstrate demographic independence, evidence of morphological or genetic difference in animals from different region can be used. Ultimately, "[d]emographic independence means that the population dynamics of the affected group is more a consequence of births and deaths within the group (internal dynamics) rather than immigration or emigration (external dynamics)."16 NOAA/NMFS last assessed whether PCFG gray whales qualify as a management stock at an internal (NMFS scientists only) workshop held in 2012, ten years ago.17 At that time, NOAA/NMFS used the 2005 version of the Guidelines for Assessing Marine Mammal Stocks as the basis for its assessment as to whether PCFG gray whales warranted designation as a population stock. At that meeting, as summarized in the 2015 DEIS and SDEIS, it was determined that "while the PCFG appears to be a distinct feeding aggregation, 'there remains a substantial level of uncertainty in the strength of the lines of evidence supporting the demographic independence of the PCFG,' and that the group might warrant consideration as a distinct stock in the future."18 Notably, as summarized by Weller et al. (2013), "[m]embers of the TF (task force) ranged in their opinions from strongly agreeing to strongly disagreeing about whether the PCFG should be recognized as a separate stock"19 suggesting that the decision not to recommend the designation of PCFG gray whales as a separate population stock was a narrow one and	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			was far from unanimous.Remarkably, despite clear disagreement amongst scientists participating in the 2012 workshop regarding the stock designation of PCFG gray whales, after passage of a decade, and since publishing not one but two revised versions of the GAMMS, NOAA/NMFS has never revisited its conclusion from the 2012 workshop. This failure is even more egregious given the wealth of new information published about PCFG gray whales since 2012 which provides compelling new evidence demonstrates that PCFG gray whales should be designated as a management stock or, at a minimum, that NOAA/NMFS should take a fresh look at the matter. Among the newly published studies are several published by scientists affiliated with Cascadia Research and others examining various aspects of PCFG gray whale abundance, ecology, biology, behaviors, and genetics.While I firmly believe that the best available science provides compelling evidence that PCFG gray whales should be designated as a management stock, here it is merely asking that NOAA/NMFS engage in a new, objective, and comprehensive analysis of the PCFG stock designation issue before concluding the pending MMPA waiver and NEPA decision-making processes.3. Determine if the Makah Tribe qualifies for an ITA for WNP gray whales. It would appear from an analysis of the SDEIS, that NMFS has decided, as recommended by Administrative Law Judge Jordan, to require the Makah Tribe to apply for an ITA for its potential take of gray whales as a result of a hunt (if authorized). I question whether NOAA/NMFS can legally grant the ITA particularly since the Makah Tribe's potential take of a WNP gray whale will be intentional not incidental. With the exception of a handful of well-known and distinctly marked PCFG gray whales, ENP, PCFG, and WNP gray whales cannot be distinguished in the field.If NOAA/NMFS does not share this view, then it erred by failing to complete the ITA decision-making process before publishing the SDEIS. Not only would the ITA process have produced information that could – and should – have been	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			disclosed in the SDEIS but, as explained in more detail below, a decision to reject the ITA after this NEPA process is concluded would invalidate or require substantial revisions to several of the action alternatives assessed in the SDEIS and compel the need for a revised SDEIS. I am aware of no MMPA regulations that mandate when an ITA decision-making process is initiated particularly when a proposal also requires NEPA compliance. Conducting the ITA decision-making process first, before publishing the SDEIS, would allow for the information garnered through that decision-making process to be fully disclosed and analyzed in an SDEIS as is consistent with NEPA.The remainder of this comment letter will address the content and analysis contained in the SDEIS. In short, I found the SDEIS to be largely devoid of information required to conduct a legally sufficient analysis under NEPA, contains a number of errors including information that is completely inconsistent with the proposed regulations published to govern a hunt (if a hunt is authorized), and its analysis of environmental impacts is superficial and is far from the "hard look" required under NEPA.My concerns about the legal sufficiency of the SDEIS (and the preceding 2015 Environmental Impact Statement (EIS)) are based on whether the analysis provided by NMFS satisfies NEPA. Historically, my opposition to the government permitting the Makah tribe to resume the hunting of gray whales has been based on science, the law, and ethical concerns associated with the suffering inherent to whaling. This remains the case. I, as noted previously, respects the Makah Tribe's interest in preserving its rituals and traditions associated with its whaling past and recognizes the importance of teaching Makah youth their native language and of continuing to practice traditional customs celebrating whales and their whaling past, including dances, tribe and family-specific rituals, songs, and stories. Nevertheless, particularly given the population structure of gray whales and the existing legal standards, the resumption of whaling is not necessary to maintain, sustain, and even expand traditional

			Department of Commerce, NOAA Technical Memorandum NMFS-SWFSC-668. https://doi.org/10.25923/x88y-8p07. 7 While Harris et al. (2022) contains a revised PCFG abundance estimate for 2020, considering the ongoing UME and its impact on ENP gray whales it is imperative that NOAA/NMFS seek a 2022 abundance estimate for PCFG gray whales as their numbers may have also continued to decline. 8 Given the ongoing war being waged by the Russian Federation against Ukraine which has resulted in a number of US-imposed sanctions against Russia, its officials, including its leadership, it is unclear if US scientists are authorized to collaborate with their counterparts in Russia at this time and, if not, when such a collaboration would be possible in the future. The implications of the war on current and future US-Russian Federation scientific and management collaborations, particularly for gray whales, must be disclosed and analyzed in a revised SDEIS. 9 National Marine Fisheries Service, "Gray Whale Numbers Continue Decline; NOAA Fisheries Will Continue Monitoring." 			The SDEIS is Woefully Inadequate and Fails to Satisfy the Requirements of NEPA: As noted in the SDEIS, NMFS is using the 1978 Council on Environmental Quality regulations implement NEPA for this analysis. Those regulations specify that NEPA is the "basic national charter for protection of the environment" 40 CFR at 1500.1(a) and that the "NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken." Id. at 1500.1(b). This information "must be of high quality" and that "[a]ccurate scientific analysis, expert agency comments, and public	The background information provided is noted. We disagree with the conclusion that the analysis is deficient. With respect to the opportunity for comment, see Appendix C Responses to Frequent and Substantive Comment #16-Amount of time allowed to comment on the DEIS. See Appendix C Responses to Frequent and Substantive Comment #4-Cumulative effects and the

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			scrutiny are essential to implementing NEPA." Id. In preparing an Environmental Impact Statement, NEPA regulations specify that: The primary purpose of an environmental impact statement is to serve as an action-forcing device to insure that the policies and goals defined in the Act are infused into the ongoing programs and actions of the federal government. It shall provide full and fair discussion of significant environmental impacts and shall inform decisionmakers and the public of the reasonable alternatives which would avoid or minimize adverse impacts or enhance the quality of the human environment. Agencies shall focus on significant environmental issues and alternatives and shall reduce paperwork and the accumulation of extraneous background data. Statements shall be concise, clear, and to the point, and shall be supported by evidence that the agency has made the necessary environmental analyses. An environmental impact statement is more than a disclosure document. It shall be used by federal officials in conjunction with other relevant material to plan actions and make decisions. Id. at 1502.1. The SDEIS doesn't satisfy such requirements. Some of deficiencies include the following: • Does not provide sufficient opportunity for interested stakeholders to submit informed and substantive comments on the SDEIS; • Does not disclose information critical to the assessment of direct and indirect environmental impacts and/or to provide a credible foundation for the conclusions made as to the impacts of the action alternative, including the composite alternative; • Does not consider a reasonable and feasible range of alternatives particularly by electing to engage in the ITA analysis after completing the DSEIS decision-making process; • Does not accurately assess the impact of the action alternatives on the	future health of the ENP gray whale population in the face of climate change and other threats. See Appendix C Responses to Frequent and Substantive Comment #19-Ongoing UME. Under this header, the commenter does not identify identify specific deficiencies (e.g., related to the information "critical to the assessment" or the assessment of impacts). Specific comments later in the body of the letter are responded to below.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			various assessment factors evaluated in the SDEIS; • Does not conduct a comprehensive examination of the cumulative impact of the action alternatives, including the preferred action, in light of past, present, and reasonably foreseeable future actions that may impact the gray whales and/or its habitat (from the Arctic to Mexico). With these and other glaring and gaping errors in the analysis, the SDEIS is not in compliance with NEPA and should be withdrawn and, should NMFS not agree to suspend the entire decision-making process for the reasons articulated above – replaced with a more comprehensive and accurate revised SDEIS that provides a genuine and objective "hard look" at all of the science and legal issues relevant to the decision to be made. The need to revise the SDEIS is now even more compelling given the two new reports published by NOAA/NMFS just days before the comment deadline on the present SDEIS; documents that demonstrate the ongoing precipitous decline in ENP gray whale numbers and calf production. While the formal determination of the causes of the ongoing UME has not been published, the available evidence suggests that gray whales have a food problem likely emanating to the paradigm shifting changes occurring in the Arctic because of human-caused climate c change/ocean warming. NOAA/NMFS must stop ignoring this likely contributor to the decline in gray whale numbers by attempting to disguise the "borealization" of Arctic marine ecosystems as natural fluctuations in gray whale population abundance. While the gray whale population – like any wild animal population can fluctuate, suggesting that the population will always rebound from such dramatic declines is entirely speculative given the changes occurring in the Arctic. As the gray whale has been celebrated as an example of a species that	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			significantly benefited from the protections afforded by the ESA and MMPA, that success now has become muted, even if only temporarily, because of the litany of factors causing the Arctic to be the bellwether of climate change. As no one can predict the future of the Arctic in the time of such dramatic ecosystem change tied to warming as well as increasing threats to gray whales throughout their migratory route, it is entirely the wrong time to permit the intentional killing of gray whales by the Makah Tribe.	
			NOAA/NMFS has failed to provide the public with sufficient opportunity to review, analyze, and incorporate newly released scientific information into their substantive comments:Inexplicably, NOAA/NMFS published the SDEIS in July 2022 with full knowledge that a new, seminal paper cited in the SDEIS (Harris et al.) was "in prep." While NEPA provides agencies with the ability to address missing and/or unattainable information relevant to an analysis in an Environmental Assessment or Environmental Impact Statements (see 40 CFR 1502.22), in this case the information wasn't missing or unattainable it simply wasn't published. The decision to publish the SDEIS given this missing paper was misguided and inappropriate. While I am grateful that Harris et al. (2022) was eventually made available on a NOAA/NMFS website,20 this was done on 27 September 2022, only 17 days before the comment deadline.To make matters worse, it then became known that NOAA/NMFS had not published two other relevant reports containing a revised abundance estimate for ENP gray whales21 and data on calf production in 2022.22 After waiting for these reports to be published, a group of organizations, sought a second extension of the comment deadline due to the failure by NMFS to publish the two reports in a timely fashion given their direct relevance to the current analysis in the SDEIS. Those reports were finally made available on 7 October 2022, a mere seven days before the comment deadline. This request for a second extension was, contrary to the claims of	See FEIS section 1.5, Public Involvement. See also Appendix C Responses to Frequent and Substantive Comment #16-Amount of time allowed to comment on the DEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			others, entirely intended to secure a limited number of extra days to both allow the reports to be published and to afford all interested stakeholders, including the Makah Tribe, with an opportunity to fully review and evaluate the new information for incorporation into substantive comments.The decision by NOAA/NMFS to reject the request for a second extension was galling both as to its reason and as to an apparent expectation by the government that it can withhold information directly relevant to the analysis in a NEPA document until the very last minute and that this will provide interested stakeholders with sufficient time to incorporate such information into their comments on the SDEIS. Even if, as explained by Ms. Laurie Beale, in an 11 October 2022 email to parties to the ALJ proceedings, NOAA/NMFS missed a Federal Register deadline to get extension language published before the 14 October 2022 deadline, NOAA/NMFS is well aware that it could have reopened the comment period for two or three weeks to ensure transparency and to provide the public with sufficient time to incorporate this new information into their SDEIS comments. This decision does not only reflect badly on the decision-making process, but it prevents the decision makers from having access to a full record, including all relevant information from interested stakeholders, when making their decision.----------20 .See, https://www.fisheries.noaa.gov/west-coast/marine-mammal-protection/makah-tribal-whale-hunt 21. Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			The analysis contained in the SDEIS is based on outdated data and must, at a minimum, be withdrawn and replaced with a new analysis: The bulk of the analysis of the impact of the action alternatives on the abundance of ENP, PCFG, and WNP gray whales and calculation of Potential Biological Removal (PBR) to restrict take (where applicable) is now either out-of-date or up-to-date population estimates (i.e., for PCFG and WNP gray whales) are not available to conduct such analyses. For ENP gray whales, the analysis is based on the 2020 population abundance estimate (20,580)23 and corresponding Nmin (used to calculate PBR) when a new abundance estimate (16, 650) and new min is now available.24 Considering the list of NMFS employees who contributed to the development of the SDEIS, SDEIS at 107, and those who are listed as coauthors on the Eguchi et al. (2022) reports, it is impossible that the NOAA/NMFS team preparing the SDEIS was not aware of the pending publications of Eguchi et al. (2022). Nevertheless, NOAA/NMFS elected to publish the SDEIS despite being aware of new data that would render incorrect a portion of its analysis. Regardless of how or why the SDEIS was published prematurely, it now must be withdrawn and, should NOAA/NMFS elect to continue with the NEPA and MMPA waiver decision making processes, it must draft a new, revised and strengthened, SDEIS for consideration by the public. For PCFG gray whales, Harris et al. (2022) provided a revised abundance estimate for 2020, not 2022. Considering that the 2020 estimate is 18 percent lower than the 2015 estimate, it is imperative that a 2022 estimate be published to determine if the abundance of PCFG gray whales has continued to decline consistent with the decline in ENP gray whales from 2020 to 2022. Absent such an updated PCFG abundance estimate, it would	The analysis in the Harris et al. (2022) is the best available information. As described in the Appendix C Responses to Frequent and Substantive Comments #7-Ongoing UME, the PCFG abundance estimates are on a 2-year time lag. This occurs due to the time delay with photo-identification processing and modeling efforts, and because the definition of a PCFG whale is any whale seen between NCA and NBC in two or more years. Animals need the chance to be seen a second time in at least one year following in order to be classified as a PCFG whale. With respect to the consideration of PBR, see Appendix C Responses to Frequent and Substantive Comments #7-Calculation and use of 'potential biological removal' (PBR) for a PCFG mortality limit.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			be premature, to consider that the PCFG analysis contained in the SDEIS was accurate. Similarly, as the WNP population abundance estimate (290)25 is also six years old, a new population abundance estimate must be published to determine if there is any evidence of a WNP gray whale population abundance decline that may be synonymous with the larger reduction in ENP gray whales. While I am not suggesting that a new SDEIS must be prepared every time a revised population abundance estimate is published, this is a unique situation considering the ongoing decline in ENP gray whales and the duration of the current UME that merits extra caution and concern. Furthermore, while seeking to obtain the data to update all gray whale population abundance estimates which then correspond to the calculation of Nmin, NMFS must also revisit the other variables used in its PBR formula including Rmax and the recovery factor. If a declining population – as is the case for ENP and PCFG gray whales (and perhaps for WNP gray whales), warrants reconsideration and revision of the numerical values for the variables used to calculate PBR, NOAA/NMFS has to provide an explanation as to the basis for the changes and their implications. Absent publication of a revised SDEIS, the analysis in the current SDEIS cannot be considered as accurate and any associated decision would be based on outdated evidence rendering the analysis far short of what's required by NEPA and ensuring that any decisions made are not based on a full record. --- 23. 			NOAA/NMFS has failed to disclose sufficient information or provided information that is incomplete, confusing, or inaccurate and did not provide an objective or critical analysis of the information that was disclosed in the SDEIS in violation of NEPA:NEPA promotes transparency by directing federal agencies to ensure that the public is sufficiently aware of the environmental impacts of a proposed federal action before that action is implemented. That information must be of "high quality" and subject to "accurate scientific analysis." 40 CFR 1500.2(b)." The expectation underlying NEPA is that an agency will disclose all evidence relevant to the decision being made so that such information is available to the public before decisions are made. Moreover, the information provided in any NEPA document must be concise, clear, and to the point and supported by evidence demonstrating that the agency has conducted the relevant environmental analyses. 40 CFR 1500.2(b). In the SDEIS, there are multiple examples of the failure by NOAA/NMFS to disclose information, to provide accurate information, and to engage in the type of critical analysis expected under NEPA. Some of these deficiencies are significant and others less so but they all hinder the ability of interested stakeholders to understand and evaluate the full suite of environmental impacts:	We disagree that we have failed to disclose sufficient infomation or have provided incomplete, confusing, or inaccute information. Scientific literature was published during the open comment period which was made available to the public, and the comment period was extended. See Subsection 1.5.3 for a summary of the public comment process, including extensions granted, on the DEIS and SDEIS. See also See Appendix C Responses to Frequent and Substantive Comments #16.-Amount of time allowed to comment on the DEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			The analysis of mixing proportions in the SDEIS is incomplete, unclear, and inaccurate preventing an accurate assessment of the environmental impacts of the action alternatives on ENP, PCFG, and WNP gray whales: The analysis of gray whale mixing proportions is a cornerstone of the analysis of the numerical impact of the action alternatives on ENP, PCFG, and WNP gray whales in both the 2015 DEIS and SDEIS. In the 2015 DEIS, NOAA/NMFS explained that of the 181 gray whales seen in the Northern Washington PCFG gray whale range, 40.33 percent (73) were subsequently seen within the PCFG gray whale range (Northern California to Northern British Columbia or NCA-NBC) after June 1, 37.02 percent (67) were seen within the Oregon-Southern Vancouver Island PCFG range (or OR-SVI) after June 1, and 33.15 percent (60) were seen within the Makah U&A PCFG range (or MUA) after June 1. 2015 DEIS at 3-140. In the SDEIS, these numbers changed significantly based on the collection and analysis of additional data so that, as explained by NMFS citing Harris et al. (2022), "[f]rom 1996 to 2020, Harris et al. (in prep.) observed 417 whales in the Northern Washington coast survey area (or NWA)26 between December 1 and May 31." SDEIS at 48. NOAA/NMFS then stated that "[o]f these whales, 27.1% were observed in the PCFG range after June 1, while 25.9% were observed in the OR-SVI area and 22.54% were observed in the Makah U&A after June 1." Id. As noted by NOAA/NMFS throughout the DSEIS, DSEIS at 49, this analysis, to be conservative, was premised on the sighting of a single whale seen in the spring within the PCFG range (NCA-NBC) and subranges (e.g., OR-SVI, MUA) before June 1 to the entire catalog of PCFG gray whales seen during the summer/fall after June 1.27 These percentages are subsequently used throughout the SDEIS to assess the numerical impact of a gray whale	While the SDEIS used the recent mixing proportions and data from Harris et al. (2022), the FEIS notes that "Although Harris et al. (2022) used the same methods as Calambokidis et al. (2019) to update these mixing proportions with data from 2017 to 2022, these data were selectively processed in a manner which resulted in a known bias. Therefore, Harris et al. (2022) recommend relying on the previous mixing proportions until future reporting is complete." Thus, the FEIS relied on the mixing proportions in Calambokidis et al. (2019) (see Subsection 3.4.3.4.2, PCFG Seasonal Distribution, Migration, and Movements), and the numbers cited were not utilized in developing those mixing proportions.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			hunt (based on the specific hunt onfiguration under the different action alternatives) on ENP, PCFG, and WNP gray whales. There are a number of concerns, questions, and problems with the mixing proportion data as disclosed and presented in the DSEIS. 1. NOAA/NMFS characterization of the 417 whales seen within the "northern Washington coast survey area" is inaccurate. Those 417 whales, according to Harris et al. (2022) were seen within the NCA-NBC PCFG range prior to 1 June.28 Furthermore, Harris et al. (2022) only indicates that these whales were seen prior to June 1 while NOAA/NMFS characterizes the data as reflecting whales seen between "December 1 and May 31." As Harris et al. (2022) does not provide data on the distribution of these whale sightings by month, it is unclear if they were, as NOAA/NMFS suggests, distributed over a six-month period. This needs to be clarified. There is a discrepancy, however, in Harris et al. (2022) as they suggest that these 417 whales were seen within the NCA-NBC range prior to June 1 (see page 7 of Harris et al. (2022)) when the associated table (Table 3) indicates that the 417 whales were seen within the NCA-NBC between June 1 and November 30 (see page 16 of Harris et al. (2022)). Both statements cannot be true. Either the 417 gray whales were seen prior to 1 June or between June 1 and November 30. If the 417 whales were seen from June 1 to November 30, then the mixing proportions cited above would be for newly seen whales within the NCA-NBC PCFG range that were subsequently cited again within that range and within the OR-SVI and MUA ranges. This must be clarified and its implications to the mixing proportions, which may be significant, explained. 2. For the whales observed in the spring (before June 1), the number (417)	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			are ostensibly of whales seen only once. SDEIS at 49. As noted, NOAA/NMFS selected these criteria to be conservative. Yet, the 417 number, according to Harris et al. (2022) in Table 3 refers to whales that were "newly seen and seen again" meaning that they were sighted at least twice within the PCFG gray whale range over at least two years. The number of newly seen whales (including whales that were never documented to have been seen again) for the NCA-NBC range from 1996-2020 was 904.29 Consequently, whether the statistics contained in the SDEIS, particularly the 417 gray whales which is the basis for the mixing proportions, are of whales seen a single time before 1 June or at least twice within the PCFG gray whale range creates confusion and makes it difficult to determine if the analysis contained in the SDEIS is accurate. This must be clarified. 3. Neither NOAA/NMFS in the SDEIS or Harris et al. (2022) provide an explanation as to how the mixing proportion percentages (i.e., 27.1, 25.9, and 22.54) were calculated. Those percentages, based on the 417 whales ostensibly sighted within the PCFG gray whale range prior to 1 June, correspond to 113, 108, and 94 whales subsequently seen again within the NCA-NBC, OR-SVI, and MUA ranges, respectively. It is not at all clear from either the text or tables contained in the SDEIS or Harris et al. (2022) where these percentages originated or how they were calculated. In examining Tables 3, 4, and 5 in Harris et al. (2022), of the total of 417 "newly seen and seen again" whales observed from 1996 to 2020 within the PCFG gray whale range (NCA-NBC) between June 1 to November 30, 344 (82.5 percent) were "newly seen and seen again" within the OR-SVI range and 175 (42 percent) were "newly seen and seen again" within the MUA over the same time period. If only the "newly seen" whales are considered then of the 904 "newly seen" whales (from 1996-2020) within	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			the NCA-NBC range, 645 (71 percent) and 356 (39 percent) were "newly seen" within the OR-SVI and MUA ranges, respectively. While there may be additional sighting data that have not been disclosed that may explain the origins of the mixing proportion percentages contained in the SDEIS and Harris et al. (2022), from the data that has been disclosed it is not clear how these percentages were determined. This must be clarified and any additional data that may not have been disclosed must be made available for scrutiny by interested stakeholders. 4. It is not clear what the mixing proportion data is describing. Presumably, given the intended purpose of developing mixing proportions (i.e., to assess the numerical impact of a proposed hunt on ENP, PCFG, and WNP gray whales) the mixing proportions should be describing the likely proportion of PCFG gray whales within the larger number of migrating ENP gray whales from December 1 to May 31 which constitute the potential dates of a winter/spring gray whale hunt. Alternatively, the mixing proportions disclosed in the SDEIS may be intended to identify the proportion of all PCFG gray whales seen from June 1 to November 30 within the entire PCFG gray whale range (NCA-NBC) to those seen within the subranges, including OR-SVI and MUA, over the same time period. If, as presented in Table 3 in Harris et al. (2022), the gray whale survey data is for the period between June 1 and November 30, then the mixing proportions in the SDEIS are, in fact, merely examining what proportion of all PCFG gray whales are found within the different PCFG gray whale subranges during summer/fall months. This must be clarified. Regardless of the answer to the correct interpretation of the mixing proportions, to determine such proportions, credible and sufficient data on the observation of gray whales within the PCFG gray whale range (NCA-NBC) must be collected for the period both before June 1 (from December	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			1 to May 31) and between June 1 and November 30. Once such data, including photographs suitable for photo-id purposes are collected, then it can be analyzed to determine the proportion of gray whales originally sighted prior to June 1 to those sighted within the PCFG gray whale range and subranges after June 1 to calculate mixing proportions. This is precisely why determining if the 417 whales identified by NOAA/NMFS in the SDEIS as observed prior to 1 June were, indeed, identified prior to 1 June or, as noted in Table 3 in Harris et al. (2022) were seen between June 1 and November 30 within the PCFG range. Furthermore, it is not clear how extensive gray whale observation efforts are or have been prior to June 1. As reported by Calambokidis et al. (2019), of the 6,815 gray whales observed during surveys conducted within the PCFG gray whale range from 1996-2017, 1,729 (28.5 percent) were observed from December through May.30 This clearly is the result of less survey effort from December through May predictably as a result of inclement weather and potentially dangerous seas. Nevertheless, considering that NOAA/NMFS is supposed to examine the mixing proportion by month (see below), it is unclear if the survey effort during the winter/spring months is sufficient to provide valid survey results. NOAA/NMFS must provide an assessment of this matter to comply with NEPA. These data do not suggest that there are extensive gray whale observation efforts undertaken prior to June 1 each year raising questions about the accuracy of the mixing proportions given the limited sample size from which they are apparently calculated. To obtain the data necessary to predict accurate mixing proportions, a more robust observation effort should be undertaken during the winter/spring and summer/fall months, perhaps with designated observers routinely sampling the same survey areas (and potentially using pre-set survey tracts). To date, while the observation efforts to identify new and returning PCFG gray whales in the	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			summer/fall may, despite their apparent randomness, be sufficient, the survey effort in the winter/spring is inadequate to obtain sufficient data to calculate meaningful mixing rates that reflect actual conditions. 5. NOAA/NMFS correctly indicates that any whales killed, approached, struck, or struck and lost during the summer/fall hunt, if authorized, will, for the purposes of analysis, monitoring, and reporting be considered a PCFG gray whale unless positively identified as a WNP gray whale. SDEIS at 10 and 63 and in the 2019 proposed rules to govern the hunt if authorized (see 50 CFR 216.14(b)(2) 84 Fed. Reg. 13604, 13621 (April 5, 2019)). For the winter/fall hunt, any struck and lost whale or landed whale that cannot be ideniified will be considered a PCFG gray whale based on the mixing proportions of, presumably, ENP and PCFG gray whales during the migratory season. For this purpose, it appears that NOAA/NMFS, until new data become available, intend to use the 27.1, 25.9, and 22.54 percentages as the mixing proportions for gray whales in the NCA-NBC, OR-SVI, and MUA PCFG ranges/subranges, respectively, for the winter/spring hunts. In other words, the same proportions would be applied to each month from December through May. While, admittedly, the description of mixing proportions in the SDEIS is unclear, if this is the intent of NOAA/NMFS then it will be violating the proposed rules to govern the hunt should the hunt be authorized. 84 Fed. Reg. 13604 (April 5, 2019). The proposed rules, make clear, that the use of mixing proportions to determine the take of PCFG gray whales during the winter/spring hunt is to be based on those proportions calculated for each month. For example, in the draft rule text, NOAA/NMFS states that: By November 1 of each year, the Regional Administrator will notify the Makah Indian Tribe in writing of the proportion of gray whales in the hunt area that will be presumed to be PCFG whales and the proportion of PCFG	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			whales that will be presumed to be females for each month of the upcoming calendar year. The presumed proportion of PCFG whales will be based on the best available evidence for the months of December and January through May, and will be 100 percent for the months of June through November. (see proposed rule at 50 CFR 216.14(a)(2) in 84 Fed. Reg. 13604, 13621 (April 5, 2019). It is unclear if the mixing proportions contained in the SDEIS are intended to represent a trial run of those proportions that, by rule, the NOAA administrator will share with the Makah Tribe prior to the start of each winter/spring hunt (if authorized). If they are then they cannot be used for this purpose because they do not reflect the month-by-month mixing proportions as required by the proposed rules and the entire analysis must be redone. Instead of using the mixing proportion data to reflect PCFG and ENP gray whale mixing rates for the entire winter/spring hunt (thereby assuming the mixing proportions remain the same over 6 months or even over three months (March through May) when hunting would be more likely, NOAA/NMFS must disclose the mixing rates per month and use those rates in a new analysis. Logically, as ENP gray whales migrate through the PCFG gray whale range, the mixing rates are likely to change each month with the lowest proportion of PCFG to ENP gray whales in January and February with higher proportions (i.e., a larger percentage of PCFG gray whales of all gray whales observed) observed in May. Based on those changing proportions, the impact of the hunt on PCFG gray whales will vary over the course of the winter/spring hunting season and it is that data and those variable mixing proportions that must be disclosed to the public in a revised SDEIS. Until that is done, the current SDEIS, at least its analysis of mixing proportions, is invalid. --- 26. Although not entirely clear, it appears that the NWA PCFG survey area	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			is synonymous with the MUA PCFG survey area. Calambokidis et al. (2019) only refer to the NWA PCFG survey area while Harris et al. (2022) and the SDEIS refer to the MUA PCFG survey area. 27. Specifically, NOAA/NMFS notes that "[p]ercentage estimates are based on the springtime whale analysis by Harris et al. (in prep.) that compares whales seen in the spring to the entire catalog of whales identified in the PCFG range during the summer/fall feeding period (in contrast to the definition we use in this EIS for PCFG whales, which requires a whale to be (sic) have been seen in at least 2 years). This results in estimates that are likely higher and therefore more conservative than estimates that would be derived from a comparison with whales observed in at least 2 years. We conclude that this conservative approach is appropriate as it allows for the possibility that a whale sighted in the spring might later be seen for the second time in the PCFG seasonal range." 28. Harris, J., J. Calambokidis, A. Perez, and P. J. Mahoney. 2022. Recent trends in the abundance of seasonal gray whales (Eschrichtius robustus) in the Pacific Northwest, 1996-2020. 			NOAA/NMFS ignores the potential for the take of WNP gray whales: The MMPA prohibits the "take" of marine mammals unless expressly	See Appendix C Responses to Frequent and Substantive Comments #12-Risks to WNP gray

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			authorized by an international treaty or agreement to which the US is a signatory or is allowed by permit. 16 U.S.C. §1372 Sec. 102(a)(2)(A) and Sec. 104(a). Under the MMPA, "take" means "to harass, hunt, capture, or kill, or attempt to harass, hunt, capture, or kill any marine mammal." Id. at 1361, Sec. 2(13). Throughout the SDEIS when evaluating the potential impact of Alternative 7 and the other action alternatives on WNP gray whales, NOAA/NMFS primarily focuses on the likelihood of the Makah Tribe striking a WNP gray whale (see, e.g., SDEIS at 9, 46, 47, 48, 49, 63, 64) likely causing the animal's death. While a strike of a WNP gray whale would certainly constitute a "take" as defined by the MMPA, any activity, including even approaching a WNP gray whale during hunt training or hunt scouting activities, also constitutes a "take." By focusing on the likelihood of a strike, NOAA/NMFS ignores the potential for a "take" to affect a WNP gray whale. NOAA/NMFS is aware of the potential for the take of a WNP gray whale associated with any authorized hunting activities of the Makah Tribe. For example, in its summary of the possibility of whales being approached and subjected to unsuccessful strike attempts, NOAA/NMFS states that "[r]ecognizing that actions by tribal hunters, short of killing a gray whale, may affect whales and may constitute a take under the MMPA." SDEIS at 10. Nevertheless, throughout the SDEIS, NOAA/NMFS repeatedly assesses the risks of striking, not taking, a WNP gray whale. Moore and Weller (2019), based on the proposed regulations to govern the hunt should it be authorized, concluded that the risk of the Makah Tribe striking a WNP gray whale is remote (but not zero) but that the likelihood of a "take" each year over the ten-year waiver period is a certainty. For example, in its analysis of Alternative 2 (the Makah Tribe's proposed hunt structure) the likelihood of a take (caused by the approach of a whale during hunting or hunt training) of a WNP gray whale is 1.79, 10.71, and 17.86 over a single year, six years, and over the 10-year duration of the waiver, respectively. SDEIS at	whales.The summer/fall hunt is consistent with proposed regulations (84 FR13604, April 5, 2019) which defined odd-year hunt to mean a hunting season spanning four consecutive months from July 1 to October 31 in an odd-numbered year. Subsection 2.1.2 of the SDEIS describes that "The 2019 Proposed Rule limited winter/spring hunts to even-numbered years and summer/fall hunts to odd-numbered years. The even-year/odd-year hunt language is not a conservation measure. NMFS could remove this language to provide more flexibility in determining when the first hunt season of the 10-year waiver period should take place." The summer/fall hunt under Alternative 7 maintains the July 1 to October 31 timing.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			49, Table 4-2. For Alternative 7 the same numbers are 1.7, 10.6, and 17.65. SDEIS at 66, Table 4-11.For approaches, NOAA/NMFS concede that under Alternative 7, approximately 18 WNP gray whales would be approached during the 10-year waiver period. While it claims that number is unlikely to be reached as many approaches may occur during the summer months when WNP gray whales are not known to occupy the area. Specifically, NOAA/NMFS downplay the potential for an approach to take a WNP gray whale arguing that it "would expect a substantial number of approaches to occur during the summer when ocean conditions are more favorable to training and, during summer/fall hunts, when approaches are restricted to July through October." SDEIS at 65. Nevertheless, since the proposed rules permit up to 353 approaches each calendar year, to be precautionary NOAA/NMFS should assume, for the purposes of the analysis, that all approaches will occur during the winter/spring period when WNP gray whales may be present in the region.Furthermore, the NOAA/NMFS claim that approaches are restricted to July through October during summer/fall hunts is wrong as such temporal restrictions are not included in the proposed rules. See proposed rules at 50 CFR 216.113(a)(4)(i), 84 Fed. Reg. 13604, 13619 (April 5, 2019). With only an estimated 290 WNP gray whales (SDEIS at 17 citing Cooke et al. (2018)),31 the limited scope of the NOAA/NMFS analysis as to the potential impact of a hunt (including all associated activities) on WNP gray whales is significant, does not properly disclose the full range of environmental impacts as required by NEPA, and ignores the primary mandate of the MMPA to avoid the take of marine mammals. The SDEIS must be amended to address the potential for a "take," not just a strike, of WNP gray whales so that interested stakeholders can consider such information in assessing the impacts of Alternative 7 and the other action alternatives as required byNEPA.----------31	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			NOAA/NMFS provides two estimates for the abundance of WNP gray whales including 290 as the "current abundance of WNP gray whales", SDEIS at 17, and, in 2016, an estimated abundance of 320- 410 whales in the combined Sakhalin-southeastern Kamchatka area. SDEIS at 18. It is unclear from the analysis in the SDEIS if both estimates refer to the same populations of WNP gray whales – suggesting a decline in numbers since 2016 – or if the latter estimate is applicable to a larger geographic area. NOAA/NMFS should clarify this matter. Notably, while there are conflicting estimates of the historical, pre-whaling, abundance of WNP gray whales (compare Yablokov and Bogoslovskaya (1984) with Cooke et al. (2019)), if the estimate of 25,000 provided by Cooke et al. (2019) is accurate that the current WNP gray whale population is only 1.16 percent of its historical abundance or, in other words, WNP gray whale abundance has declined by nearly 99 percent.	
			NOAA/NMFS has failed to provide a reasonable range of alternatives as required by NEPA: The SDEIS evaluates seven alternatives. Many of the components of these alternatives are similar but there are some differences as to, for example, the timing of the hunt, the hunt area, limits on struck and lost whales, an ENP gray whale population abundance threshold (limited to Alternative 7), limits on killing PCGF gray whales, and for the duration of the requested waiver and any associated permits. SDEIS at 7 and 8 (Table 2-1). While these alternatives cover several hunting scenarios, many of them would have to be rejected or substantively modified depending on whether NMFS grants an ITA to the Makah tribe to allow the take of endangered WNP gray whales. The SDEIS suggests that NMFS has heeded the ecommendation of Administrative Law Judge Jordan and will require the Makah Tribe to submit a request for an ITA particularly if NOAA/NMFS selects Alternative 7 as its preferred alternative. SDEIS at 11.32 The MMPA permits the issuance of an ITA to all for the "incidental, but not	We disagree that we fail to provide a reasonable range of alternatives. There are a number of steps in the process for considering the Tribe's request (see our Frequently Asked Questions webpage). No decision has been made on the request to waive the take prohibitions. If an affirmative decision is made, the Tribe would then need to apply for a hunt permit. It is premature to speculate that a waiver will be granted and what the Tribe would include in an application for a hunt permit.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			intentional" take of marine mammals for specific activities (other than commercial fishing) within a specified geographical region for no more than five consecutive years. 16 U.S.C. §1371 Sec. 101 (a)(5)(A)(i). There is nothing incidental about the Makah Tribe's potential take of a WNP gray whale if NMFS were to permit a winter/spring hunt. The Makah Tribe, if authorized, intends to hunt gray whales, WNP, ENP, and PCFG gray whales are not readily distinguishable in the field, and, therefore, any hunt of a WNP gray whale would be, as previously noted, intentional. In that case, an ITA cannot be issued. Of the seven alternatives evaluated in the SDEIS, if an ITA was denied, four alternatives (Alternatives 2, 3, 5, and 6), because they permit whaling during the gray whale migratory season when WNP gray whales are known to occupy the ENP gray whale range and traverse the Makah Usual and Accustomed hunting area (Makah U&A), would no longer be reasonable alternatives and would have to be rejected or significantly revised. If they were rejected, that would leave three alternatives (the no-action alternative and Alternatives 4 and 7) although Alternative 7 would also have to be substantively amended to remove the winter/spring hunting season. NOAA/NMFS is aware of the implications of the ITA decision-making process as there are repeated references throughout the SDEIS33 as to how that decision will affect the impact of the action alternatives on the environment, including gray whales, and the viability of the alternatives analyzed. This is precisely why NOAA/NMFS erred in publishing this SDEIS before completing the ITA decision-making process. While I am confident that any requested ITA could not, given the relevant case law, be granted. Should the Makah Tribe elect not to submit an ITA, NOAA/NMFS should	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			terminate the MMPA waiver and NEPA decision-making processes immediately. If the Makah Tribe submits a request for an ITA, it must be denied and the analysis in the SDEIS must be substantively amended so that only those alternatives that pose no risk, even a de minimis risk, of taking a WNP gray whale and any new alternatives that meet that same standard, are analyzed. If it were to reject an ITA request and continue with the current decision-making process without amending the SDEIS, the alternatives that would remain viable would not be sufficient to represent a reasonable range of alternatives as required by NEPA. 40 CFR 1500.2(e). Furthermore, administrative efficiency dictates that NOAA/NMFS should have engaged in the ITA decision-making process first since, if it denies the ITA request -- as it should -- the substantive changes it would have to make to Alternative 7 and/or its introduction of new alternatives to compensate for those disqualified from review, would necessitate a new, supplemental environmental impact statement and public comment period. --- 32 It would also appear that NOAA/NMFS would require the Makah Tribe to obtain an ITA prior to authorizing any whale hunt under Alternatives 2, 3, 5, and 6 as those alternatives include a winter/spring hunt when WNP gray whales may be present along the migration route in the ENP. 33 See, e.g., SDEIS at 65 (potential number of unsuccessful harpoon attempts and approaches); SDEIS at 66 (potential number of shots fired or grenade explosions); SDEIS at 68 (water quality); SDEIS at 62 (Potential timing of hunt and number of hunting days); (Potential number of ENP and PCFG whales killed); SDEIS at 63; SDEIS at 64 (Potential number of unsuccessful harpoon attempts and approaches); SDEIS at 66 (Table 4-11(a); SDEIS at 66 (Potential number of shots fired or grenade	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			explosions); SDEIS at 68 (water quality); SDEIS at 82 and 88 (Economics); SDEIS at 86 (Ceremonial and subsistence resources); SDEIS at 87 (Noise); SDEIS at 88 (Aesthetics); SDEIS at 89 (Transportation); SDEIS at 90 (Public services); SDEIS at 91 (Public safety).	
			NOAA/NMFS has erred in assessing the impact of unsuccessful harpoon attempts on gray whales including PCFG gray whales during summer/fall hunts:NOAA/NMFS relies on a 6:1 ration of unsuccessful to successful harpoon attempts to assess the impact of unsuccessful harpoon attempts on gray whales during the summer/fall hunt. SDEIS at 64. This ration was a product of the Makah gray whale hunt experiences in 1999 and 2000 – when the hunts occurred in May 2019 and April/May 2020 – during the gray whale migratory season. As NOAA/NMFS is aware – since they concede to this point in the SDEIS, the behavior of gray whales during the migratory season and during the summer/fall period can be very different with gray whales, during the former season, engaging in migration while, in the latter season, a larger proportion are likely to be milling and feeding than traveling, making them more vulnerable to a successful strike." SDEIS at 64. Despite admitting that whales encountered during the summer/fall season may be more susceptible to lethal strikes, inexplicably NOAA/NMFS continues to rely on the 6:1 ratio for its impact assessment versus developing an estimate that may be more applicable to a hunt during the summer/fall season. At a minimum, to comply with NEPA, NMFS should examine multiple scenarios to ensure that the behavior of gray whales during the different seasons is sufficiently considered.	As described in the Subsection 4.6.4.1, we acknowledge that the ratio could be lower during summer/fall hunts given likely differences in behaviors. Nevertheless, we use the observed ratio of 6:1 as that represents the best information available based on experience from the 1999 and 2000 hunts. We are not aware of, nor has the commenter provided, any data to inform a different ratio.
			NOAA/NMFS use of a 50:50 sex ratio in analyzing the environmental impacts of Alternative 7 is inconsistent with the analysis contained in the 2015 DEIS: For the purpose of assessing the impact of Alternative 7 on female gray whales, NOAA/NMFS uses a 50:50 sex ratio. SDEIS at 27. In the 2015	See Subsection 3.4.3.4.1, Sex Ratio of PCFG Whales, which provides the information supporting the use of a 50:50 sex ratio.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			DEIS, NOAA/NMFS used a female sex ratio of 59 percent. 2015 DEIS at 3-95 citing Lang et al. (2010). In the SDEIS, NOAA/NMFS refers to several past studies that determined that the gray whale sex ratio was 59 percent females, 53 percent females, and earlier studies that found the female percentage below 50 percent. SDEIS at 27. Instead of using the more recent sex ratio studies, NOAA/NMFS has elected to split the difference and used an equal sex ratio. Considering the importance of determining the best available sex ratio to use in assessing the impacts of the proposed hunt on female whales, particularly PCFG females, the precautionary principle dictates that NOAA/NMFS use the highest documented female sex ratio (so long as the underlying study is credible). Alternative, NOAA/NMFS should engage in further study to attempt to more precisely define this ration is critical so that the analysis can be of high quality as required by NEPA.	
			NOAA/NMFS must reevaluate the environmental impacts of Alternative 7 and the other action alternatives given the decline in ENP and PCFG gray whales: As previously noted, the ENP gray whale population has declined by approximately 38 percent since 2016 from an estimated 26,980 gray whales in 2016 to 16,655 in 2022.34 The current abundance estimate is not only well below the abundance estimate (20,000-21,000) when gray whales were removed from the Endangered Species Act (58 Fed. Reg. 3121, 3125 (January 7, 1993)) but is well below the first of the three minimum abundance thresholds (18,000) included in the SDEIS and approaching the second of the minimum abundance thresholds (16,000). SDEIS at 67. The decline in the abundance estimate also reduces PBR for ENP gray whales from 801 (SDEIS at 25 (Table 3.2) citing NOAA Technical Memorandum NMFS-SWFSC-646) to 497.55 (using Rmax of 6.2 and recovery factor of 1). While PBR is not used to limit the number of gray whales killed under Alternative 7, it is utilized to restrict the number of whales that can be killed under alternatives 2-6.	With respect to the ongoing UME and the decline in population, see Appendix C Responses to Frequent and Substantive Comments #19--Ongoing UME.With respect to the consideration of PBR, see Subsection 3.4.3.3.4, ENP Status, Carrying Capacity, and Related Estimates, of the FEIS.See also Appendix C Responses to Frequent and Substantive Comments #7-Calculation and use of ‘potential biological removal’ (PBR) for a PCFG mortality limit.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Consequently, this requires a reevaluation of the environmental impacts of the proposed hunt not only due to ongoing gray whale population decline but also considering other human-caused threats to ENP gray whales including ship strikes, bycatch, ocean noise, and climate change. Furthermore, given the precipitous decline in the ENP population, NMFS must revisit the other variables used in the calculation of PBR, including Rmax and the recovery factor, to determine if those variables also must be revised or, if kept the same, to provide a cogent explanation for doing so. For the Rmax variable, given the significant decline in calf production numbers in 2022,35 it is clear that ENP gray whales, while previously subject to an Rmax of 6.2, are currently reproducing at a rate significantly less than that.I recognize that the current PBR formula uses Rmax and not the actual rate of reproduction, but it seems inappropriate and biologically reckless to use the current Rmax on a population that is clearly in decline when calculating PBR. Since PBR is intended to determine the maximum number of animals that can be removed from a population or stock as a result of human-caused mortalities (not natural mortalities) while allowing the population or stock to reach or maintain its optimum sustainable population (OSP), SDEIS at v, the precautionary principle dictates, for a declining population, that a more conservative Rmax be used so as to ensure that human-caused mortalities are preventing a population or stock from maintaining OSP. Moreover, while there may have been justification for applying a recovery factor of 1.0 when ENP gray whale populations were abundant and increasing, using the same recovery factor now is questionable particularly if ENP gray whales are no longer at or near their OSP.For the purpose of demonstration, using the revised 2022 ENP abundance estimate (which corresponds to an Nmin of 16,050)36 and the default Rmax (6.2) and recovery factor (1.0), the PBR is 497.55. If alternative values are used for Rmax (4.4; which had been used for gray whales in the past) and a recovery factor of 0.5, the PBR is 176.55.While	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			the current estimated amount of human-caused mortality of ENP gray whales is 130.1, SDEIS at 25 citing NOAA Technical Memorandum NMFS-SWFSC-646 (July 2021), remaining below even the lowest PBR calculated above (176.5), the numbers are exceedingly close and could be exceeded given recent evidence of an increase in gray whale mortalities as a result of ship strikes,37 bycatch,38 and ongoing subsistence harvest.39 Furthermore, if it is determined that the documented decline in gray whales has been, at least in part, the product of the direct, indirect, and cumulative impacts of climate change then, since climate change is human-caused, the current PBR (801) and any of the recalculated PBRs would be well exceeded by human-caused mortalities of gray whales.Indeed, NOAA/NMFS must address the possibility that the dramatic decline in ENP gray whales since 2016 may, in part, be due to climate change; a human-caused mortality factor that is not presently included in the calculation of PBR for ENP gray whales or for PCFG or WNP gray whales as reflected in the NOAA/NMFS gray whale stock assessment reports. At present, even if only small fraction of the 10,425 gray whales lost from the ENP population since 2016 were killed due to human-caused climate change, the current PBR (801) and recalculated PBR (497.55) for gray whales (using Rmax of 6.2 and a recovery factor of 1.0) would be exceeded. For PCFG gray whales, while NOAA/NMFS continues to cling to the fantasy that PCFG gray whale abundance estimates have remained "stable" over the past 20 years, SDEIS at 29, 38, this is belied by the actual data which demonstrated an 18 percent decline in PCFG numbers from an estimated high of 257 in 2015 to 212 in 2020 (the most recent year for which a PCFG abundance estimate is available; see Table 11 in Harris et al. (2022) and SDEIS at 31). Given this decline, NOAA/NMFS must reassess the impacts of all action alternatives that rely on PBR to limit the killing of PCFG gray whales, including PCFG gray whales in the Oregon-Southern Vancouver Island and Makah U&A (NWA-SJF) PCFG region.	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			For example, the current PBR for PCFG gray whales, based on an Nmin of 227, an Rmax of 6.2 percent, and a recovery factor of 0.5, is 3.5,SDEIS at 38 citing Carretta et al. (2021) and 50.40 At present, using the revised 2020 population abundance estimate (212) and its associated Nmin (198) from Table 6 in Harris et al. (2022) along with an Rmax of 6.2 percent and a recovery factor of 0.5, the revised PBR is 3.0.41 --- 34 Eguchi, Tomoharu, Aimée R. Lang, and David W. Weller. 2022. Abundance and migratory phenology of eastern North Pacific gray whales 2021/2022. U.S. Department of Commerce, NOAA Technical Memorandum NMFS-SWFSC-668. https://doi.org/10.25923/x88y-8p07.35 Eguchi, Tomoharu, Aimée R. Lang, and David W. Weller. 2022. Eastern North Pacific gray whale calf production 1994-2022. U.S. Department of Commerce, NOAA Technical Memorandum NMFS-SWFSC-667.https://doi.org/10.25923/4g6h-9129.36 Eguchi, Tomoharu, Aimée R. Lang, and David W. Weller. 2022. Abundance and migratory phenology of eastern North Pacific gray whales 2021/2022. U.S. Department of Commerce, NOAA Technical Memorandum NMFS-SWFSC-668. https://doi.org/10.25923/x88y-8p07.37 The impact of ship strikes on gray whale may be greater than previously considered. As noted in the SDEIS, "a recent qualitative assessment of the co-occurrence of North Pacific gray whales and vessel traffic found that ship strikes, and related underwater noise may pose a significant risk to gray whales (Silber et al. 2021). Areas modeled to be high risk were in the Russian Far East (Kamchatka peninsula and Okhotsk Sea), Bering Sea, Gulf of Alaska, and along the entire west coast of North America. The study estimated that the number of gray whales killed annually rangewide may be in the tens or perhaps low hundreds, and the risk was greatest during gray whale migration periods when animals are near shore and overlap with coastal shipping routes and fisheries." SDEIS at 39 and Silber, G.K., D.W. Weller, R. R. Reeves, J.D.	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Adams, and T.J. Moore. 2021. Co-occurrence of gray whales and vessel traffic in the North Pacific Ocean. Endangered Speices Research. 44. 177-201. https://doi.org/10.3354/esr01093.38 According to the Washington Department of Fish and Wildlife, "[g]ray whales are especially vulnerable to entanglement because of their use of nearshore coastal waters, where fishing activity is often highest. From 1982 to 2018, gray whales were the most frequently entangled whale species along California, Oregon, and Washington, averaging 6.9 entanglement reports per year (NMFS, unpublished data), although actual numbers of entanglements are likely much higher than indicated by these reports." See, Sato, C. and G. J. Wiles. 2021. Periodic status review for the gray whale in Washington. Washington Department of Fish and Wildlife, Olympia, Washington. 32+ iii pp. 39 According to gray whale kill data provided to the IWC, from 2019 through 2022, Russian indigenous whalers killed an average of 133.33 gray whales each year. See, https://iwc.int/table_aboriginal 40 The validity of this PBR level is questionable since the Nmin used by NOAA/NMFS for this calculation is 227 yet 227 is not identified as an Nmin for PCFG gray whale abundance estimates for any year since 1996 as presented in Table 6 of Harris et al. (2022). The Nmin closest to 227 was 224 from 2016.41 Table 3-7 from the SDEIS (page 38) is confusing since it incorporates the 2020 updated PCFG abundance estimate and associated Nmin but lists an old PBR of 3.5 instead of 3.0.	
			Other errors, inaccuracies, and issues of concern: Definition of "IWC Scientific Committee": In the glossary (SDEIS at i to vii), NMFS provides a definition of "IWC Scientific Committee." In that definition, NMFS notes that "[t]he IWC Scientific Committee meets annually in the two weeks immediately preceding the main International Whaling Commission meeting." SDEIS at iii. This is inaccurate. Since 2012, the IWC plenary meeting has occurred	We have updated to the Glossary to reflect the meeting structure.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			biennially. During those years when an IWC SC and plenary meeting are scheduled, the SC meets several months before the plenary to provide commissioners/alternate commissioners and observer organization representatives additional time to review the results of the SC deliberation.	
			Definition of "Schedule":In the glossary (SDEIS at i to vii), NMFS provides a definition of the "Schedule" and states that "[t]he most recent Schedule was amended by the Commission at the 64th Annual Meeting in Panama City, Panama, July 2012. This is incorrect. As NMFS should be aware given its reference to the changes to the Schedule in regard to the IWC's treatment of Aboriginal Subsistence Whaling (see SDEIS at 5 and 41) the Schedule was last amended at the 67th meeting of the IWC in Florianopolis,Brazil, in 2018.42 Due to the Covid-19 pandemic no subsequent meetings of the IWC have been held since 2018 with the 68th meeting of the IWC scheduled to begin this month in Portoroz, Slovenia.----------42 See, https://archive.iwc.int/pages/view.php?ref=3606&k	We have updated the Glossary to reflect that Schedule was most recently updated at the 68th annual meeting in Slovenia in October 2022.
			Potential hunt restrictions are not disclosed or evaluated: In its description of the "Location of the Hunt (Area Restrictions)," NOAA/NMFS notes that certain sites including Tatoosh Island, White Rock, and the Olympic Coast National Marine Sanctuary (OCNMS) "could be subject to hunt restrictions via the hunt permitting process," DSEIS at 9, to protect particular resources including pursuant to consultation under the National Marine Sanctuary Act. NMFS fails to disclose, particularly for OCNMS, what those hunt restrictions may be and, therefore, interested stakeholders are unable to take such restrictions into consideration when evaluating the environmental impacts of the action alternatives. If such restrictions included not landing a killed gray whale on OCNMS	Subsection 2.3.2.2.8 described the area restrictions under each of the action alternatives. It does note that other sites could be subject to hunt restrictions via the hunt permit process to protect Olympic Coast National Marine Sanctuary. If a waiver is granted, the Tribe would apply to NMFS for a permit. NMFS would publish notice of the permit request and solicit public comments, would determine the appropriate level of NEPA review needed, and make a decision on whether to issue the hunt permit.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			land, prohibiting the hunting of gray whales within a certain distance from OCNMS land, restricting the type of weapon that could be used in a near-shore hunt, and/or requiring that any weapons used to strike a gray whale be discharged in the direction away from OCNMS lands to protect the health and aesthetic interests of OCNMS visitor, those would be important restrictions to disclose and evaluate during the current decision-making process. Furthermore, NOAA/NMFS must not limit such restrictions to the above reference locations as there are other areas, including Olympic National Park, Flattery Rocks National Wildlife Refuge, and perhaps sites listed on the National Register of Historic Places that may also merit consideration for such restrictions given their overarching conservation, wildlife protection, and cultural protection objectives. Unless NMFS intends to subject the hunt permitting process to NEPA review, the DSEIS provided the ideal NEPA document to publicly disclose and analyze the impacts of such restrictions. NMFS erred in failing to do so and, consequently, violated the information disclosure requirements of NEPA.	
			IWC and needs statements:In its summary of "International Whaling Governance under the International Convention for the Regulation of Whaling," (SDEIS at 4), NOAA/NMFS states that, in the context of needs of aboriginal communities for whales, "it was no longer appropriate for the Commission to continue to require these "need statements" as a condition for receiving a quota." This is correct. However, the traditional "needs statements" were replaced by documents entitled "descriptions of the hunt" which are available on the IWC website.43 These "description of the hunt" document contain information about need which ASW countries still must provide to the IWC and which contracting governments can take into consideration when determining whether to support an ASW catch limit request or renewal. Unlike the requirement in the past where ASW countries had to resubmit "needs statements" prior to every commission	The 2015 DEIS and FEIS include a more comprehensive discussion of the IWC protocols. We believe this information is sufficient background with which to analyze the alternatives.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			meeting where ASW catch limits were up for renewal, "description of the hunt" documents do not have to be resubmitted unless there is some substantive change to the hunt description, including need, that may be the basis, for example, of a request for a new ASW catch limit authorizing the killing or more whales or additional species of whale.----------43 See, https://iwc.int/management-and-conservation/whaling/aboriginal	
			US bilateral agreement with the Russian Federation: As noted in the SDEIS, the US signed a bilateral agreement with the Russian Federation in 2021 (Fominykh and Wolff, 2021) to allocate the IWC-granted gray whale ASW catch limit between the two countries. SDEIS at 5. Since 1997, the US and the Russian Federation have submitted a joint request (often with other ASW countries) for a renewal of ASW catch limits and, hence, the bilateral agreement is required to effectuate the distribution of the catch limit granted by the IWC. According to NOAA/NMFS the bilateral agreement is renewed annually. SDEIS at 42. Considering the current unprovoked hostilities by the Russian Federation against the people and government of the Ukraine and the subsequent impact on US/Russia relations, it is unclear as to whether the bilateral agreement has been renewed for 2022 and whether it will be possible for such renewals in the future. NOAA/NMFS does not disclose or assess the potential impact of the ongoing war in Ukraine on any future US/Russia bilateral agreement over gray whales, the prospects of the US and Russia submitting a joint request for a gray whale catch limit for consideration at the 69th meeting of the IWC in 2024, nor does it evaluate the impact of the war on the need for monitoring of WNP gray whales. This information must be disclosed and provided to interested stakeholders as it directly pertains to future joint	It would be speculative to consider how the ongoing war may affect future bilateral agreements or requests to the IWC. The NEPA documents assume that these agreements will continue but also describes the impacts to gray whales should they cease. With respect to monitoring see Appendix C Responses to Frequent and Substantive Comment #18 -Maintenance of a WNP photo-ID catalog in light of changing U.S.-Russia relations.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			gray whale ASW catch limit requests and bilateral agreements between the US and the Russian Federation.	
			Number of whales harvested: In section 2.1.4 of the SDEIS, NOAA/NMFS indicates that, under Alternative 7, "no more than 25 ENP gray whales maybe be harvested over the 10-year waiver period... ." SDEIS at 10. It then indicates that "harvest" is defined as "landing a whale."44 Id. This definition, however, is inconsistent with the information contained in Table 2-1 in the rows noting the "Maximum limit for harvest, struck, and struck and lost whales." SDEIS at 7/8. In its summary of Alternative 7 in Table 2-1, NOAA/NMFS indicates that the maximum number of harvested, struck, and struck and lost whales over the 10-year duration of the proposed waiver is "[u]p to 20 harvested, and 25 struck, or struck and lost." SDEIS at 8. The information summarized in the table indicates that the 25 whales "harvested" over the course of the waiver includes struck and lost whales while NOAA/NMFS suggests that in its definition of "harvest" that struck and lost whales are not included. Both cannot be true. NOAA/NMFS needs to clarify whether the 25 whales "harvested" constitute only those who are landed or include those who are struck and lost.----------44 In the glossary, "harvest" is defined as "[t]o kill and land a whale."	This is clarified in Subsection 2.3.7.1.1 of the FEIS which states "Alternative 7 imposes strike limits and landing limits for each hunt season. No more than 25 ENP gray whales may be killed over the 10-year waiver period, and no more than 20 may be harvested (i.e. killed and landed)."
			Change in abundance and viability of the ENP gray whale stock: In section 4.4.1 of the DSEIS, NOAA/NMFS notes that the ENP gray whale population declined from 26,960 in 2016, SDEIS at 71 citing Durban et al. (2017), to "20,850" in 2020 citing "Steward and Weller 2021." The 2020 population abundance estimate is wrong and should be 20,580 and the citation should be corrected to "Stewart and Weller 2021).	The FEIS has been updated with the most recent population data. Table 3-5 correctly cites the 2019/2020 estimate from Stewart and Weller (2021).
			Unusual Mortality Event stranding numbers:In the SDEIS, NOAA/NMFS provides conflicting information about the number of gray whales that stranded as of June 3, 2020. First, it reports that 578 gray whales stranded	The FEIS has been updated with the most recent stranding data.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			as of June 3, SDEIS at 20, but then it states that 678 gray whales stranded as of the same date. SDEIS at 39. As the current total number of gray whales stranded as a result of the UME (as of September 21, 2022) is 606, 45 the former number is correct and the "678" is a typographical error. --- 45 See, https://www.fisheries.noaa.gov/national/marine-life-distress/2019-2022-gray-whale-unusual-mortality-event-along-west-coast-and	
			NOAA/NMFS has failed to disclose sufficient information and provide a level of analysis to properly assess impacts on PCFG gray whales: <u>NOAA/NMFS must reassess the stock status of PCFG gray whales:</u> As previously noted, NOAA/NMFS has grievously erred in failing to revisit the fundamental question of whether PCFG gray whales should be designated as a management stock. Despite over a decade since its last assessment of the stock status of these whales, dozens of published studies, and new methodologies for assessing stock status, NOAA/NMFS appears to be unwilling to reevaluate this matter. To make matters worse, as concluded in Weller et al. (2013) and as noted in both the 2015 DEIS and SDEIS, PCFG gray whales may warrant consideration as a distinct stock in the future. See 2015 DEIS at 2-25 and SDEIS at 29. Yet, no reassessment has been undertaken. gray whales, its analysis of the environmental impacts of Alternative 7 and the other action alternatives on PCFG gray whales is inadequate. For a group of whales that could – and should – be designated as a population stock and given the precautionary conservation paradigm envisioned by the MMPA, NOAA/NMFS should be promoting the alternative that would, if the Makah Tribe is permitted to whale, have the least impact on PCFG gray whales which, according to Harris et al. (2022) only numbered 212 animals in 2020. <u>NOAA/NMFS has failed to justify the PCFG kill allowance contained in</u>	See Appendix C Responses to Frequent and Substantive Comments #5-Stock status of the Pacific Coast Feeding Group (PCFG) of ENP gray whales. The purpose of the EIS is to analyze potential impacts of range alternatives to inform decision-making regarding authorization of a hunt pursuant to criteria under the MMPA and WCA. In the EIS, we evaluate a range of alternatives with different levels of lethal and nonlethal take. The impacts of this take on gray whale populations, including on the PCFG, are fully evaluated to allow for comparisons between the alternatives.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Alternative 7: Alternative 7 would permit the killing of up to 16 PCFG gray whales with a subquota of eight female PCFG whales over the 10-year waiver period (SDEIS at 10) or an average of 1.6 PCFG gray whales per year. Presumably NOAA/NMFS is promoting this mortality limit strategy over using PBR to control the numbers of whales killed (as is used in Alternatives 2-6), to be more precautionary. I agree that this approach is more precautionary than Alternatives 2, 3, and 6 which permit up to 5, 4, and 3.5 PCFG gray whales to be killed annually, respectively. SDEIS at 45. It is not, however, the most precautionary of the alternatives regarding PCFG gray whales. That distinction goes to Alternative 4 and 5 which would limit PCFG gray whale hunt mortality to a maximum of 1 per year but with the likely killing of 1 PCFG gray whale every 2 years under Alternative 4 and 1 PCFG gray whale every 4 years under Alternative 5. SDEIS at 45. While NOAA/NMFS concedes that Alternative 7 would have a greater impact on PCFG gray whales than Alternative 4 or 5, it provides no explanation as to why permitting a larger number of PCFG gray whales to be killed per year is justifiable. This is of particular concern given the small numbers of PCFG gray whales, their documented decline since 2015, their importance as a bridge population should ENP gray whales and/or their habitat continue to decline in number or quality, and since PCFG gray whales may – or do – qualify to be designated as a management stock. Disclosure of such information is essential both to comply with NEPA and to ensure that interested stakeholders can consider such a justification in preparing substantive comments.	
			NOAA/NMFS has failed to disclose sufficient information about the methodology for collection of gray whale photographs for identification purposes for PCFG and WNP gray whales or as to the status of photo-id catalogs, particularly for WNP gray whales: NOAA/NMFS proposes to treat any whale killed during a summer whaling season as a PCFG gray	Alternative 7 is based on the proposed regulations as modified by the ALJ's Recommended Decision. It is not clear why the commenter believes the SDEIS is inconsistent with the proposed rule, which specifies how whales will be accounted for during both

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			whale (unless the whale is affirmatively identified as a WNP gray whale). During the winter/spring season, however, to determine if a landed whale is a PCFG whale, “observers would photograph the whale and provide those photographs to NMFS and the Cascadia Research Collective to compare with the PCFG photo catalog.” SDEIS at 10. This is inconsistent with the proposed rules that would govern the hunt if authorized (84 Fed. Reg. 13604, April 5, 2019).First, the rule specifies that “[f]or every gray whale approached by the whaling crew, the tribal hunt observer will attempt to collect digital photographs useful for photo-identification purposes.” Id. at 13622/13623. In other words, the requirement to secure photographs of the whales, or at least attempt to do so, is for every whale that is approached and not just those who are landed. NOAA/NMFS must correct this error so that the analysis contained in the SDEIS is consistent with the proposed rules. Notably, while the preambular text to the proposed rules indicate that the tribe must allow NMFS officials to take photographs of landed whales, 84 Fed. Reg. 13604, 13610 (April 5, 2019), there is no explicit language requiring that the Makah Tribe, NMFS officials, or other hunt observers take photographs of approached, struck, struck and lost, or landed whales. Considering the importance of the proper classification of approached, struck, stuck and lost, and landed whales as ENP, PCFG, or WNP gray whales the regulatory language must be strengthened to require the collection of photographs to the extent practicable (recognizing that there may be circumstances when photographs cannot be obtained or when photographs that are collected are determined to be unusable). This is an oversight that must be corrected.Second, the proposed rules do not require the collection of genetic information from approached, struck, struck and lost, or landed whales but given the repeated references to “genetics” and “genetic matching” in the proposed rules, it is clear that NOAA/NMFS recognize that such genetic materials could be used for identification. Since genetic	summer/fall (odd-year) and winter/spring (even-year) hunt. While the proposed regulations do not include a requirement to collect genetic data for identification, they do provide that persons designated by NMFS and by the Makah Tribe may "collect,store, transfer, and analyze genetic samples from struck whales." They also specify, as the commenter notes, that the Regional Administrator determine that there are adequate photoidentification catalogs and processes available to allow for the identification of WNP gray whales and PCFG whales. Comments about the catalog methods, structure, and maintenance as well as funding of the catalogs are beyond the scope of this NEPA analysis, which is done to analyze potential impacts of alternatives to inform decision-making. Under the proposed regulations, it would be NMFS' responsibility to ensure the adequacy of catalogs and to oversee the actual comparisons to determine if photographs or other data (e.g., tissue samples) of hunted whales match with a cataloged whale.See Appendix C Responses to Frequent and Substantive Comment #18 -Maintenance of a WNP photo-ID catalog in light of changing U.S.-Russia relations

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			matching is a more accurate methodology (compared to photo-identification for reasons explained below) for correctly classifying whales as WNP and PCFG animals through genetic matching (assuming their genetic material has been previously collected) the proposed rules should be amended to require, at a minimum, the collection of genetic material from landed whales. Ideally, efforts should be made to collect genetic material from all struck and lost whales as well either by removing any material from the harpoon or obtaining a biopsy sample shortly after the whale is struck.Photo-identification is a standard method for identifying gray whales (and other whale species), but it is not foolproof. For live whales, photographs may be blurry or otherwise inadequate for matching purposes or the angle of the image may not be sufficient to ensure an accurate match. Weather conditions (e.g., rain/fog) and sea state can make it more difficult to obtain photographs and/or could render some photographs unusable. The skill of the photographer and the quality of the photographic equipment could also compromise the quality of the photographs. For juvenile gray whales, their markings may change as they age potentially preventing a positive match. For landed whales, if the carcass is landed upside down, it would not be possible to obtain the photographs necessary for matching purposes unless the carcass can be turned over which, for such a large animal, may be difficult. Consequently, while photo-id may be the preferred method (due to simplicity and limited cost) to collect images for classification purposes, genetic sampling is not subject to so many limitations.In that regard, NOAA/NMFS has failed, both in the 2015 DEIS and the SDEIS to disclose important information about the collection of photographs of gray whales for comparison with the photo-id catalogs (both for PCFG and WNP gray whales), the catalogs themselves, and whether there is or will be sufficient funding to continue to collect photographs from both PCFG and WNP gray whales as is required if the Makah Tribe is to be permitted to kill whales. For example,	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			there is no explanation as to the methodology for collecting photographs contained in the 2015 DEIS or SDEIS. Based on information in Calambokidis et al. (2019), it appears that, for PCFG gray whales, there are or have been 21 persons or entities, including the Makah Tribe, who have historically collected such photographs between 1996 and 2017 and each generally operate in a particular PCFG region.46 Some of these participants submit hundreds of photographs each year while others submit far fewer images. For WNP gray whales, it is entirely unclear as to who collects photographs of these whales in Russian waters for inclusion in and/or for matching purposes while, in Mexico, scientists affiliated with the Laguna San Ignacio Ecosystem Project (and perhaps others) collect photographs of whales (potentially both PCFG and WNP gray whales) for matching purposes. It does not appear that those obtaining photographs conduct systematic surveys (i.e., at approximately the same time each year/month), that specific pre-set survey tracts are used, or that data on time spent conducting surveys is reported or considered in the analysis of the data. Instead, the survey effort appears to be more random. The data/photographs collected are immensely valuable to identify new and recruited PCFG and WNP gray whales but the entire range of PCFG and WNP gray whales is not routinely surveyed. Moreover, the lack of data on the time spent conducting the surveys prevents an analysis of gray whales photographed per unit effort which could be valuable in predicting changes in gray whale distribution (perhaps in response to prey distribution and concentration) and/or population trends. The methodology used to conduct such surveys to collect photographs of gray whales for photo-identification purposes must be fully disclosed and analyzed by NOAA/NMFS given the role of photo-id in classifying gray whales if a hunt is authorized. Such an analysis must clearly include, for both PCFG and WNP gray whales in US, Canadian, Mexican, and Russian waters, the following information: • Who conducts the surveys;• Where the surveys are undertaken;• How the	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			surveys are conducted;• How new persons/entities will be recruited to engage in such surveys as existing participants retire or reduce their efforts;• The number of hours spent conducting the surveys by participant, region, and month;• What proportion of the range is surveyed by month and year;• If specific survey tracts are set and used for such surveys, where they are located and how frequently such tracts are surveyed;• Who funds such survey efforts and who will fund these surveys in the future;• What the process is for submitting the photographs for inclusion in the respective catalogs;• Who conducts the photograph matching work;• How quickly photographs can be evaluated to determine if they are of a known whale.This same information must be disclosed if or when genetic material is collected from any whale for genetic matching purposes. Failure to disclose such detailed information would not be consistent with the requirements of NEPA and would raise concerns about the ability of NOAA/NMFS to comply with the photo-id/genetic matching provisions contained in the proposed rules. Regarding the existing gray whale photo-id catalogs, the proposed rules specify that the NOAA/NMFS regional administration is required to ensure that "[t]here are adequate photoidentification catalogs and processes available to allow for the identification of WNP gray whales and PCFG whales" before a hunt can be authorized. 84 Fed. Reg. 13604, 13620 (April 5, 2019) at 50 CFR 216.113(a)(7)(iv). The PCFG catalog is maintained and managed by Cascadia Research. NOAA/NMFS should disclose what financial support is provided to Cascadia research, both at present and in the future, to maintain the catalog and to conduct the photo-id work and how it will ensure that such funding will continue throughout the duration of the waiver if granted.The current status of the WNP catalog is less clear. While NOAA/NMFS explains in the preambular text of the proposed rule that [t]he IWC is currentlyunified WNP catalog and related database to be held under the auspices of the IWC." 84 Fed. Reg. 13604, 13610 (April 5, 2019)	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			citing IWC (2017), according to the IWC Scientific Committee it does not appear that progress has been made in completing this transition. As indicated in its 2020 report, the IWC Scientific Committee reiterated its support for the development of a consolidated photo-identification catalog for WNP gray whales (given that there are presently at least two catalogs) and recommended that every effort be taken to continue the Russian Gray Whale Project which includes the collection of WNP photographs."47 In its 2021 report, the IWC Scientific Committee reiterated its previous recommendation about the creation of a consolidated WNP gray whale photo-id catalog under the auspices of the IWC, but also noted concerns with the efforts.48 Specifically, the Scientific Committee said: facilitating the development of a The Panel (and the IWC Scientific Committee) has repeatedly recommended that a 'joint photo-ID catalogue of western gray whales (together with associated data) be established under the auspices of the IWC. A draft agreement has been shared and all parties involved have agreed in principle to make their photographs, biopsies, and data available under a data-sharing agreement based upon the safeguards incorporated in the IWC's data sharing agreement and guidelines for catalogues. However, despite the agreement in principle, this initiative has made little or no progress over the last few years and remains in the hands of the two oil and gas companies (Exxon Neftegas Limited and Sakhalin Energy).49 Finally, in its 2022 report, the IWC Scientific Committee provides somewhat conflicting statements about the WNP photo-id catalog. First, it states that: Recognising that information derived from the datasets of these two research projects is critical for population assessment, the Scientific Committee of the IWC has highlighted for more than a decade the importance of combining these two photo-ID (and genetic) data holdings. While those involved in western gray whale research and conservation have expected for many years that a common (joint) photo-ID catalogue and database would become available, to be controlled and managed under	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			the auspices of the IWC, this objective has not been met. Clearly, failing to combine the two catalogues works to counter the concept of using all available science (and data) to support conservation.50Nevertheless, despite an apparent failure, despite a decade of recommendations, to create a consolidated WNP photo-id catalog, the IWC Scientific Committee reports that: As a good faith gesture and to partially offset the effects of the aforementioned lack of progress in integrating western gray whale photo-ID data, the 1994-2021 catalogue maintained by the Russia Gray Whale Project (Dr. Alexander Burdin, PI) will be made available via the IWC Secretariat following SC68D.51 It is the intent of the authors to follow the guidelines set out in Olson et al. (2017), including a data availability agreement that facilitates access to the catalogue for Scientific Committee members. As an initial step, the catalogue will be provided to the IWC Secretariat in PDF form, followed in time with more complete sighting information and related digital type-specimen images.52Furthermore, the IWC SC discussed the conservation implications of the termination of the IUCN's Western Gray Whale Advisory Project which was ended recently. Specifically, the Scientific Committee noted that: Considering the WGWAP is no longer being convened by IUCN and the further geopolitical complications caused by the Russian invasion of Ukraine, the Committee discussed potential impacts on the science, and in turn conservation, of WNP gray whales. Three central themes were raised: (1) the possibility that at least some of the work carried out by the WGWAP would be taken up by Minprirody with continued input from some past members of the WGWAP and advisory support from IUCN. Given the Russian invasion of Ukraine, at present it seems questionable that this will happen; (2) the foreign oil and gas companies operating near the WNP gray whale feeding areas off Sakhalin had long funded a research and monitoring programme (2002-2022) but in response to the Russian invasion of Ukraine, these companies ceased their business interests at	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Sakhalin and elsewhere in the country. With that, the Committee expressed concern that industry-funded research on gray whales off Sakhalin will be seriously affected and quite possibly end. This same concern was expressed by the Committee regarding the ability of independent groups, like the Russian Gray Whale Project, to continue conducting research. Scordino raised the issue of how future population modelling, such as that conducted by Justin Cooke et al., would be handled if the traditional sampling effort (industry plus Russian Gray Whale Project) is disrupted. By way of example, he mentioned that sensitivity tests on estimates of abundance, in terms of accuracy and precision, may be necessary. It is possible that no research on WNP gray whales occurs in summer 2022 and beyond, making future population modelling impossible; and (3) in light of the geopolitical implications caused by the Russian invasion of Ukraine, the Committee expressed great concern that conservation actions and especially international collaborative scientific studies in Russia, including those related to marine mammals will be seriously compromised and permanently damaged and result in intractable consequences on population assessment.53 NOAA/NMFS failed to disclose any of this information in the SDEIS despite its direct implications to any proposed hunt given, particularly, the requirement that an adequate WNP gray whale photo-identification catalog be available before any hunt can be authorized. It does not appear that the consolidated WNP gray whale photo-id catalog, which NOAA/NMFS references in the preambular text of the proposed rules, will be developed. Furthermore, given the termination of the WGWAP it is unclear how or who will continue WNP gray whale research, including the continued collection of WNP photographs, into the future. NOAA/NMFS must provide a comprehensive examination of these issues in a revised SDEIS in order to comply with NEPA. Such an analysis must provide an update on the research/monitoring situation in Russia but must also provide the information about the methodology for collecting	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			photographs of both PCFG and WNP gray whales as articulated above. I note that the proposed rules are clear that if such catalogs are not available to use for photo-id purposes, the hunt cannot proceed even if authorized. --- 46 Calambokidis, J., A. Perez, and J. Laake. 2019. Updated analysis of abundance and population structure of seasonal gray whales in the Pacific Northwest, 1996-2017. Final Report to NOAA, Seattle, WA. pp. 1-72. See, Tables 1 and 2, Pages 17 and 18. 47 International Whaling Commission, Report of the Scientific Committee Virtual Meetings, 11-24 May 2020. See page 49.48 International Whaling Commission, Report of the Scientific Committee Virtual Meetings, 27 April-14 May 2021. See page 57.49 Id. at 58.50 International Whaling Commission, Report of the Scientific Committee Virtual meeting, 25 April – 13 May 2022. See page 64.51 According to the IWC Secretariat, one of the two WNP gray whale photo-id catalogs was transmitted to the Secretariat on 14 October 2022. The second catalog, that must be received to prepare a consolidated catalog, has not been received by the Secretariat. The oil and gas companies that possess this catalog have previously indicated that they will not share it as it contains confidential business information.52 International Whaling Commission, Report of the Scientific Committee Virtual meeting, 25 April – 13 May 2022. See page 64.53 Id. at 62/63.	
			<u>NOAA/NMFS has failed to adequately explain its use of mixing proportions to evaluate the impact of the action alternatives on PCFG gray whales:</u> A critical element in the analysis of the impact of the hunt on PCFG and WNP gray whales in the SDEIS are the mixing proportions of whales during the proposed winter/spring and summer months. As noted in the SDEIS and as reflected in the proposed rules, during the summer hunt, all whales approached, struck and landed, or struck and lost, if not determined	NMFS relied on the best available science in determining the mixing proportions of PCFG, OR-SVI, and MUA whales in the hunt area during the winter/spring hunt season. Harris et al. (2022) provide updated PCFG abundance estimates, but report a sampling bias associated with the 2017-2022 mixing ratio estimates. Therefore, they recommend relying on the Calambokidis et al. (2019) mixing

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			to be a WNP gray whale, will be counted as a PCFG gray whale. SDEIS at 63. For the proposed winter/spring hunt, NOAA/NMFS states that "struck whales that cannot be identified will be counted in proportion to the estimated percentage of PCFG whales in the hunt area during the month of the strike." SDEIS at 10 and, see also, 84 Fed. Reg. 13604, 13621 (April 5, 2019). As explained in more detail above, the mixing proportion data used as the cornerstone of assessing the impact of the proposed hunt under Alternative 7 and the other action alternatives in the SDEIS does not meet this standard and a new analysis must be undertaken and made available for review and comment by interested stakeholders to accurately reflect the actual impact of the proposed winter/spring hunt particularly on PCFG gray whales.	proportions, which have been incorporated into the analysis in the FEIS.
			NOAA/NMFS has failed to adequately explain the origins of the PCFG abundance thresholds that would, if met, prevent hunting**:**On another matter related to proposed restrictions on the killing of PCFG gray whales if a hunt is authorized, while I support the inclusion of abundance thresholds for PCFG gray whales below which any hunt would cease, NOAA/NMFS has failed to provide an adequate explanation as to why it selected 192 as the upper abundance threshold.Apparently, NOAA/NMFS selected these thresholds based on the claim that they "represent the lowest population abundance estimates during a recent stable period from which the population has grown in the time series of data from 1996 through 2017." SDEIS at 67. Notably, the 192 that NOAA/NMFS has selected as the upper abundance threshold for PCFG gray whales cannot be found in Table 3-3 so it is unclear as to its origins. If anything, the selection of 192 appears to be somewhat random and absent any sufficient explanation as to its source and why NOAA/NMFS selected that threshold over, for example, 200, 210, or 220. If NOAA/NMFS truly wanted to be precautionary in regard to the management of PCFG gray whales, SDEIS at 62, it would have selected a higher upper abundance threshold for PCFG	The threshold values of 192 and 171 represent the best and minimum (20th percentile) estimates of abundance for the PCFG in 2007. We selected these levels as the low abundance triggers because they are the lowest values estimated for the population during the recent period of stability starting in 2002 (Calambokidis et al., 2017).The comments regarding the alternative thresholds are noted.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			gray whales in order to increase the likelihood that a hunt, if authorized, would end if the PCFG upper abundance threshold (or its corresponding Nmin) could not be met. I strongly encourage NOAA/NMFS to revisit the selection of an upper abundance threshold for PCFG gray whales and to provide, at a minimum, a substantive discussion of the origins of the selected 192 upper abundance threshold in order to comply with NEPA.	
			NOAA/NMFS mischaracterizes the status of the PCFG gray whale population: Regarding the repeated claim by NOAA/NMFS that PCFG gray whale numbers are stable, an analysis of the data contained in Table 3-3 in the SDEIS (page 31) which contains data from Table 11 in Harris et al. (2022) reveals that this claim is not true. Indeed, far from maintaining a stable trend as suggested by NOAA/NMFS, the PCFG population has declined by 18 percent (257 to 212) between 2015 and 2020 (the most recent year for which a PCFG abundance estimate is available); a decline that NOAA/NMFS qualifies as slight. DSEIS at 29. This decline is less than the nearly 24 percent decline in the larger ENP gray whale population between 2016 and 2020, SDEIS at 96 citing Moore and Weller (2021), but an 18 percent decline through 2020 (recognizing that there is no updated PCFG population estimate for 2022) is not indicative of a stable trend.	Subsection 3.4.3.4 of the FEIS describes the best available science on the status of the PCFG, including the abundance and trends.
			NOAA/NMFS has failed to provide any substantive analysis of the UME on gray whales, including PCFG gray whales, or how the Covid-19 pandemic disrupted stranding network operations:Despite asserting in its notice announcing its intent to prepare an SDEIS that it would, among other things, include more information about the ongoing gray whale Unusual Mortality Event (UME) (85 Fed. Reg. 11347, 11348), the analysis of the UME in the SDEIS is basically limited to acknowledging the UME's existence, providing an update on the number of stranded whales, and noting that a team of scientists has been convened to consider the causes of	The declaration national emergency in response to the coronavirus on March 13, 2020, triggered several containment measures to protect human health and safety which varied by state and geographic area. These measures impacted the Marine Mammal Health and Stranding Network as most partners rely on reports of stranded marine mammals from members of the public, local authorities, and other ocean users. These restrictions also affected the level

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			the UME. This superficial analysis of the UME does not satisfy the requirements of NEPA and, therefore, prevents interested stakeholder from fully understanding how the UME affects the impacts of Alternative 7 and the other action alternatives on gray whales. Considering the ongoing UME, if NOAA/NMFS, recognizing the 38 percent reduction in the number of ENP gray whales since 2016, wanted to be precautionary, it would suspend all decision-making processes associated with MMPA waive and NEPA analyses, until the UME expert team completes and publishes its findings as to the causes of ongoing UME or, at least, until there is credible data documenting recovery of ENP and PCFG gray whale numbers. Whether that decline is linked to the current UME is unclear. NOAA/NMFS claims that there is no evidence that PCFG gray whales have experienced a decline as a result of the UME. It also claims that only two known PCFG gray whales have stranded during the UME (at least as of the July 2022 when the SDEIS was published) (SDEIS at 75 citing pers. comm. with J. Calambokidis). This claim may not be correct considering the reported cryptic mortality rate for gray whales and the impact of the Covid-19 pandemic on the operations of stranding networks responsible for responding to reports of stranded marine mammals, including gray whales. According to Punt and Wade (2012),54 strandings only represent approximately 3.9 to 13 percent of gray whale deaths suggesting that 87 to 96 percent of dead gray whales do not strand but, instead, sink to the seafloor. In other words, if two known PCFG gray whales stranded during the UME, another 15 to 50 may have died and sunk. NOAA/NMFS has not taken into consideration this cryptic mortality rate in its analysis, albeit inadequate, of the potential impact of the UME on gray whales, including PCFG gray whales. As the estimated abundance of PCFG gray whales declined from 228 to 212 between 2019 (when the UME was declared) and 2020 (the most recent year with a PCFG abundance estimate),55 this amount of loss would be consistent with the documented cryptic mortality	of response (documentation, confirmation, and sampling) to stranded marine mammals as stranding events often require many hands (e.g., staff, interns, volunteers, law enforcement), working in relatively close proximity to others, and access to public lands. However, beginning in summer 2020—and continuing through 2021—many states temporarily (and in some cases permanently) lifted or eased mandates in response to vaccine availability, downward trends in positive COVID-19 cases, and changing human attitudes. The timing and manner of lifting COVID-19 restrictions was not consistent across the United States, and some states reinstated restrictions as new variants of the virus emerged. We acknowledge that the COVID-19 pandemic impacted our ability to collect data on the ongoing UME. The SDEIS and the FEIS incorporate the available data on the UME (see 3.4.3.1, Strandings) and incorporate this data into the analysis of effects. See also See Appendix C Responses to Frequent and Substantive Comment #19-Ongoing UME.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			rate for gray whales.The reality is that NOAA/NMFS cannot be certain as to the full impact of the UME on PCFG gray whales given the Covid-19 pandemic and its impacts on the work of the stranding networks. What we do know is that, to date, a total of 606 gray whales have been found stranded since the beginning of the UME in 2019.56 While the number of stranded whales has declined since the peak in 2019, they remain above the long-term average.57 For PCFG gray whales, it is entirely possible that more known PCFG gray whales would have been confirmed to be victims of the UME if not for the Covid-19 pandemic which I understand disrupted the normal activities of stranding networks operating along the west coast of the United States and in Mexico and Canada. According to anecdotal information, the pandemic may have impacted reporting rates for stranded gray whales, slowed stranding response team access to gray whale carcasses, reduced the size of stranding response teams (due to Covid-19 required social distancing rules in place particularly during the height of the pandemic), and, in turn, limited the number of biological samples obtained from the carcasses. If stranding response times were impaired, carcass condition could have deteriorated to the point where any photographs taken were not suitable for photo-id use. Alternatively, the carcass could have stranded ventral side up preventing the acquisition of photographs suitable for identification. In those instances, if genetic samples were not taken, could not be taken due to carcass deterioration, or not assessed for a genetic match with existing genetic data available for known PCFG and WNP gray whales, a PCFG and/or WNP gray whale that perished during the UME could have stranded without being affirmatively identified.NOAA/NMFS has failed to disclose any information in the SDEIS as to the impact of the pandemic on the normal operations to visit, assess, and remove samples from stranded gray whale carcasses. Nor has it articulated how such a disruption may have compromised the ability to detect PCFG and WNP gray whales from the over 600 gray whales that are	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			known to have stranded since the UME began, particularly those whales that stranded during the height of the pandemic in 2020 and 2021. For example, no information has been disclosed as to how many of the 606 stranded gray whales were: 1) inspected by stranding network personnel; 2) photographed; 3) stranded in a position permitting acquisition of photographs suitable for photo-id; 4) necropsied; and 5) for those stranded whale carcasses that were sampled, what samples were collected, and what were the results of the analysis). It also didn't disclose which stranded whales (in terms of location – Mexico, California, Oregon, Washington, Canada) were inspected by stranding response network personnel or other experts, how many photographs were submitted to Cascadia Research for photo-id analysis, and/or if any photographs were submitted to whomever is currently maintaining the WNP gray whale catalog. The only information that NOAA/NMFS has disclosed on this matter is that "full or partial necropsies have been performed on just a few of the stranded animals," "stranding network partners often record as much basic data as possible (referred to as Level A data), such as the state of decomposition and condition of the animals, the location of the stranding, and a list of samples that were collected, if any," and that "[s]ome but not all of the stranded whales have shown evidence of emaciation..." SDEIS at 40. NOAA/NMFS must disclose the information identified in the preceding paragraph as well the results of any necropsy data that has been collected so that interested stakeholders can assess what impact the pandemic had on the inspection of stranded gray whales during a UME. In turn, that information would be valuable to evaluate the likelihood that that pandemic prevented the collection of critical information from the vast majority of stranded gray whales that could have further elucidated the impact of the UME on PCFG and WNP gray whales.---------- ---54 Punt A. 			Additional information that is applicable to the analysis of environmental impacts undertaken in the SDEIS: As previously noted, NOAA/NMFS erred in publishing the SDEIS well before Harris et al. (2002) published their report and before NOAA/NMFS published the new data on ENP gray whale population abundance and calf production.58 Those data were largely in line with data collected on gray whales in Mexico's lagoons by scientists affiliated with the Laguna San Ignacio Ecosystem Science Project (LSIESP) and the American Cetacean Society (ACS). According to the findings of the 2022 LSIESP report59 containing a summary of the number and condition of gray whales in Mexico during the winter of 2021/2022, the following information, largely quoted verbatim, is relevant to the analysis in the SDEIS. • The winter of 2022 was the fourth consecutive gray whale breeding season (2019-2022) in Laguna San Ignacio and Bahía Magdalena that was characterized by: 1) very low numbers of calves-of-the-year; 2) increased adult mortality in the gray whale breeding lagoons and aggregation areas of Baja California, and 3) an increase in the percent of "skinny, poor condition" adult whales; The 2022 winter use of Laguna San Ignacio and Bahía Magdalena by gray whales was characterized by low numbers of	The data collected by scientists affiliated with the Laguna San Ignacio Ecosystem Science Project and the American Cetacean Society presented here is consistent with the analysis in the NEPA analyses. It does not provide new information which would change the conclusions of that analysis.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			calves-of-the-year, an increased percentage (19.5 percent) of whales in poor body condition,60 and an unexpected early departure of whales from both areas;61 • Departure times of single whales in 2022 were approximately two weeks earlier than in previous years. Compared to previous winters, counts of females with calves remained low throughout the 2022 winter season, with the highest count of only 18 pairs observed on 10 March 2022. In 2022, gray whales departed from the Bahía Magdalena complex earlier than in previous winters, as was also observed in Laguna San Ignacio in 2022. • The number of single adult whales (males and females without calves) remained relatively constant between 2009 (n=440) and 2021 (n=500), their estimated numbers increased slightly in the 2022 winter. The estimated number of females with calves ranged about 200 pairs from 2011 to 2017, but then their numbers declined significantly beginning in 2018 and continue to remain low (less than 100 pairs) from 2019 through 2022. • Regarding the ongoing UME, while a primary cause has not yet been identified, it is likely that this event may have multiple contributors, including mortality linked to killer whale predation, fishing gear entanglements, vessel strikes, and poor body condition possibly associated with ecosystem changes in sub-Arctic and Arctic feeding areas. Changing environmental conditions in the gray whales' northern feeding areas may be reducing the availability of food during the summer months, necessitating additional searching time to find food. While insufficient prey could contribute to the reduced reproduction and apparent decline in the body condition of some gray whales, disease and environmental stressors (e.g., climate change) cannot be ruled out;62 • Analysis of the boat-based photographs from Laguna San Ignacio obtained in 2022 revealed that the percentage of single whales with good body condition was 43 percent, an increase compared with 42 percent in 2021, and the highest percentage for single whales for the last four years.	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			For single whales, 37.5 percent were in "fair" condition in 2022 compared with 33 percent in 2021. Finally, in 2022, 19.5 percent of single whales were in poor body condition, the lowest since the beginning of the current UME in 2019. The decreasing percentage of whales in "poor condition" suggest that a slow recovery of the whales' condition may be underway since 2020;63 • While females with calves were generally in "good" body condition, it doesn´t mean that breeding females are not being affected by the factors that are reducing the condition of single whales. When a breeding age female is pregnant but does not obtain sufficient food during the summer feeding season, she may not bring her calf to term, and successfully birth and nurse the calf the next winter. Without a calf, these breeding females would be considered single whales and increase the number/percent of "fair" or "poor" body condition single whales observed in the lagoon;64 • Regarding strandings, the greater number of stranded females documented in 2019 to 2020 could be a factor in the overall reduction in the number of calves born each winter since 2018. The number of reported gray whale strandings is likely an underestimate of actual mortalities, because of the differences in detectability, the dimensions of the area where the gray whales are distributed along the Baja California Peninsula, since an undetermined number of dead whales may drift out to sea and do not arrive on the coastal beaches, and the differences in search effort conducted in all areas. In 2021/2022, 12 stranded dead gray whales were found in Laguna San Ignacio, and one stranded adult in Bahía Magdalena. Half of these were extremely skinny, suggesting that they have been unable to find sufficient food during the summer months in the North Pacific and Arctic waters.65 • Regarding WNP gray whales documented in wintering lagoons in Mexico, comparison of photo-identification data from Russia and Mexico have revealed a total of 48 matches of Western gray whales migrating to	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Baja California during the winter breeding season, confirming additional trans-Pacific movements of gray whales between the gray whale populations in the Western and Eastern North Pacific. These included 21 females, 14 males, and 13 whales of unknown sex. In 2022, six whales66 from Western North Pacific were photographed in Mexico; 2 of them in Laguna San Ignacio, and four in Bahía Magdalena-Bahia Almejas, and two of these were documented in Mexican waters for the first time.67 It is unknown if NOAA/NMFS had access to this report prior to published in the SDEIS. The ACS report68 summarized the findings of its shore-based observation of gray whales from Southern California, was not available to NOAA/NMFS prior to the publication of the SDEIS. Nevertheless, the ACS data may be of interest to NOAA/NMFS as it provides further evidence that gray whales continue to be affected by those factors contributing to the current UME. Among the findings of ACS are: • 313 southbound gray whales (compared to 543 in 2018-2019 pre-UME and fifth lowest southbound count) • 814 northbound gray whales (compared to 1,612 in 2018-2019 pre-UME and ninth lowest northbound count) • 28 newborn calves observed during southbound migration (compared to 62 in 2018-2019 pre-UME and fifteenth highest newborn calf count during southbound migration as migration was delayed and more females likely to have given birth • 25 calves observed during northbound migration (compared to 37 in 2018-2019 pre-UME and fifth lowest northbound calf count). These data provide further evidence as to why NOAA/NMFS erred in publishing the SDEIS before publishing its updated abundance estimate and calf recruitment data since the LSIESP and ACS findings confirm what Eguchi et al. (2022) have documented; that gray whale abundance	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			and calf production continue to decline. This data is indicative of a gray whale population that remains adversely impacted by any of the myriad factors/threats (e.g., Arctic ecosystem shift, habitat alteration affecting prey species, density dependent population demographics, climate change/ocean warming, ship strikes, bycatch, contaminants, ocean noise) that may have triggered the ongoing UME. --- 58 Eguchi, Tomoharu, Aimée R. Gray whale stranding records in México, during the 2022 winter breeding season. Rep. Intl. Whal. Commn. SC/68D/CMP/10. Available at: https://www.sanignaciograywhales.org/wp-content/uploads/2022/05/SC_68D_CMP_10-Martínez-et-al-strandings.pdf 66 As indicated, LSIESP has, as of 2022, documented 54 WNP gray whales in the gray whale wintering lagoons in Mexico. This is somewhat confusing as that same number had been reported in XXX. As noted in the SDEIS, "recent satellite tagging data, genetic, and photo-identification matches between Sakhalin, Canada, the United States, and Mexico have identified 54 whales known to travel between the eastern and western North Pacific." SDEIS at 18 citing Lange (2010), Weller et al. (2012), Mate et al. (2015), and Urban et al. (2019). NOAA/NMFS also report that, Cooke et al. (2019) concluded that "45-80% of Sakhalin whales migrate to the eastern North Pacific in the winter." Id. Since LSIESP (2022) reports that six WNP gray whales were photographed in Mexican waters in 2022, including two for the first time, it is unclear if the previous estimate of 54 total WNP gray whales in Mexican waters remains valid or if the total number has increased since 2019. 67 See, Martínez-Aguilar, et al. 2022. 			Permitting hunt training violates the conservation mandate of the MMPA and the impacts have not been sufficiently analyzed as required by NEPA:NOAA/NMFS is proposing to permit the Makah Tribe to engage in hunt training which would include opportunities to conduct practices approaches of gray whales and throw practice harpoons at them (i.e., harpoon like devices with a blunted end that could not pierce the skin of a whale). If Alternative 7 is selected as the preferred action, it permits up to 353 ENP gray whales to be approached (including both hunting and training approaches; recognizing that the majority of approaches will be for training purposes given the restrictions on strikes and unsuccessful strikes) of which no more than 142 can be PCFG gray whales. SDEIS at 11. In addition, the tribe would be authorized to conduct 18 practice harpoon throws "in any month in winter/spring hunt years," SDEIS at 11 and 84 Fed. Reg. 13619/13620 at §216.113(4)(ii), and 12 practice harpoon throws from July through October in summer/fall hunt years. Id. Effectively, while the above-reference numerical restrictions will be in place, training harpoon throws will be allowed year-round every year of the waiver period, except for January to June 30 in odd-numbered years.Allowing hunt training is unnecessary and is violates the overarching conservation and protection mandate of the MMPA as it allows the purposeful harassment or take of hundreds of gray whales, including endangered WNP gray whales, each year. While NOAA/NMFS discounts that potential adverse impacts of such harassment on gray whales used as training tools by claiming, for example, that such impacts will be temporary in nature, SDEIS at 48, it entirely ignores the potential energetic costs associated	The DEIS, SDEIS, and FEIS analyze the non-lethal effects of training under the action alternatives. See Appendix C Responses to Frequent and Substantive Comments #22-Authorization of Training Activities.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			with the chasing (for some whales repeated chasing) of the animal by Makah whaling crews.Considering the feeding ecology of gray whales where the majority of feeding is done in their summer range followed by an extensive period of nearly constant fasting, these animals may live on the nutritional knife's edge. Add to this the ecosystem changes occurring in the Arctic that may be reducing prey density, quality, and concentration as well as the increasing frequent excessive marine heatwave events in the Pacific Ocean which can cause a complete reordering of coastal and pelagic ecosystems, purposefully allowing any activity that could be energetically taxing on gray whales, particularly during the northward migration, could compromise the health and welfare of individual whales potentially increasing mortality rates and/or impacting productivity.Villegas-Amtmann et al. (2015),69 for example, used a bioenergetics model to determine the energy requirements for a two-year reproductive cycle for female gray whales and to predict the consequences of energetic losses under three possible disturbance scenarios. They found that an annual energetic loss of only four percent when a gray whale is pregnant would prevent a successful pregnancy. During the birth year, a pregnant gray whales would wean her calf at a lower mass if she experienced a 37 percent energetic loss. If an adult female gray whale experiences a 30-35 percent energetic loss, she would lack the energy to become pregnant while she would likely die if she experienced a 40-42 percent energetic loss. In a separate study, Villegas-Amtmann et al. (2017)70 used a female bioenergetics model to predict the consequences of energetic loss in WNP female gray whales. Considering the longer migration distance for WNP gray whales either to Mexico or China, they found that the energy requirements for WNP female gray whales were generally 11 and 15 percent higher compared to female ENP gray whales. The modeling output predicted that female "WGW mortality would likely occur at 38 to 40% annual energetic loss" and that "[l]ong-term yearly	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			energy loss of 30% would result in adult female mortality the first year, followed by lower reproductive rates of survivors." Despite evidence about the impacts of disturbance presented during the ALJ proceedings, NOAA/NMFS has failed to disclose information about gray whale bioenergetics or to analyze the impacts of disturbance, including due to hunting or hunt training, to the survival, productivity, and well-being of gray whales in violation of NEPA.While it has been well documented that the Makah Tribe has only killed, legally, a single whale in 95 years, if the United States asserts, as it must to secure approval of a gray whale ASW catch limit from the IWC, that the tribe has a "continuing traditional dependence on whaling and the use of whales," then the Makah Tribe should not need to practice approaching and killing whales. Even if such practice was warranted, NOAA/NMFS should not allow such practice on living animals. Surely another method could be found to permit such practice (i.e., chasing and practice harpooning a towed log, or a towed mechanical device that can dive and surface emulating the swimming behavior of a gray whale). At an absolute minimum, if NOAA/NMFS grants the requested MMPA waiver authorizing the tribe to hunt gray whales, any opportunity for training should be limited to a single season or two at which time the Makah whaling crews should be capable of pursuing and striking a live whale without the need for further practice. Today's gray whales should not have to suffer the harassment, potentially with adverse consequence, and indignity of literally being treated like training dummies because the Makah Tribe, nearly 100 years ago, elected to forego whaling.Notably, NOAA/NMFS does not allow indigenous whalers in Alaska to engage in practice whaling and I am aware of no other federally authorized hunt of marine mammals (or any species for that matter) where a practice season is permitted. Similarly, while the federal government is a strong proponent of hunting and trapping on federal lands and offers a number of unsavory methods of killing animals on its lands (e.g., bear	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			baiting, snaring, bowhunting, steel-jaw leghold traps, denning), it doesn't permit hunters to engage in practice hunting for any species of wildlife (nor do state wildlife agencies).Here, NOAA/NMFS has not provided any rational explanation for the extensive practice opportunities being afforded by the Makah tribe, why they are needed, whether they will continue indefinitely, and their legal justification under the MMPA and/or the WCA. Notably, in its own proposal, the Makah Tribe did not seek an opportunity to conduct practice whaling71 making it unclear as to why NOAA/NMFS has incorporated such training into the terms of Makah whaling should it be authorized. Considering the extent of practice opportunities under the proposed rules as written, which permit training approaches anytime during a calendar year and training harpoon throws any time during an even-numbered year, 84 Fed. Reg. at 13619 (§216.113(4)(i) and (ii)), and will cause the take of an endangered WNP gray whale, a far more comprehensive analysis of this program, including a substantive summary of the need for whaling practice, is required to comply with NEPA.----------69 Villegas-Amtmann, S., L. 			NOAA/NMFS analysis of the predicted impacts of the proposed hunt and hunt related activities is partially contingent on predicting future	Section 3.15.3.2 Weather and Sea Conditions of the FEIS describes the relevance of weather and sea

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			weather conditions which could over or underestimate the actual impacts of a hunt: Much of the analysis of the impacts of a proposed hunt and hunt related activities on ENP, PCFG, and WNP gray whales assessed in the SDEIS is based on the estimated days of hunt related activities, including hunt scouting and hunting, under the action alternatives. The number of days with hunting and hunt related activities varies from 14 under Alternative 4, SDEIS at 46, to 74 (60 during winter/spring hunts and 7-14 during summer fall hunts) under Alternative 7 for an annual average of 37 days over the 10-year waiver period. SDEIS at 46, 84, 86, 87, 88, 89, 90, 91. These estimates were a product of an analysis contained in the 2015 DEIS in which NOAA/NMFS examined meteorological data from the local area to assess the number of days that may be suitable for hunt scouting and whaling and, consequently, the accuracy of the analysis is literally contingent upon the weather. Predicting hunt impacts based on past meteorological data could lead to considerable error, particularly given changing weather patterns tied to climate change. A more precise mechanism to qualify such impacts would be for NOAA/NMFS to consider establishing limits on the number of days during any authorized whaling season during which the Makah Tribe could engage in hunting or hunt related activities (noting my strenuous objection to any allowance for hunt training).	conditions to the analysis. The number of days activities can occur are restricted through the definitions of the hunt seasons and are further restricted through other measures under the action alternatives. Using weather and sea conditions to estimate hunt days provides a useful tool to distinguish between the effects of the various alternatives.
			NOAA/NMFS has failed to fully consider the precedential effect of authorizing whaling by the Makah Tribe: Despite the precedential impact of a gray whale hunt by the Makah Tribe being featured in the opinion issued in Anderson v. Evans (314 F.3d 1006 (9th Cir. 2002), NOAA/NMFS continues to largely discount the likelihood that its issuance of the requested waiver and permits to authorize whaling by the Makah	The precedential effects are considered in Section 4.17, Regulatory Environment Governing Harvest of Marine Mammals. See also Appendix C Responses to Frequent and Substantive Comments #4-Precedential effect of waiver internationally and domestically.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Tribe would have a precedential effect on other tribes to seek similar opportunities. It suggests this is unlikely due to "the complexity of the waiver process, the length of time required to complete the process, and the lack of resulting harvest opportunities." SDEIS at 93. It also continues to claim that the Makah Tribe is the only US tribe that has, in its treaty with the US government, language establishing a treaty right to whaling. SDEIS at vi. This analysis ignores the 9th circuit's decision in Makah Indian Tribe and the United States of America v. the Quileute Indian Tribe, in which the court held, in a case involving a challenge by the Makah Tribe to the boundaries of the Quileute Tribe's usual and accustomed fishing are, that the Quileute Tribe's right to fish as contained in the Treaty of Olympia included whales and seals. Specifically, the court held that: Based on the considerable evidence submitted throughout the lengthy trial, the district court's finding that the Quileute and Quinault intended the Treaty's "right of taking fish" to include whales and seals was neither illogical, implausible, nor contrary to the record. We conclude that the district court properly looked to the tribes' evidence of taking whales and seals to establish the U&A for the Quileute and the Quinault and did not err in its interpretation of the Treaty of Olympia.As the 9th circuit's opinion was issued in 2017, NOAA/NMFS had sufficient time to compile and analyze the treaties with all coastal tribal nations in the US to identify those that include a fishing right and, consequently, how substantial the precedential impact of authorizing Makah whaling could be should any coastal tribe with a treaty that protects its fishing rights may seek to also take whales. Instead, NOAA/NMFS fails to even cite to the Makah Indian Tribe opinion in the SDEIS. In addition, the Wampanoag Tribe of Massachusetts recently expressed its interest in exercising its right to hunt whales. In an article published by civileats.com, it is stated that:Based on the considerable evidence submitted throughout the lengthy trial, the district court's finding that the Quileute and Quinault intended the Treaty's "right of taking fish"	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			to include whales and seals was neither illogical, implausible, nor contrary to the record. We conclude that the district court properly looked to the tribes' evidence of taking whales and seals to establish the U&A for the Quileute and the Quinault and did not err in its interpretation of the Treaty of Olympia.Today, the Wampanoag Tribe retains the right to hunt whale and take injured or beached whales, but they don't exercise that right. "The overreaching state laws and lack of respect of tribal rights played a major role in removing our people from that common practice," says James-Perry (who is the chairman, culture bearer, and historian for the Wampanoag Tribe). And even if they did decide to take up the practice again, the tribe doesn't have the infrastructure to process a 30- or 50-ton whale. But James-Perry hopes that changes soon. "It is my hope to establish a much better system in which we can start to reclaim that tradition."72Considering this information, NOAA/NMFS must take a new look at the potential precedential impacts of it authorizing the Makah to hunt gray whales in order to fully comply with NEPA. --- 72 See, https://civileats.com/2022/02/08/revival-indigenous-subsistence-whaling-inupiaq-makah-wampanoag/amp/Considering this information, NOAA/NMFS must take a new look at the potential precedentialimpacts of it authorizing the Makah to hunt gray whales in order to fully comply with NEPA.	
			NOAA/NMFS has failed to assess the enforcement implications of authorizing the possession, consumption, transport, barter, and sharing of edible and/or sale of non-edible gray whale products: The SDEIS (SDEIS at 11/12 and proposed rules (84 Fed. Reg. 13604, 13620-13621 (April 5, 2019) include a litany of confusing provisions dictating who, when, and where edible and non-edible gray whale products can be possessed, consumed, transported, bartered, shared, and, for non-	Subsection 4.1.1.1, Management and Law Enforcement, provides information on the relative enforcement costs under the various alternatives, providing sufficient information to inform future decisions. If a waiver is granted to the Makah to hunt gray whales, specific regulations regarding the sale or transfer of whale products (including enforcement) would be developed as part of the waiver process.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			edible products, sold. What is missing is any assessment of the enforcement implications of authorizing such activities, particularly when it involves persons who are not enrolled members of the Makah Tribe. For example, if an enrolled tribal member shares edible or non-edible gray whale products within the reservation boundaries with a non-enrolled member, as permitted by the proposed rules, can the non-enrolled person transport the products outside the reservation boundaries? If so, how will that rule be enforced and by whom? Similarly, if an enrolled tribal member who resides outside the boundaries of the reservation shares or barters a non-edible gray whale product (that is not fashioned into a Makah handicraft) with a non-member, which is not permitted by the proposed rules, how will that provision be enforced and, by whom? For non-edible products fashioned into authentic Makah handicrafts and for which a certificate of authenticity has been issued that have been shared, bartered, or offered to sale outside of the reservation, which enforcement authority (tribal, state, or federal) would be responsible for determining, should there be any question of legal possession, transport, or sale, the legality of the handicraft and/or certificate of authenticity? While the international trade in any edible or non-edible gray whale product is not permitted, a provision that NOAA/NMFS does not reference in its SDEIS analysis, there appear to be no geographical restrictions on the possession, transport, sharing, bartering, consumption and/or the sale (for Makah handicrafts) of edible or non-edible gray whale products within the contiguous United States as well as Alaska and Hawaii. Since such gray whale products are currently illegal to possess, transport, consume, barter, share, and/or sell within the United States, if the proposed rules are finalized this could increase the burden on enforcement agencies responsible for enforcing the rules, including any existing or future state	The preferred alternative would limit the use of whale products to ceremonial and subsistence purposes and prohibit the commercial sale or offer for sale of any whale products, except for traditional handicrafts made from non-edible whale parts within the United States.Violations of the regulations implementing any waiver would be adressed by the NOAA Office of Law Enforcement and Makah tribal authorities within thier jurisdiction. We do not anticipate that enforcing the restrictions related to handicrafts and whale products would ovewhelm these enforcement authorities.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			bans on the sale of whale products. NOAA/NMFS has failed to provide any assessment of this impact to enforcement agencies and personnel of its potential authorization of whaling by the Makah tribe in clear violation of NEPA.	
			NOAA/NMFS has failed to comprehensively evaluate the economic impact of the action alternatives: As is commonplace when evaluating the economic impacts of a proposed action in a NEPA document, the analysis is always one-sided examining only the direct and indirect economic costs of the action (in this case the economic costs of authorizing a whale hunt) instead of also considering the economic value of the whales and resources that will be impacted by the action. The analysis in the SDEIS focuses on the costs of the proposed action to tourism, household value of whale products, whale watching, shipping and ocean sport/commercial fishing, and hunt related management and law enforcement. SDEIS at 79. With the exception of assessing the potential impact of a hunt on whale-watching operations, there is no assessment of the hunt's impact on the economic value of the whale him/herself or of other natural experiences and attributes that couldbe adversely impact by the images and sounds generated by a whale hunt.For example, what is the economic value of the serenity experienced when visiting Olympic Coast National Marine Sanctuary or Olympic National Park? What is the economic value of enjoying time with friends and family without the fear of seeing or hearing the killing of a gray whale? What is the intrinsic and aesthetic value of a gray whale enjoying the protections afforded by the MMPA to local residents who could be impacted by the hunt, state residents who care about gray whales, a national public, including those who may never see a gray whale in the wild, or to an international audience who may value merely knowing that gray whales exist and are, at least to date, protected from intentional killing in US waters? What is the value of a PCFG gray whale with a name and history that has been seen by	We disagree. NEPA does not require that every value, whether intrinsic, aesthetic, etc. as described by the commenter, be converted into dollars and cents. The analyses conducted were both qualitative and quantitative, as appropriate, and provide sufficient analyses to understand the impacts of each of the alternatives and allow for comparison between the alternatives.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			tens of thousands of people who have partaken in whale watching tours within the PCFG range and subranges?Whales have value. They have an intrinsic value independent of any utilitarian value imposed on them by humans. They play a role in the proper functioning of the ecosystems they inhabit through nutrient transport, sediment resuspension, carbon sequestration, as prey and in death as their carcasses degrade on the seafloor promoting biodiversity.Whether the value is intrinsic, aesthetic, experiential, ecological, or in some other form, such attributes can be valued – converted into dollars and cents -- so that such values can be integrated into a more holistic assessment of the economic costs of a proposed action. For example, a single bobcat in Yellowstone National Park has an economic value of US$308,105, a figure nearly 1000 times greater than exploitive values of US$315.17 per bobcat trapped or hunted in Wyoming in the same season.73 because of its value to tourism, not if trapped and its pelt sold to the fur industry. A single African forest elephant is estimated to be worth over 1.75 million solely for its provision of carbon capture and sequestration services.74 Sea otters in the eastern North Pacific have been estimated to provide ecosystem services worth an estimated 53.6 million Canadian dollars (38,870,452 USD) annually, far higher to the estimated annual loss they cause to invertebrate fisheries (7.3 million Canadian dollars or 5,293,923 USD).75 And, in the Greater Farallones NationalMarine Sanctuary in California, Hutto et al. (2021)76 analyzed the role of baleen whales, including gray whales, in sequestering carbon within this single sanctuary. They concluded that:Carbon export from the euphotic zone to the deep sea was calculated for each current population (of baleen whales that use the Farallon's National Marine Sanctuary) and ranged from just over 11 MgC per year for minke whales to 1,415 MgC per year for ENP gray whales. The estimated total annual carbon export for baleen whales in the ENP may be as high as 2,899 MgC/year, which is more than the combined annual sequestration via	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			seagrass, salt marsh, and kelp export in the sanctuary. This amount of carbon export and immobilization is equivalent to removing 2,312 passenger vehicles from the road or preventing the burning of over 1 million gallons of gasoline each year. Using the social cost of carbon, baleen whales that likely feed in sanctuary waters provide up to $542,689 in added benefit to society per year through the carbon immobilization potential of whale falls. Incorporating the pre-whaling estimates for the North Pacific stocks of humpback and fin whales brings the annual carbon export to 7,366 MgC/year.In assessing the value of several species of whale off the coasts of Chile and Brazil for the multiple services they provide including whale watching, carbon sequestration, and fisheries enhancement, Chami et al. (2020) estimated that, on average, a single whale is worth 2 million US dollars annually ranging from 165,000 for a minke whale to 4 million for a blue whale.77 While I am aware of no study that estimates the value of a gray whale. Nevertheless, considering the role of gray whales in: benthic feeding; creating seafloor burrows; resuspending sediments to the benefit of seabirds, fish, and marine invertebrates; mixing nutrients; fertilizing their own feeding grounds; mitigating climate change; for whale watching as well as for their intrinsic and aesthetic attributes, these animals have an economic value. If they happened to be named, like many PCFG gray whales, their individual value may be substantially more. Cecil the lion didn't become an international news story because he was a lion who was shot by an American trophy hunter, but, rather, because he had a name, a story, and had been routinely seen by people on eco-safaris. Even if, as NMFS claims, the impact of the proposed whale hunt on whale watching operations will be negligible, it cannot ignore an entire half of the ledger sheet when assessing the economic impacts of the action alternatives as doing so violates NEPA. ----------

			NMFS has failed to comprehensively and objectively assess the cumulative impacts of Alternative 7 and the other action alternatives in respect to all past, present, and reasonably foreseeable future actions including those undertaken by non-US government agencies: NEPA requires that federal agencies evaluate the "effects" of proposed actions on the environment. Effects include those that are direct, indirect and cumulative. 40 CFR 1508.8 (a) and (b). The regulations define "effects" as:	We disagree. The analysis in the SDEIS augments the information in the 2015 DEIS and incorporates Alternative 7. We have compiled the information in the DEIS and SDEIS, and updated as appropriate, within the FEIS making it more accessible to the reader. This includes the information in Subsection 5.1.3.3, Military Exercises, of the FEIS regarding the SOCAL, NWTR, and GOA Complexes operated by the Navy. The impacts to WNP whales are evaluated

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			(a) Direct effects, which are caused by the action and occur at the same time and place. (b) Indirect effects, which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems. Effects and impacts as used in these regulations are synonymous. Effects includes ecological (such as the effects on natural resources and on the components, structures, and functioning of affected ecosystems), aesthetic, historic, cultural, economic, social, or health, whether direct, indirect, or cumulative. Id. A “cumulative impact” means: ... the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time. Id. at 1508.7 While “reasonably foreseeable” are not defined in the NEPA implementing regulations, as disclosed in the SDEIS, NOAA/NMFS consider reasonably foreseeable future actions as those that (1) have already been or are in the process of being funded or permitted future, (2) are described or included as priorities in government planning documents, or (3) are likely to occur or continue based on traditional or past patterns of activity. DSEIS at 94.	under each of the action alternatives. The SDEIS and FEIS consider the need for an incidental take authorization. For example, Subsection 2.3.7.1.1 of the FEIS, notes that under Alternative 7, "in order to receive a permit for a winter/spring hunt, the Tribe must also obtain an Incidental Take Authorization (ITA) under the MMPA for WNP whales." If a waiver is granted and an ITA is needed, there would be additional opportunities for public comment.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			In the SDEIS, as was the case in the 2015 DEIS, NOAA/NMFS has failed to meet this burden (although the cumulative impact analysis in the 2015 DEIS was more robust than contained in the SDEIS). Instead of engaging in a comprehensive assessment of past, present and reasonably foreseeable future actions, it has merely concluded that, as to reasonably foreseeable future actions, gray whales will continue to be hunted, gray whales will continue to be subject to natural mortality, and that gray whales will continue to persist. SDEIS at 106-109. There is no updated analysis of past and present actions nor has NOAA/NMFS engaged in any type of comprehensive review of how past, present and reasonably foreseeable future actions may, individually or cumulatively impact gray whales. This analysis must include all actions NOAA/NMFS has taken in the past, present, or that it will take in the future that may impact gray whales and their habitat. Any ITA or Letter of Authorization issued under the authority of the MMPA to authorize activities within the range of the gray whale that would otherwise be prohibited. Any permit issued for the study or other use of gray whales. It must also include any past, present and reasonably foreseeable future actions that have been authorized by the states of California, Oregon, Washington and Alaska that may impact gray whales or their habitat. In this case, in the 2015 DEIS, NOAA/NMFS references permits to authorize military training exercise in gray whale habitat. 2015 DEIS at 5-10 to 5-17. Each of those permits have now expired so the SDEIS was the vehicle for which NOAA/NMFS should have disclosed if that permits have been renewed and, if so, how military training activities may impact gray whales and their habitat in combination with the proposed hunt. The purpose of a cumulative impact analysis is not to simply state the obvious, as NOAA/NMFS has done in the SDEIS (e.g., that gray whales	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			will continue to persist) or to disclose a list of past, present, and reasonably foreseeable future actions but to engage in a meaningful and credible analysis of how such actions will impact gray whales considering the proposal to authorize a hunt of gray whales. This could be done by, for example, quantifying the individual and cumulative impact of all actions to determine what the likely impacts are to gray whales and their habitat. Alternative, a model could be developed to predict such impacts based on model parameters, the data used to populate the models, and any assumptions inherent to the model. NOAA/NMFS has not met this standard and, consequently, the cumulative impact analysis contained in the SDEIS is invalid.	
			Conclusion: NOAA/NMFS has failed to provide the level of analysis, as required by NEPA, in the SDEIS. The information disclosed was incomplete, some of the analysis was inaccurate, there were multiple instances where the analysis was contradictory to the proposed rules that would govern the hunt, if authorized, and it failed to even address many issues that are directly relevant to the required analysis. During the pendency of the comment period, new information became available that invalidated many sections of the analysis effectively rendering the SDEIS as meaningless. NOAA/NMFS prematurely published the SDEIS perhaps to meet a self-imposed deadline even though critical information cited in the document was unavailable and despite knowledge that other information, demonstrating a further decline in ENP gray whale abundance and calf production was in preparation.Considering these deficiencies, NOAA/NMFS must withdraw the SDEIS and: 1) begin anew with a goal of preparing a more comprehensive, transparent, and up-to-date analysis of the full suite of impacts of the action alternatives on ENP, PCFG, and WNP gray whales; 2) terminate all decision-making processes related to this matter given the ongoing decline in ENP, PCFG (and potentially WNP	These concluding comments are noted.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			gray whales); or 3) suspend these decision-making process until NMFS understands and has taken action to mitigate the causes of the UME, reassess the stock status of PCFG gray whales, and complete the ITA process before reinitiating any NEPA analysis.Thank you in advance for considering these comments. Should you have any questions or need anyadditional information, please contact me at toni@terramarresearch.org.	
492	Ridley, Jim	10/31/22	NOAA's own research shows that the population of the eastern North Pacific gray whale is in a alarming state of decline - https://www.fisheries.noaa.gov/west-coast/science-data/gray-whale-population-abundance https://www.fisheries.noaa.gov/west-coast/science-data/gray-whale-population-abundance#:~:text=Current%20Population%20Size,-In%202016%20we&text=The%20impact%20of%20this%20UME,the%20winter%20of%202021%2F2022. This is a species that is threatened - and without federal protection - might be extinct in less than a century. Extinction is not a favorable outcome for the waters of the Pacific Northwest. With the passing of the last of this species, a change will come that will be historic, if not catastrophic to the Pacific Northwest. From NOAA - "Gray whales serve as ecosystem sentinels, alerting us to possible changes in the environment. The Arctic, where the primary feeding areas for gray whales are located, is changing rapidly. These changes, which include reductions in the distribution and persistence of Arctic sea ice, affect the availability of gray whale prey and have been linked to changes in gray whale distribution." I respectfully oppose the request by the Makah tribe to resume their right to hunt the eastern North Pacific gray whale. I understand that this is a	The stock of ENP gray whales is not considered threatened. See FEIS Subsection, 3.4.3.3 Eastern North Pacific (ENP) Gray Whale. See also Appendix C Responses to Frequent and Substantive Comments #19-Ongoing UME. See also Appendix C Responses to Frequent and Substantive Comments#14-Cumulative effects and the future health of the ENP gray whale population in the face of climate change and other threats.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			right granted to the tribe by The Treaty of Neah Bay (1855) but I think all parties have a greater obligation to respect the rights of the gray whales to continue to exist - and maybe flourish - without the threat of mankind to their habitat and their numbers.	
493	Ker, B	10/31/22	THE MAKAH, JUST LIKE EVERY OTHER AMERICAN SHOULD NOT BE KILLIGN WHALES ANYMORE WHALES ARE IN TERRIBLE DECLINE. NOBODY SHOULD BE GETTING ANY AUTHORIZATION TO KILL WHALES. DONT CARE WHAT CUSTOMS ARE. YOU HAVE TO GROWUP AND UNDERSTAND THE PRESENT SITUATION OF THIS EARTH, WITH ITS DECLINING WHALE POPULATIONS. THIS COMMENT IS FOR THE PUBLIC RECORD. PLEASE RECEIPT B KER	See FEIS section 3.4.3.3 Eastern North Pacific (ENP) Gray Whale. See also Appendix C Responses to Frequent and Substantive Comments #19-Ongoing UME.
494	Kelly, Amanda	10/31/22	The goal of this comment is to argue in support of the agency's preferred action sub-alternative threshold, 7(c). This sub-alternative would set the low abundance threshold for Eastern North Pacific (ENP) gray whales at 18,000 individuals. This upper value of the population threshold metric is the most prudent course of action because it would lead to the most minor effect on ENP gray whale abundance. Therefore, as a component of the proposed action plan, 7(c) is essential to manage ENP gray whale populations effectively. The SDEIS states that the probability of ENP thresholds being triggered cannot be predicted (page 73); however, it can be assumed that future threats to ENP abundances will increase with climate change and other oceanic disturbances and would impact threshold triggers. For example, a recent study by Torres et al. (2022) examined the effect of changing environmental conditions on prey resources or nutrient availability as measured by grey whale body mass. Over the course of their study from 2017-2019, gray whale body condition deteriorated. The researchers suggest the timing of the most recent UME coincides with the decline in body condition. Furthermore, body mass and nutrient availability impact growth, survival, and reproduction and fundamentally	The DEIS, SDEIS, and FEIS consider the future threats to gray whales in Chapter 5-Cumulative Effects. Comments regarding an abundance threshold are noted.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			influence population numbers. A review of current literature on grey whales concluded that "...our knowledge of its health and disease, and resilience..." is yet limited Stimmelmayr & Gulland, 2020, page 7). This last point is relevant as it could explain why so little is understood about the recent increase in single-stranding events. The discussion of population thresholds in the SDEIS involved significant use of past population abundances to select threshold numbers. While common practice among researchers to look at historical data, the retrospective analysis does not factor in the near-future impacts of increased exposure to harmful algal blooms or changing habitats from climate change (Stimmelmayr & Gulland, 2020). Simmonds and Elliot (2009) compiled a list of "precautionary and adaptive management" responses to threats experienced by natural systems from climate change, which was taken from Hansen et al. (2003). Their suggestions include limiting non- climate-related stressors and incorporating adaptive management. The latter is vital, given that the impacts of climate change on cetaceans are uncertain. While sub-alternative 7(c) may limit the number of harvestable whales at some point in the future, it would more fully account for the future impacts on ENP whale populations from environmental change and oceanic disturbances. Furthermore, the higher threshold would minimize the potential impacts of unforeseen factors, including social-environmental ones. For example, when the Makah first gained approval to hunt whales, only 14% of Americans supported whale hunting (Beldo, 2019). This partly explains the controversy that occurred in its aftermath. In more recent polls, the percentage of support for the protection of whales has increased. In 2021, Pew data demonstrated that an overwhelming majority (roughly 88%) of East Coast residents supported the protection of threatened whales. Unfortunately, there is no readily available equivalent statistic for ENP gray whales. Given the vast uncertainty about broader social-environmental impacts, the most conservative threshold would	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			minimize unforeseen long-term effects on this indicator and stands as the best course of action. Finally, sub-alternative 7(c), although at times more restrictive, would still honor the treaty rights to which the Makah Tribe is entitled. As such, it strikes the most conservative balance among the options. --- References Beldo, L. (2019). 498	Poulsen, Peter	11/03/22	I support the Makah tribes request to hunt whales as is their right under treaty with the US government	Comment noted.
499	Ridley, Catherine	11/03/22	I strongly object to issuing a waiver that would permit hunting of North Pacific gray whales off the coast of Washington State. Whale populations are declining worldwide. Climate change and other human-induced environmental stressors pose an ongoing and increasing threat to marine species that warrants continued aggressive protection of all whale populations.	See FEIS Subsection 3.4.3.3, Eastern North Pacific (ENP) Gray Whale. See also Appendix C Responses to Frequent and Substantive Comments #19-Ongoing UME.
500	Branch, Mary	11/02/22	Regarding the Makah Tribe request to hunt gray whales, I would like to register my strong opposition to granting this waiver of the MMPA. The MMPA was established for a very good reason, and NOAA's duty is to uphold this Act, not continually grant waivers or IHAs on the Act. Whales globally are in decline and the soon gray whales will join the ranks of the Orcas, Right Whales who are critically endangered and close to extinction in our lifetime. NOAA's own findings on the alarming plight of gray whale population declines, published October 7, 2022 can be found here: https://www.fisheries.noaa.gov/feature-story/gray-whale-numbers-continue-decline-noaa-fisherieswill-continue-monitoring?utm_medium=email&utm_source=govdelivery As a citizen, taxpayer and whale advocate, I do not understand how you can document this very alarming situation on gray whales, merely continue to "monitor" the situation, yet grant a waiver to let a specified group or organization or corporation contribute to the decimation of these animals. Your own data states that the decline in since 2015-2016 has been almost 40%. That is an alarming rate in the last 4 years! The Makah Tribe's treaty was back in 1855. Are you kidding me? 1855?? This should not be applicable in any way, shape or form in 2022. The decline in gray whale calf births, the changing climate which affects our ocean marine life and contributes to decline in food for these animals, temperature changes that affect their health, increased vessel strikes, entanglements, pollution and increase in	See FEIS Subsection 3.4.3.3, Eastern North Pacific (ENP) Gray Whale. See also Appendix C Responses to Frequent and Substantive Comments #8-The Treaty of Neah Bay. Chapter 5 of the FEIS discusses cumulative impacts. See also Appendix C Responses to Frequent and Substantive Comments #14-Cumulative effects and the future health of the ENP gray whale population in the face of climate change and other threats.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			toxicity levels of our oceans are all contributing to their declines. Now you want to give a tribal group a license to kill them. It makes no sense, and in fact is a very barbaric and inhumane practice. Here the U.S. and other countries are banning whale hunting in an effort to save these creatures, yet you are finding a loophole for an ancient Treaty for one singular Tribe to hunt whales. I strongly ask that you reject granting this waiver, take us in to the 21st century with sound environmental practices and regulations based on science, not a Treaty over 150 years old! Please!	
501	AWI	11/5/22	On behalf of the Animal Welfare Institute (AWI), I submit the following comments on the Supplemental Draft Environmental Impact Statement on the Makah Tribe Request to Hunt Gray Whales (SDEIS), which purports to analyze additional information relevant to the Makah Tribe's request for a waiver of the Marine Mammal Protection Act's (MMPA) take moratorium to conduct ceremonial hunts. 87 Fed. Reg. 39,804 (July 5, 2022). The SDEIS relied on outdated data, failed to consider a number of viable alternatives, and the process by which it was produced deprived outside experts and other interested parties of the opportunity to fully analyze and address the new data made available just days before the end of the extended comment period (October 14, 2022).1On February 27, 2020, the National Marine Fisheries Service (NMFS) published a Notice of Intent to prepare the SDEIS, noting that the analysis would include, among other things, information about the ongoing gray whale Unusual Mortality Event (UME). 85 Fed. Reg. 11,347, 11,348 (Feb. 27, 2020). However, the SDEIS did not provide any meaningful analysis of the UME. To the contrary, the SDEIS's glaring deficiencies, including NMFS's failure to timely disclose critical information, prevented both the agency and interested stakeholders from fully reviewing and assessing the environmental impacts of the proposed action and its alternatives. Consequently, the SDEIS violates the National Environmental Policy Act (NEPA), 42 U.S.C. §§ 4321-4370m, and its implementing regulations, as well as the Administrative Procedure	See response above.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Act (APA), 5 U.S.C. § 706(2).2As discussed below, as well as in various comments submitted as part of the MMPA and NEPA processes, NMFS's proposed waiver and regulations eschew the conservative, precautionary approach that the MMPA demands and, instead, prioritize the interests of the Tribe over marine mammals. Gray whales are facing ongoing and increasing threats, including from ship strikes, bycatch, contaminants, ocean noise, and ocean warming, including localized and regional marine heatwaves. NMFS itself recognizes the precarious situation facing each recognized subpopulation. Indeed, the Western North Pacific (WNP) gray whales remain listed as endangered under the Endangered Species Act (ESA). The Eastern North Pacific (ENP) gray whale and Pacific Coast Feeding Group (PCFG) gray whale populations continue to suffer steep declines in abundance and, for ENP gray whales, calf production due to the multiyear, ongoing UME, the cause of which remains unknown. Additionally, questions remain regarding the appropriate designation of the PCFG gray whale management unit under the MMPA. Unfortunately, NMFS's flawed, results-oriented decision-making in this matter has carried through to the NEPA process, resulting in an SDEIS that ignores important data and violates NEPA's requirements in several crucial respects. Accordingly, the SDEIS is arbitrary, capricious, and not in accordance with law. These flaws must be corrected before any final decision can be issued.As it did in its comments on the Recommended Decision, AWI again feels compelled to point out its strong organizational commitment and dedication to environmental justice and civil rights matters generally and Native sovereignty issues specifically. While AWI fully appreciates the Tribe's unique cultural heritage and its interest in hunting gray whales, at this time AWI does not view such a hunt as consistent with the best available science regarding the various gray whale populations that could be affected by the proposed hunt, nor the precautionary principle embodied in the MMPA. Nor does AWI view the SDEIS process as taking the legally	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			required "hard look" at the impacts of the proposed hunt or its alternatives, as required by NEPA. Accordingly, AWI submits these comments through a law- and science-focused lens that is in no way intended to demean or diminish the Tribe's interests in engaging in important cultural practices. --- 1 Following the close of the comment period, NMFS announced a brief reopening of the comment period, setting a new deadline of November 3, 2022. 87 Fed. Reg. 64,454 (Oct. 25, 2022). AWI intends this comment letter to update and supplant the letter it submitted on October 14th. AWI incorporates by reference its comments on the Recommended Decision, as well as comments submitted on the 2015 Draft EIS, and declarations and briefs submitted during the MMPA waiver process.2 In 2020, the Trump Administration issued sweeping changes to NEPA's implementing regulations that apply only to NEPA processes "begun after the effective date" of September 14, 2020. 85 Fed. Reg. 43,304, 43,339 (July 16, 2020). The SDEIS was prepared pursuant to the NEPA regulations in place at the time of NMFS's 2015 Draft EIS (DEIS) for the proposed hunt. See SDEIS at iv. Accordingly, the citations to NEPA regulations in this comment letter likewise refer to the NEPA regulations in place prior to the 2020 Final Rule.	
			STATUTORY BACKGROUND3 Congress enacted NEPA more than four decades ago "[t]o declare a national policy which will encourage productive and enjoyable harmony between man and his environment; to promote efforts which will prevent or eliminate damage to the environment." 42 U.S.C. § 4321. In light of this mandate, the Supreme Court has reasoned that NEPA is "intended to reduce or eliminate environmental damage and to promote 'the understanding of the ecological systems and natural resources important to' the United States." Dep't of Transp. v. Pub. Citizen, 541 U.S. 752, 756 (2004) (quoting 42 U.S.C. § 4321).	See response above.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			To achieve NEPA's substantive goals, Congress created two specific mechanisms whereby federal agencies must evaluate the environmental and related impacts of a particular federal action—an Environmental Assessment (EA) and an EIS. See 42 U.S.C. § 4332(c). These procedural mechanisms are designed to inject environmental considerations "in the agency decision-making process itself," and to "help public officials make decisions that are based on understanding of environmental consequences, and take actions that protect, restore, and enhance the environment." Pub. Citizen, 541 U.S. at 768-69 (quoting 40 C.F.R. § 1500.1(c)). Therefore, "NEPA's core focus [is] on improving agency decision-making," Id. at 769 n.2, and specifically on ensuring that agencies take a "hard look" at potential environmental impacts and environmentally enhancing alternatives "as part of the agency's process of deciding whether to pursue a particular federal action." Balt. Gas & Elec. Co. v. NRDC, 462 U.S. 87, 100 (1983). The alternatives analysis "is the heart" of an EIS or EA. 40 C.F.R. § 1502.14. NEPA's implementing regulations require that the decision-making agency "present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decision-maker and the public." Id. To assist in NEPA's twin aims of ensuring that agencies "consider every significant aspect of the environmental impact of a proposed action" and "inform the public that it has indeed considered environmental concerns in its decision-making process," id., an EIS must "provide full and fair discussion of significant environmental impacts" and must "inform decision-makers and the public of the reasonable alternatives which would avoid or minimize adverse impacts or enhance the quality of the human environment." Id. § 1502.1. Importantly, the NEPA process	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			"shall serve as the means of assessing the environmental impact of proposed agency actions, rather than justifying decisions already made." 40 C.F.R. § 1502.2(g) (emphasis added); see also id. § 1502.5 (requiring that NEPA review "shall be prepared early enough *so that it can serve practically as an important contribution to the decision-making process and will not be used to rationalize or justify decisions already made*" (emphases added)). --- 3. In light of the extensive comments AWI has submitted at various stages of this decision-making process, AWI feels it unnecessary to discuss the factual background in depth. Additional relevant facts are incorporated into the discussion throughout.	
			DISCUSSIONA. The SDEIS Process Suffered from Procedural Irregularities That Deprived <u>Commenters of Timely Access to Critical Information</u>. Although AWI appreciates NMFS's initial grant of a 60-day extension of the comment deadline, 87 Fed. Reg. 50319 (Aug. 16, 2022), the agency's subsequent denial of an additional extension to review newly released materials bearing directly on the issues of gray whale abundance and the impacts of the UME is particularly troubling. Shortly before the comment deadline, NMFS published several papers that contain information vital to an accurate assessment of the proposed hunt and its environmental impacts. For example, one paper contained a revised abundance estimate for PCFG gray whales, see Harris et al. (2022),4 while other papers contained a revised ENP gray whale population abundance estimate and new gray whale calf production numbers, see Eguchi et al. (2022).5 Despite the belated release of these studies that NMFS knew were in the process of being finalized during the SDEIS process—indeed, reports concerning the revised ENP gray whale abundance estimates and calf production were posted on NMFS's website a mere seven days before the SDEIS comment deadline—NMFS denied AWI's request for a second,	See response above.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			limited extension to allow it time to review and incorporate the new data into its comments. As a result, AWI's ability—and indeed, that of all stakeholders—to review and address the reports was compromised. NMFS's decision is particularly troubling given the fact that these reports document an ongoing, dramatic decline in ENP gray whale abundance estimates, as well as the lowest number of northbound gray whale calves since counts were initiated in 1994. Such information is directly relevant to the subject matter and analysis contained in the SDEIS. Yet, AWI and other stakeholders were denied sufficient opportunity to review and incorporate the data into their comments.NMFS's failure to provide timely access to the reports is likewise troubling because NMFS issued its SDEIS a mere three months before the updated gray whale abundance report was finalized. See 87 Fed. Reg. 39804; Harris et al. (2022). Rather than wait to ensure that the SDEIS contained the most accurate and updated information available—which NMFS knew was "in prep[aration]" and would be finalized shortly—NMFS once again barreled ahead and issued its SDEIS based on outdated information, compromising the integrity and accuracy of the decision-making process. The agency's failure to disclose such information that goes to the very heart of the decision under review—i.e., whether to waive the MMPA's moratorium and allow a hunt for individuals of the declining ENP gray whale population—deprived interested stakeholders of a sufficient opportunity to review, analyze, and incorporate highly relevant information into their substantive comments. This lack of transparency violates the information disclosure requirements of NEPA and is a major flaw with the SDEIS. --- 4. J. Harris et al., NOAA Fisheries, Recent Trends in the Abundance of Seasonal Gray Whales (Eschrichtius robustus) in the Pacific Northwest, 1996-2020, AFSC Processed Rep. 2022-05 (Sept. 2022).5. Tomoharu Eguchi et al., NOAA Fisheries, Abundance and Migratory Phenology of

			Eastern North Pacific Gray Whales 2021/2022, NOAA Technical Memorandum NMFS-SWFC-668 (Sept. 2022).	
			B. The SDEIS is Woefully Inadequate and Fails to Satisfy the Requirements of NEPA. NEPA requires agencies to ensure that the information they use is "of high quality." 40 C.F.R. § 1500.1(b). Indeed, "[a]ccurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA." Id. The SDEIS fails to meet this requirement. First, despite the fact that two of the SDEIS's preparers were also named authors of the paper reporting the revised ENP gray whale abundance estimates—which again, was not only in the process of being finalized while the SDEIS was being prepared but was released a mere seven days before the SDEIS comment deadline—NMFS inexplicably elected to rely on outdated 2020 abundance estimates in the SDEIS, skewing its analysis. Since 2016, the ENP gray whale population has declined by 38%, and calf production last year was at its lowest since scientists began counting births in 1994. The 2022 abundance estimate now sits at a mere 16,650 whales. Not only is this nearly 4,000 fewer whales than the population estimate relied upon in the SDEIS's analysis, it is also below the abundance estimate when gray whales were delisted under the ESA (i.e., 20,000-21,000 whales). 58 Fed. Reg. 3121, 3125 (January 7, 1993). Given the low calf production and the ongoing UME, this decline may to continue. The PCFG gray whale population has likewise experienced an 18% decline from an estimated high of 257 in 2015 to 212 in 2020 (the most recent year for which a PCFG abundance estimate is available). Although the SDEIS briefly discussed the impacts of setting a "low abundance trigger" on the hunt—i.e., an abundance estimate below which the hunt would not occur—NMFS did not meaningfully examine the impacts of conducting a hunt on	See response above. Footnote 11 was not included in the October 14, 2022, letter. The NEPA analysis discusses and evaluates the training activities that will have environmental impact (e..g., training approaches, training harpoon throws, and vessel operations associated with training activities) in detail and allows for comparison of the alternatives. . In addition, it describes in sufficient detail for the analyses the certification and training of Makah whalers (see, among others, Subsections 2.3.2.2.12, Other Environmental Protection Measures; 3.4.3.1.1, Training and Weapons Improvement; 3.14.1.1, Weapon Safety Regulations and Authorities).

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			a population that is undergoing a dramatic decline. For example, although NMFS dismissed the impacts of non-lethal approaches or strike attempts on individual whales as being "temporary," NMFS did not take a hard look at how those takes will impact whales, both individually and cumulatively with other stressors, including declining food availability, climate change, and pollution. Indeed, given the additional energy expenditures of responses elicited by any take, whether lethal or non-lethal, it is likely that such takes will have a serious adverse impact on malnourished or otherwise compromised individuals.6 Yet, NMFS never examined such effects. Because the SDEIS relied on outdated data despite the availability of updated data that bear directly on the environmental consequences of the action, and further, because the reliance on outdated data skewed the agency's analysis and masked adverse impacts, the SDEIS violates NEPA and its implementing regulations. Relatedly, NMFS failed to examine the impacts of the hunt relative to PBR in light of the revised abundance estimates and negative population trend data. PBR is intended to determine the maximum number of animals that can be removed from a population or stock as a result of human-caused mortalities (not natural mortalities) while allowing the population or stock to reach or maintain its optimum sustainable population (OSP). SDEIS at v. Given the precipitous decline in the ENP and PCFG gray whale populations, NMFS must revisit the other variables used in the calculation of PBR, including Rmax and the recovery factor, to determine whether the variables must also be revised.7 Indeed, for declining populations, the precautionary principle dictates that a more conservative Rmax be used to ensure that human-caused mortalities are not contributing to a population's failure to maintain OSP. Likewise, where a population is in danger of falling below OSP, the recovery factor of 1.0 may not be appropriate. Determining an accurate and biologically justifiable PBR is essential to	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			achieving the MMPA's purposes, and is especially critical where, as here, evidence suggests an increase in human-caused mortalities in a population as a result of, for 6 Villegas-example, ship strikes,8 bycatch,9 and ongoing subsistence harvest.10 NMFS must rigorously examine the direct, indirect, and cumulative impacts of the proposed hunt, including all of the best available data regarding population trends, sources of human-caused mortality, and the impacts of climate change on gray whales. NMFS's failure to conduct such a robust analysis, either in the DEIS or the SDEIS, violates NEPA's hard look requirement. Second, the SDEIS failed to fully examine the impacts of the UME on the ENP and PCFG gray whale populations. Although the causes of the UME have not yet been determined, available evidence suggests that the increased mortality of gray whales is due in part to decreased food availability in the Arctic, which in turn is linked to climate change. The SDEIS dismisses the UME as merely a population fluctuation typical of a boom/bust cycle, but the year-over-year decline in abundance since 2016 is strongly suggestive of a larger trend. NMFS failed to examine this potential. Instead, NMFS remained myopically focused on dismissing the impacts of the proposed hunt, insisting that its cursory assessment of "low-impact triggers" for ENP and PCFG gray whales suffices for an examination of the actual impacts of the proposed hunt on a declining population. In so doing, NMFS ignored an important aspect of the problem, and failed to take the requisite hard look at the effects of its action. NMFS must take a hard look at the impacts of the proposed hunt and its alternatives—direct, indirect, and cumulative—in light of the long-term impacts of the UME and its causes on gray whale abundance. Third, the SDEIS failed to fully examine the direct, indirect, and cumulative impacts of take on ENP, PCFG, and WNP whales. The SDEIS	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			suffers from the same fatal flaw as the Recommended Decision, i.e., it presumes without evidence that the effect of takes by approach or pursuit will have only a temporary effect on WNP whales. However, as previously explained in AWI's comments on the Recommended Decision, vessel approaches to within 100 yards are known to have the potential to cause behavioral disturbances and thus have long been formally considered by NMFS to constitute harassment. Moreover, at the administrative hearing, when asked to describe gray whales' reaction to being approached by research vessels, Dr. Weller admitted not only that many whales do in fact react, but that such reaction "is often related to the behavior of the boat and how it is operated." Tab 102, 10:10-14. Thus, it stands to reason that a gray whale that has been targeted by Tribal hunters and subjected to an approach and pursuit in a hunt scenario may react quite strongly. As a result, NMFS's SDEIS failed to take a hard look at this critical aspect of the proposed hunt, and as such violates NEPA, its implementing regulations, and the APA. NMFS's failure to take a hard look at the impacts of take on gray whales is particularly egregious with respect to the endangered WNP gray whale. The SDEIS erroneously focuses only on the potential of a WNP whale being lethally struck. However, as explained, even so-called "temporary" disturbances can have serious adverse impacts on whales, including energy expenditures, disruption or abandonment of important life history behaviors, and stress, all of which could impact the long-term viability of individuals and even the stock itself. Indeed, Villegas-Amtmann et al. (2017) (Attach. 2) used a female bioenergetics model to predict the consequences of energetic loss in WNP female gray whales. Considering the longer migration distance for WNP gray whales either to Mexico or China, they found that the energy requirements for WNP female gray whales were generally 11-15% higher than those of female ENP gray	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			whales. The modeling output predicted that female WNP "mortality would likely occur at 38-40% annual energetic loss" and that "[l]ong-term yearly energy loss of 30% would result in adult female mortality the first year, followed by lower reproductive rates of survivors." NMFS's SDEIS fails to meaningfully discuss gray whale bioenergetics or analyze the direct, indirect, or cumulative impacts of sub-lethal take on WNP gray whale individuals or on the stock as a whole, thereby minimizing the potential adverse effects of the proposed hunt on the endangered species. As a result, the SDEIS violates NEPA, its implementing regulations, the MMPA, and the APA. Finally, the SDEIS failed to examine all reasonable alternatives. Specifically, the SDEIS failed to examine the mid-range alternative of conducting a hunt without authorizing any training activities on live whales. This alternative would accomplish the purpose and need for the action while also reducing the adverse effects on ENP, PCFG, and WNP gray whales and the marine environment. Yet, NMFS never meaningfully examined such an alternative either in the DEIS or in the SDEIS.11 "The existence of a viable but unexamined alternative renders an [EIS] inadequate." Westlands Water Dist. v. U.S. Dep't of Interior, 376 F.3d 853, 868 (9th Cir. 2004) (quotation omitted). It is particularly troubling here that NMFS failed to consider any alternatives that "might meet the goals of the agency by using different approaches which may reduce the environmental impacts of the agency's action." Soda Mountain Wilderness Council v. Norton, 424 F. Supp. 2d 1241, 1265 (E.D. Cal. 2006). Notably, to our knowledge no other subsistence whale hunt permits "training activities." It is unclear why NMFS has incorporated such training activities into its proposed activity, particularly given the serious adverse impacts of such activities on the affected whales and their	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			constituent stocks. Yet, NMFS never analyzed, either in the DEIS or in the SDEIS, an alternative that would forbid such training activities and allow only the core proposed action, i.e., the hunt. NEPA imposed a clear-cut procedural obligation on NMFS to take a "hard look" at alternatives that would entail less significant impacts on resources affected by the project. Balt. Gas, 462 U.S. at 100. An EIS must "[r]igorously explore and objectively evaluate all reasonable alternatives" and, in particular, "should present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decision-maker and the public." 40 C.F.R. § 1502.14. NMFS's objectives must take into account "the views of Congress, expressed . . . in the agency's statutory authorization to act." Citizens Against Burlington, Inc., 938 F.2d at 196; see also Theodore Roosevelt Conservation P'ship, 661 F.3d at 72 (defining "reasonable alternative" to mean one that "is objectively feasible as well as 'reasonable in light of [the agency's] objectives'" (alterations in original) (quoting City of Alexandria v. Slater, 198 F.3d 862, 867 (D.C. Cir. 1999))). With respect to marine mammals, Congress mandated that the management of populations be carried out with the interests of the animals as the *prime consideration*. H.R. REP. NO. 92-707, at 18, 1972 U.C.C.C.A.N. at 4145 (emphasis added). Accordingly, a reasonable range of alternatives must include alternatives that have fewer adverse effects on gray whales. Legally and logically, this includes a mid-range alternative that prohibits training activities. NMFS's failure to examine such an alternative and its impacts violates NEPA, its implementing regulations, and the APA. Cf. Union Neighbors United, Inc. v. Jewell, 831 F.3d 564, 577 (D.C. Cir. 2016) ("Accordingly, because the Service in these circumstances did not consider any other reasonable alternative that would have taken fewer Indiana bats than Buckeye's plan, it failed to consider a reasonable range of alternatives and violated its obligation under NEPA.").	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			---------- 6. Villegas-Amtmann et al. (2015) (Attach. 1), for example, used a bioenergetics model to determine the energy requirements for a two-year reproductive cycle for female gray whales and to predict the consequences of energetic losses under three possible disturbance scenarios. The authors determined that an annual energetic loss of only 4% would prevent a successful gray whale pregnancy. During the birth year, a pregnant gray whales would wean her calf at a lower mass if she experienced a 37% energetic loss. If an adult female gray whale experiences a 30-35% energetic loss, she would lack the energy to become pregnant. Moreover, a 40-42% energetic loss would likely be fatal. 7. For example, although the previous PBR calculation for ENP gray whales used an Rmax value of 6.2, the current precipitous decline in calf production numbers merit a reevaluation of that value. 8. The impact of ship strikes on gray whale may be greater than previously considered. As noted in the SDEIS, "a recent qualitative assessment of the co-occurrence of North Pacific gray whales and vessel traffic found that ship strikes, and related underwater noise may pose a significant risk to gray whales." SDEIS at 39. Recent studies have determined that certain areas present a "high risk" of ship strikes and underwater noise, including the Russian Far East (Kamchatka peninsula and Okhotsk Sea), Bering Sea, Gulf of Alaska, and along the entire west coast of North America. Id. "The study estimated that the number of gray whales killed annually rangewide may be in the tens or perhaps low hundreds, and the risk was greatest during gray whale migration periods when animals are near shore and overlap with coastal shipping routes and fisheries." Id. This is particularly concerning where the 2020 Stock Assessment Report indicated that annual mortality from vessel strikes from 2014-2018 was only 1.8 whales. NMFS	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			must account for the most recent data in human-caused mortality in its analysis of effects of the proposed hunt on gray whales. 9 According to the Washington Department of Fish and Wildlife, "[g]ray whales are especially vulnerable to entanglement because of their use of nearshore coastal waters, where fishing activity is often highest." Chris Sato & Gary J. Wiles, Wash. Dep't of Fish & Wildlife, Periodic Status Review for the Gray Whale 10 (Feb. 2021), available at https://wdfw.wa.gov/sites/default/files/2021-02/gray_whale_psr_final_draft_fwc-ready.pdf. Indeed, "[f]rom 1982 to 2018, gray whales were the most frequently entangled whale species along California, Oregon, and Washington, averaging 6.9 entanglement reports per year, although actual numbers of entanglements are likely much higher than indicated by these reports." Id. 10 According to gray whale kill data provided to the IWC, from 2019 through 2022, Russian indigenous whalers killed an average of 133.33 gray whales each year. See IWC, Aboriginal Subsistence Whaling Catches Since 1985, https://iwc.int/table_aboriginal. 11 In the DEIS, NMFS explains that all alternatives examined encompass training activities, including physical and spiritual training, but fails to specify what the full suite of training activities entail, or what the impacts of those activities on gray whale stocks and their environment will be. DEIS at 2-4, 2-15, 2-22, 3-17, 3-57, 3-175, 3-283. It also repeatedly refers to "practice whale hunt exercises," "whale hunt practice exercises," or "practice exercises," DEIS at 3-163, 3-266, 3-327, 3-332, 3-345, but, again, fails to explain what such practice exercises are or how they may impact gray whales and their environment. Accordingly, NMFS's cursory statements in the DEIS do not substitute for the meaningful analysis in comparative form of all reasonable alternatives that NEPA requires, see 40	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			C.F.R. § 1502.14, particularly where there is an alternative that would meet the purpose and need of the proposed action while better meeting the agency's statutory mandate to protect and conserve marine mammal stocks. While AWI would not support such an alternative, it merits substantive review as required by NEPA.	
			CONCLUSIONAlthough AWI appreciates NMFS's willingness to prepare a supplemental EIS, AWI is extremely disappointed that NMFS is using this opportunity to once again sidestep important issues that matter to AWI, its members, and many American citizens. In doing so, NMFS is failing to follow its legal mandate to protect the marine life in its purview. The proposal to grant the first waiver under the MMPA is highly consequential and requires a rigorous examination of the impacts of the proposal and its alternatives to ensure that any activities authorized comply with the policies and purposes of the MMPA. Unfortunately, the SDEIS falls far short of offering such an analysis. AWI urges NMFS to reconsider the unduly narrow scope of its SDEIS, and to instead analyze all relevant issues that have been raised to the agency at the DEIS stage and in the parallel MMPA process.	Closing comments noted.
502	Romano, Janet	11/03/22	I am submitting this comment letter on the Supplemental Draft Environmental Impact Statement (SDEIS) on Makah whaling. I thank the National Marine Fisheries Service (NMFS) for reopening the comment period to permit additional input on the SDEIS (87 Federal Register 64454, October 25, 2022) although I am disappointed in the abbreviated length of the reopened comment period as they full suite of issues relevant to this decision about whaling by the Makah tribe, particularly in light of the significant decline in both Eastern North Pacific and Pacific Coast Feeding Group gray whales, warrants far more time to permit interested	Introductory comments noted.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			stakeholders to provide informed comments for consideration by NMFS. My comments are limited to four issues.	
			First, considering the findings contained in the two Eguchi et al. (2022) reports made available on 7 October 2022, much of the analysis in the SDEIS, which was based on an old ENP gray whale abundance estimate, is now out-of-date and invalid. Consequently, NMFS cannot publish a final EIS or final SEIS based on old data and, therefore, must invalidate the current SDEIS and prepare a new analysis.	These reports were made available to the public during the comment period and have been incorporated into the FEIS. While they represent new information, they do not change the relative impacts between the alternatives.
			Second, considering the decline in ENP and PCFG gray whales (noting that for PCFG gray whales the most recent abundance estimate is from 2020), it is imperative that a new abundance estimate be published for WNP gray whales. The current WNP gray whale abundance estimate is from 2016 (see Cooke et al. 2018), three years prior to the beginning on the current Unusual Mortality Event (UME). While it is possible that WNP gray whales have not been adversely impacted by the UME that has likely contributed to substantively to the dramatic decline in ENP gray whales, it is just as likely that WNP gray whales have also experienced a decline as a consequence of the direct and indirect impacts of the UME. Furthermore, given the ongoing Russian-provoked war in Ukraine and the impact that war has had on US-Russian relations, it is not clear what studies are ongoing with WNP gray whales, who is doing that research (including the active collection of photographs for photo-identification purposes), and whether actions are being taken to mitigate threats to WNP gray whales in Russian waters. Considering the repeated reference to WNP gray whales in the SDEIS, disclosure of information about the current status of the population, ongoing research on WNP gray whales, and the impact of the war on WNP data collection and sharing, particularly with NMFS, is essential so that interested stakeholders can take into consideration such information when preparing substantive comments.	The status of WNP gray whales is described in Subsection 3.4.3.2, which considers the best available information. See also Appendix C Responses to Frequent and Substantive Comment #18 -Maintenance of a WNP photo-ID catalog in light of changing U.S.-Russia relations.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			While I expect that those engaged in the study of gray whales throughout the ENP migratory corridor will continue to collect data on the status, biology, and ecology of the whales as well as obtaining photographs for photo-identification purposes, without a concurrent effort in Russia particularly to collect photographs of new and newly recruited WNP gray whales, understanding changing WNP to ENP migration rates becomes impossible. This, in turn, prevents an update analysis of the potential "take" of WNP gray whales if the Makah Tribe is allowed to hunt whales.	
			Third, NMFS must revisit whether PCFG gray whales should be designated as a stock under the MMPA. Considering that a decade has passed since NMFS last meaningfully examined this matter, that new Guidelines for Assessing Marine Mammal Stocks have been published during this period, and the wealth of new studies/reports on PCFG gray whales, failing to engage in a reanalysis of this questions suggests that NMFS is purposefully avoiding the matter to avoid jeopardizing its efforts to allow the Makah to resume whaling. ed Makah whale hunt.	See also Appendix C Responses to Frequent and Substantive Comment #5-Stock status of the Pacific Coast Feeding Group (PCFG) of ENP gray whales.
			Finally, NMFS has failed to provide a credible analysis of the current UME which, I suspect, is primarily a result of the impact of climate change and ocean warming on gray whales and their habitat. While the 2015 Draft Environmental Impact Statement included some discussion of the changes occurring in the Arctic as a consequence of climate change and the SDEIS provides some analysis of the marine heatwaves and their impact on gray whales and their habitat, these analyses are superficial. NMFS continues to ignore the drastic alterations upending the ecology of the Arctic oceans and their food webs in favor of a fanciful argument that the decline and increase in gray whale numbers is natural fluctuation associated with ENP gray whales potentially exceeding their biological carrying capacity. This argument is, at best, frivolous poppycock and, at worse, is an intentional effort by NMFS to ignore the fundamental and extensive changes in Arctic ecology to prevent climate change and ocean warming from upending its	See Appendix C Responses to Frequent and Substantive Comment #14-Cumulative effects and the future health of the ENP gray whale population in the face of climate change and other threats. We have incorporated additional information on climate change impacts to the Arctic and gray whale prey in Chapters 3 and considered these in the cumulative impacts in Chapter 5.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			decade's long quest to permit the Makah Tribe to resume whaling. If ENP gray whales had exceeded their biological carrying capacity, which is unlikely, such a sudden and drastic decline of over 10,000 whales in six years would not be expected. Instead, as the population increased you would expect a consistent and gradual, not catastrophic, decline in productivity and survival. When a population experiences a dramatic decline in abundance, it is likely more a product of a problem in the ecosystem and, in this case, a problem with the gray whale's food supply. Similarly, in 1999 and 2000, the years of the last UME, this too may have caused by a change in the Arctic ecosystem affecting gray whale prey abundance, composition, availability, and concentration. In that case, either the ecosystem recovered or, more likely, gray whales were able (ironically thanks to ocean warming) to expand their range to the north, west, and east in the Arctic including the Bering, Beaufort, and Chukchi Seas and found abundant sources or prey allowing the population to not only recover but to exceed previous abundance estimates. The same may occur again in the coming years or, it is also possible, that it won't and that the changes to Arctic ecosystems due to ocean warming will worsen causing either a continued decline in gray whale abundance before a potential recovery (albeit limited), a stabilization of the population at approximately the current abundance or at a lower abundance, or a recovery to some unknown population size which will likely be less than the previous estimated in 2016 (26,980). As NMFS is well aware, given that its own scientists or scientists funded with NMFS research funding are conducting ongoing research in the Arctic, the Arctic marine ecology and food webs are being entirely transformed due to ocean larming. What once was a benthic driven ecosystem offering an abundance of benthic invertebrates of great value,	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			including calorically, to gray whales has become and continues to be transformed into a pelagic driven ecosystem where the massive amounts of carbon that used to fall to the seafloor are now being consumed in the water column by pelagic species expanding their ranges as waters in their traditional habitats warm. Less carbon to the benthos, lower concentration and diversity of benthic species, changes in the composition of benthic species to those with lower lipid – and caloric – content meaning a reduction in the quantity and quality of gray whale benthic prey (primarily amphipods) forcing gray whales to increase time spent foraging and to range further in search of benthic and other prey necessary to meet their significant energy needs. Perhaps, as gray whales expand their Arctic range, they will continue to find pockets or patches of quality prey or, depending on the benthic substrate and other oceanographic properties, perhaps the ability to find accessible and high quality prey will diminish as the whales range further north, east, and west. Furthermore, this "borealization" of the Arctic has a number of tentacles some of which may be perceived to benefit gray whales, at least temporarily, while others harm the species. In addition to the transition from a benthic to pelagic ecosystem, some of the other complexities associated with the changing Arctic ecology that NMFS has, thus far, ignored in its assessment of the environmental impacts of Makah whaling include: reduced sea ice and thinner sea ice impacting the amount of under ice algae available to feed the benthos; alterations in underwater currents affected the distribution of different sized substrates impacting the ecology including the distribution and composition of benthic invertebrates; and changes in the timing of phytoplankton (the fundamental driver of marine food webs) with cascading impacts through the food web thereby forcing gray whales to move to survive.	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			While ocean warming, under such circumstances, could be considered a benefit to gray whales providing vast new habitat (previously with limited accessibility given the ice pack) for them to use and explore, this is actually a detriment to the species. Indeed, given the impact of ocean warming on Arctic marine food webs, gray whales are not expanding there range only because they can (given the increase in open water as sea ice extent declines) but because they have to in search of prey. As they expand their range, the distance that they then must traverse during their southbound migration increases, the time required to make that journey increases, resulting in a larger proportion of pregnant gray whales giving birth during migration in the open ocean instead of in the protected Mexican birthing lagoons. If born in the open ocean, a gray whale calf if subject to myriad threats including predation by killer whales and sharks as well as increased energy expenditure to survive in cold waters, compete against ocean currents, and to complete the migration thereby potentially reducing calf survival rates. Simply put, ocean warming is depleting the quality and quantity of food for ENP gray whales in their traditional summer feeding areas, necessitating an expansion in their range and distribution to find food, increasing the length of their migration, and subjecting gray whale calves born in the open ocean to a variety of threats. Since climate change is human-caused, these impacts are, likewise, human-caused and are in addition to the other human-caused impacts that have always threatened gray whales including ship strikes, bycatch, ocean noise, contaminants, improper land use practices, as well as the large number of activities that may cause the "take" of gray whales in the form of harassment. In the past, NMFS has largely ignored such impacts claiming that, despite such threats, gray whale numbers were increasing suggesting that the individual and cumulative impacts of such threats, including for ocean warming, were not	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			adversely affecting the ENP gray whale population. Given the dramatic decline in ENP gray whales over the past six years, NMFS can't rely on such wishful thinking any longer and must face the reality that ocean warming, particularly in the Arctic, may be so dramatically altering Arctic marine ecology that even gray whales are suffering the consequences. I concede and, indeed, I hope that ENP gray whale numbers begin to rebound but, based on the increasing number of reports and studies demonstrating just how dramatically and rapidly the Arctic is changing, I fear the worst for the Arctic and all Arctic marine life.	
			While, due to time constraints in preparing this supplemental comment letter, I was unable to provide scientific citations to support the claims summarized above, suffice it to say that the number of reports and studies documenting such changes in the Arctic and how such changes are adversely impacting the Arctic marine food web, including gray whales, is immense and growing. Should NMFS, as it must do, prepare a new SDEIS to ensure its analysis is based on up-to-date gray whale abundance estimates, I will provide a more comprehensive examination of such Arctic issues in my comments on that revised SDEIS. As these Arctic ecosystem changes are, presumably, being examined by the team assembled by NMFS to try to determine the causes of the current UME, NMFS either in collaboration with the UME team or independently should organize a workshop with NMFS and other invited experts to comprehensively discuss and evaluate all of the direct, indirect, and cumulative impacts of ocean warming on the Arctic, marine food webs, and the gray whale. This workshop should be a multi-day event with presentations by relevant researchers while allowing the public to provide comment, ask questions, and to be active participants in the discussion. Alternatively, NMFS should request that the National Academy of Science convene an expert committee to examine all aspects of climate change, ocean warming, and impact on Arctic ecology to better inform NMFS as to the potential	These concluding comments are noted.See Appendix C Responses to Frequent and Substantive Comment #14-Cumulative effects and the future health of the ENP gray whale population in the face of climate change and other threats

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			implications, positive or negative, to gray whales from the full suite of impacts of ocean warming on their biology, ecology, behavior, distribution, and migratory movements. Such a workshop or request for an NAS committee review must occur now before NMFS proceeds with any further decision making regarding the requested MMPA waiver and/or NEPA review associated with the proposed Makah whale hunt. Thank you in advance for considering this comment letter.	
503	Hansen, Cindy	11/07/22	Thank you for the opportunity to comment on the Supplemental Draft Environmental Impact Statement on the Makah Tribe Request to Hunt Gray Whales. I appreciate the effort that went into creating a composite alternative to put forth as the preferred alternative. I am very much in support of honoring tribal treaty rights, and I am sympathetic to the cultural losses all tribes have sustained. I do have some concerns about the hunt as currently proposed, summarized below with my suggestions and recommendations. • I am concerned about a hunt being approved when the species is the midst of an Unusual Mortality Event (UME). According to a recent West Coast Marine Mammal Stranding Network brief and technical memorandums by Eguchi et al. from September 2022, the gray whale population has declined 38% since 2016, and the 2022 calf count was the lowest seen since counts began in 1994. The reports mention that several likely factors have been identified, that research is ongoing, and that continued monitoring will determine when the population stabilizes and begins to recover. It is unknown at this time how long the UME will continue, what the final population numbers will be when it's over, and what the overall impacts will be to the Pacific Coast Feeding Group and Western Gray Whale sub-populations. If the UME is related to the impacts of climate change, it is likely only a matter of time until a similar event happens again, perhaps before the population has completely recovered. I	See also Appendix C Responses to Frequent and Substantive Comment #19-Ongoing UME. See also Appendix C Responses to Frequent and Substantive Comment #21-Managing "Sounders" as a separate population.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			recommend that you take all of this into account in your final decision, and if a hunt is ultimately approved, that the ENP Abundance Threshold is set at c) N=18,000, as described in the DEIS. Further, I suggest that if a hunt is approved, that the start time be contingent upon the recovery of the population to pre-UME numbers. • I request that a section be added to the DEIS incorporating information about the "Sounders" or North Puget Sound gray whales, who do not appear to have been included in the document. The Sounders are a unique group of gray whales that, according to Cascadia Research Collective, originally discovered feeding areas in North Puget Sound during a past Unusual Mortality Event and other times of depleted food resources. Some of them have been returning to Puget Sound since 1990, and with another UME underway, new individuals have come in and joined the Sounders. Not only are the Sounders feeding here together but they are also interacting with one another and may even have established long term bonds. These whales are named, known as individuals, and beloved by thousands of people in Puget Sound and beyond. In normal non-UME years, the Sounders would be arriving in Puget Sound beginning in February or March and the last whales would typically leave by the end of May. During the current UME they are spending more time here on average, and in a few cases have even remained during the winter instead of migrating. As they depart Puget Sound to either continue their migration to the Arctic feeding grounds or join the PCFG, their travels may place them in the hunt area during any of the proposed timings. I ask you to please take this population under consideration in your final decision and make sure there are safeguards in place, perhaps through coordination with researchers and sighting networks, to protect them from a hunt. Gray whales are known and loved by people all along their migration	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			route, from Baja to Alaska, and a hunt, no matter how small the take, is going to cause great emotional distress to many, particularly those who have come to know some of these animals as individuals with unique personalities. I ask you to please be considerate of this and take it into account much as possible. I would like to state again that I am supportive of honoring tribal treaty rights, and I realize that what I am asking may create challenges in accomplishing this. If the Makah are amenable to this, I would be fully supportive of negotiations to compensate them for whales not taken due to some of the safeguards I am suggesting. Thank you for your time and consideration. (Revised from comments previously submitted on August 15, 2022)	
504	PCPW	11/07/22	**Supplemental comments to the Supplemental DEIS 2022, re: Makah whaling**Thank you for this opportunity to submit these comments, to be in addition to our previously submitted ones. In the haste to absorb and prepare reactions to three additional papers "dropped" in the final days of the previous comment period, we had no time to re-prepare important sections of comment. Unfortunately, an extra week will not sufficiently remedy the unfairness of this chaotic public comment situation, created, unnecessarily, by NMFS.The release for comment of this SDEIS has been strange . The SDEIS itself seems to have been completed in an odd haste. There are errors unbecoming of a government publication. **And *holding back* the most important information conceivable , *current ENP population and calf production numbers*, in an *"analysis"* of the ongoing UME is inexplicable. NMFS knew that their SDEIS was outdated on its *release date*, June 30. The public did not know this information existed until the last days of the second comment period!**	See also Appendix C Responses to Frequent and Substantive Comment #16-Amount of time allowed to comment on the DEIS.
			One thing that was immediately apparent was that there was a big problem with sections referring to the PCFG. This SDEIS , beginning on page 29, began referring to "Harris et al. in prep". There were at	ENP gray whales are well studied and, thus, there are new scientific papers published frequently. The ENP, including the PCFG , and WNP stock are also

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			least 18 times that population estimates, graphs, tables and charts with that "in prep." credit were used. This was so inappropriate, that we watched daily for the Harris paper to be quickly released to the public. Little did we know that the release of "Harris, et al. in prep" was almost three months away! Far after the first comment deadline of August 15 ! **The PCFG gray whales are at the heart of our concerns about this hunt**. For NMFS to use, so liberally, an "in prep" document that could not be accessed **in whole** by the commenting public, was astounding. By the end of July, the Harris paper had still not been provided. Over two weeks before the August 15 deadline, AWI submitted a request for an extension of the deadline. By the end of July, the Harris paper had still not been provided. Over two weeks before the August 15 deadline, AWI submitted a request for an extension of the deadline. Under a week before the deadline, NMFS agreed to an extension, with a new deadline of October 14. Little did we know, at the end of August, that the release of the Harris PCFG paper was still almost amonth away! On September 27, NMFS posted that missing paper. By then it was just over two weeks from the October 14 deadline. At the end of August we had become aware of another pending paper that NMFS had not mentioned or quoted from. A paper, by NMFS itself, with **new ENP population estimates**. NMFS did not respond to questions about that paper, posed by PCPW on September 27. Ten days later: ***On Oct. 7, one week before the comment period would end,* NMFS reported that AWI had again requested an extension. In that same email from**	assessed though the annual NMFS SAR process. The SDEIS included the best available information at the time of publication. As mentioned, new population and calf numbers were published during the comment period. These papers were made available to the public as soon as possible, and the comment period was reopened. With respect to the Salish Sea and gray whales, see also Appendix C Responses to Frequent and Substantive Comment #21-Managing "Sounders" as a separate population. See also Appendix C Responses to Frequent and Substantive Comment #5-Stock status of the Pacific Coast Feeding Group (PCFG) of ENP gray whales. See also Appendix C Responses to Frequent and Substantive Comment #16-Amount of time allowed to comment on the DEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Laurie Beale , two papers were attached : the EP abundance report, and a gray whale calf production report for 2022. A*nd the announcement that the October 14 deadline for comments would stand. With one week remaining to incorporate all the vital new information.* **An email from Laurie Beale on October 9 relayed the Makah opposition to an extension, and on October 11, Laurie confirmed that there would be no extension of the Oct. 14 deadline.** In the face of what seemed an extremely unreasonable series of decisions by NMFS, we hastily added to, and subtracted from our comments, trying to assimilate so much new information at the last minute. **All the while wondering**: – Why was NMFS in such a hurry to release the SDEIS at the end of June? **Nothing necessitated that timing, and they knew that important new information was being prepared in house.** – Why would they utilize data from the " Harris, in prep." paper, knowing that there would be valid objections , and that the paper was **far from publication**? In fact, it was too far from publication to be released before the initial comment period ended. – Why did NMFS not acknowledge that the Harris paper's PCFG population estimates were already **two years out of date, and that , like the current ENP numbers, the PCFG numbers are very likely worse now** ? – NMFS **saw no problem using "Harris, et al. in prep.", so why did they not** quote from their own "in house" papers "in prep." : **the latest very low ENP population numbers and the latest calf count numbers, lowest ever recorded ?** – Why was there no **actual "analysis" of the UME**, which was the main reason for this "supplemental" DEIS in the first place? – Why does NMFS continue to stand by the **2015 DEIS**, when **nothing in**	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			it has been updated? – Why did NMFS not acknowledge the problems raised by the current tensions with Russia, in relation to access to a current photo ID record of WNP gray whales, and perhaps, the IWC quota share with Russia? **Does NMFS have a plan to reliably access up to date population numbers for the WNP?** **Why didn't NMFS release this SDEIS with timing that would have allowed the inclusion of the Harris paper and the NMFS papers reporting the low, low ENP population numbers and the lowest ever calf count numbers ? NMFS had to know *exactly* what they were eliminating from this SDEIS with their hasty release. Nothing stopped them from awaiting the completion of the three missing reports, thus giving the public the benefit of the full comment period to assess them within the context of an i*nformed* SDEIS .** **Why did NMFS release such an error-plagued, substandard and outdated SDEIS?** **On a first read through, we looked for the report on the unprecedented four year UME, that we expected. Everything known to date. But not even a section title for the UME. We actually thought that it must be coming as a separate document. No. That was it: just a page and a half under the heading "strandings". Those low, low 2022 ENP and 2022 calf numbers, that NMFS had to be well aware were a direct result of the UME, went unmentioned. Old, outdated numbers were used throughout, instead!** **The current population drop in the ENP population was so shocking as to make news around the world, when the paper was released on**	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			October 7. And yet the new numbers did not make it into NMFS 'own report. And the PCFG numbers that they did use ,"(Harris et al. in prep)", are two years out of date. When will NMFS obtain new PCFG numbers? 2023? 2024? The ENP population dropped by another 20+% in the last two years. Did the PCFG numbers also drop in the last two years? **This lag in current PCFG information is the very problem noted by the MMC and by ALJ Jordan in his "dimmer switch" suggestion. A suggestion not taken by NMFS. This situation epitomizes the real problem that the public has in believing that NMFS will recognize a problem, and act, before it is too late. If there is an example of NMFS being that alert and that precautionary in their "management" of a marine species, we'd like to hear about it ! Or is this exactly what NMFS' "adaptive management" looks like? Old information requires no action. The honest facts are changing quickly now. There will need to be annual monitoring, and facts about the PCFG population status must always be ascertained by independent scientists.** **So when will NMFS re-calculate all math formulas, models, and guesses that are the underpinnings and rationale in this proposal to kill ENP and PCFG and WNP gray whales? Where are we now in regard to carrying capacity, maximum net productivity levels, optimal sustainable populations, mixing rates, potential biological removals, and thresholds? Will NMFS and the IWC amend their calculations ? If not, then NMFS is operating in an unreal world of "alternative" facts.** **And will there be updated WNP population numbers in the near future? WNP calf numbers ? Is that information even knowable now?**	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			How can out of date population numbers be used to protect endangered species when famine stalks the seas? NMFS gives us no information. **It is appalling that the commenting public has had to work overtime, through stop and go comment openings, to comment on such a deficient and deceitful piece of work. "Sins of omission" throughout, make this SDEIS impossible to comment on in a rational way.** **For example: We were initially interested to see that there was, finally, a section titled "Salish Sea". We have argued for years that the inland waters and shorelines of the Strait of Juan de Fuca and beyond, are important parts of the PCFG feeding grounds, particularly the Makah U&A gray whales. They are seen in every month of the year at biological hot spots known to the local whales. Some small hot spots are at river mouths and in bays beyond the "study area" that ends at Sekiu. local people and local whales know where to look. These smaller areas dot the south shore, going far to the east, and are important at certain times of the year, for certain whales. No discussion in the "Salish Sea" section.** **Does NMFS doubt that the feeding methods of the gray whales help maintain and enlarge these near shore "gardens"? These are symbiotic relationships. NMFS must be aware that there are studies of the relationships between the gray whales and the sea ducks of the Salish Sea. There was a beautiful Makah song presented at the ALJ Hearing that spoke of the whale and the little duck. Eliminate these whales at any quota level you come up with, and there will be an eventual, cumulative effect on the Salish Sea ecosystem from the loss of these gray whales. Less and less fertilizing, plowing and reseeding of the**	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			benthic flora and fauna by the whales will ripple out to effect the quantity and quality of food available to the fish and others in the water column, and birds on the surface. **There is a lot of life in the near shore and the kelp beds where the gray whales feed (and fertilize). There are many species of young salmon emerging from river mouths and transiting through the near shore looking for food. Most salmon species, and various sea ducks benefiting from the food raised up to the surface by gray whales, are now officially endangered. Does NMFS believe that the gray whales add nothing to their Salish Sea ecosystem? That their loss would not be a loss to the ecosystem? NMFS can admit nothing about how the gray whales enhance the Salish Sea, because they know those gray whales utilizing the Salish Sea will diminish over time. But NMFS also knows that the effects of their diminishment will take years to "see", and that there is no way to allow the Makah hunt without taking out Makah U&A whales.**	
			In 2023 it will be 25 years since 1998, when NMFS opened a whaling season to the Tribe. The agreement (based on a hastily prepared EA) , allowed the Tribe to harvest up to 20 whales every 5 years. (That is not counting struck and lost whales.) And after their kill of a young female gray whale in 1999, the Tribe publicly spoke of needing a larger quota soon.**But even at 20 whales landed every 5 years, between 1998 and 2023 that would mean that at least 100 gray whales could have been killed in the waters of Washington State. NMFS said that 4-5 a year was a sustainable number. Did they do the math? What effects would be apparent by now if the "co-managers" had not been stopped by the 9th Circuit Court? Here's one : *no gray whales to be seen in the Salish Sea.* The "subject"of the Makah's treaty right to whale, whales, is held "in common with all citizens". The 9th Circuit Court's ruling**	See Appendix C Responses to Frequent and Substantive Comment #8-The Treaty of Neah Bay.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			explained that the "in common with all citizens" clause includes and enshrines the right to a 50-50 share for "non consumptive" use by other citizens. Neither party to the "co-tenancy" has the right to destroy the "subject": The "subject" being the only whales the Tribe wants to harvest, and that the other "citizens" can enjoy "non consumptively". The "subject" is the local whales of the PCFG.Is there any doubt that removing 100 gray whales from these waters in the last 20 years would have destroyed the local PCFG population? Amidst the frenzy to kill 5 whales a year, it is likely that the mtDNA testing (that revealed the genetic distinctness of this small group) , never would have been done or been known. And after denying the very existence of "resident whales", NMFS and the Tribe no doubt regret the 9th Circuit's orders to study them, and regret those genetic results that continue to confound hunt planning.	
			An issue raised in the SDEIS that we are very concerned about , is the proposal of a specific quota on female PCFG whales. In the past, there have been hunt plan alternatives that required hunters to only target "known male whales". Long gone is that precautionary concept. NMFS now allows a 50-50 male-female split. Of (16) landed PCFG whales, (8) can be female , every 10 years. NMFS offers no analysis of the potential cumulative effects of this plan (Alt.7) on the Makah U&A gray whales, and the PCFG as a whole.	The action alternatives includes one, Alternative 4, that restricts approaches only to known ENP males.
			A new paper released on October 6, 2022, is a cautionary tale when it comes to "assumptions" about the reproductive "powers" of "reproductive age" females in a stressed and undernourished population of large whales.The paper appears in "Frontiers in Marine Science", and is titled: "*Multi-event modeling of true eproductive states of individual female right whales provides new insight into their decline*", by Joshua Reed, Leslie New, Peter Corkeron , and Robert Harcourt. Their introduction states: *"As population drops, the study of*	The non-lethal impacts on gray whales are evaluated in the analyses (see FEIS Subsection 4.4.3, Evaluation of Alternatives). The Reed et al. paper on the critically endangered North Atlantic right whale (NARW) does not provide new information which would change the conclusions of the analyses. We assume the references in the comments to NPRW are referring to the Reed et al. study on NARWs.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			abundance and population trends of critically endangered North Atlantic right whales has shown results that could well apply to other whale species."We observe the Eastern Pacific gray whales attempting to survive in habitats that are filled with human caused stress , including ship traffic , (and ship strikes) , fishing gear (and entanglements), multi-sourced underwater noise (and trouble hearing prey, predators, and each other). We can also observe the nutritional stresses of climate change, including warming water and diminished prey, likely reflected in the "skinny" whales, the emaciated beached whales, the huge drop in population, and the very few live births of gray whale calves.Many important findings about the effects of sub-lethal stress, poor nutrition, and mortality on the NA right whale females , and the negative effect of that on population growth, could well apply to our gray whales . Some bullet points extracted from this study of female NARWs will follow. Data was collected between 1977 and 2018. **– Reproductive states used in the study were: Up to one year olds were considered "calves" . A female greater than one year, but had no calf yet, was considered a "prebreeder". Once a calf was produced, a female was a "breeder".– Abundance increased until 2010, and was stable until 2013, after which estimated abundance of NARWs decreased.– A decline in females was seen starting in 2014, when there were 185 females.– An annual decline left only 142 females by 2018.– The largest decline was among "breeders" with only 70 alive in 2018.– Female "pre-breeders" plateaued at around 70 between 2011-2018.– Breeding females declined to 51% of the female population by 2018.- "...collapse in fecundity of breeding females and failure of pre-breeders to start breeding are important factors in understanding the current decline in abundance of the NARW**." **"Environmental and anthropogenic stressors have been shown to impede the recovery of right whales by reducing calving rates." (Christiansen et al., 2018, 2020)– "Sub lethal effects of ship strikes,**	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			entanglement, and climate driven shifts in prey availability has shortened lifespans and led to "stunting". Individuals born each year since 1981 becoming progressively smaller...the difference now is as much as a meter." "Stunted growth reduces available energy stores,which means less energy to reproduce, less resilience to future entanglement, and increasing risk of death." St unting results in smaller females with "less capacity to gain sufficient condition to calve than larger females...with fewer females (pre-breeders) entering the breeding population."– There has been a decline in calves since 2012. Reproduction is "energetically expensive". Poor body condition of the mother means undernourishment of the offspring. This leads to reduced energy for growth and delayed sexual maturity for the young, with less energy to invest in reproduction, and increases the odds that "prebreeders" will not transition to breeders."In many large mammals, *females appear to be selected to favor their own survival over reproductive events and are likely to only reproduce when in good condition."* (Gaillard and Yoccoz, 2003) " Female right whales are failing to calve despite being well beyond what was the presumed average age of first parturition." (Krause et al. 2007) In the past decade there have been increased years between calves, with females passing age (9)without calves. "*Shifts in age and intervals at first parturition can influence the number of individual breeders recruited, resulting in shifts in abundance."*Other insights from this study of the female North Atlantic right whales include:-"Adult female mortalities (vessel strikes and entanglement in fishing gear) ... contribute to population decline, with few individuals left to contribute new members to the population."(Corkeron et al., 2018)– Less obvious are factors that produce stress, and thereby reduce abundance : industrialized habitats, sub lethal entanglements and ship strikes, and reduced food availability. These factors can cause mortality and a	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			failure to breed. They can also cause stunting. The authors of this study add: *"The stunted growth of the individuals alive nowcan never be reversed."*– Assuming breeding maturity by age can bias projections by assuming a higher reproduction potential for the species.So what does this have to do with the Eastern Pacific gray whales? *We know that the exact same stressors and mortality causes exist for the ENP, along with a few more.*-ENP gray whales must feed in, and travel through, many industrialized habitats, from the birthing lagoons to the arctic.-ENP gray whales run a gauntlet of crab pots, fishing gear, and nets, all along their migration route, and are victims of lethal and sub lethal encounters.-ENP gray whales are subject to ship and boat strikes everywhere they go , in both lethal and sub lethal encounters.-ENP gray whales are subject to long cycles of "food insecurity" that have now greatly reducedthe ENP population , producing "skinny" whales and emaciated whales, dead and barely living.-ENP gray whales are subjected to brutal annual hunts in Chukotka, Russia, that result in many mortalities , and a great deal of sub lethal stress for those who are chased but not struck.- ENP gray whales are experiencing the lowest birth rates ever recorded. Only a tiny fraction of the ENP "breeders" are carrying calves to term, or becoming pregnant at all.What we do not know:-Are ENP "pre-breeders" becoming breeders at "normal" ages ?-Are ENP breeders reproducing at the "normal" intervals? (It used to be every other year or so.)-What percentage of mothers are in "good" / "poor" body condition? Is NMFS checking for "stunting" amongst different age classes?-What is the "normal" percent of successful mothers in the ENP? What is the current estimated percent?-Will orcas expand their predation in the birthing lagoons?- At what population threshold will NMFS restore the ENP to the Endangered Species List?We learn from the NPRW study that stress itself is an energy drain with physical ramifications.	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			We know that the ENP , WNP , and PCFG whales feeding on the Washington coast will be subjected to high levels of hunter-induced stress , during the 100's of practice "approaches" and the many "practice harpoon throws", as well as during the actual hunting and killing activities.We know from the NPRW study that this stress will have a cumulative and deleterious effect on all age classes and reproductive conditions of the ENP , PCFG and WNP gray whales. The added stress will have the biggest effects on the females, whether they be calves, pre-breeders, or breeders.What is at stake now is the ability of females to find enough to eat to be physically fit enough to either transition from pre-breeders to breeders, or engage in reproductive events at all, at any age. The ability to consume and conserve energy is primary. Energy is what is needed. Energy from enough food to counteract various energy drains from stress.*What the whales do not need is additional , unnecessary , premeditated human caused stress.What is of primary importance now is the protection of the females of all ages, of all whale groups.It is the job of the daughters, mothers, and grandmothers of the ENP, the WNP, and the PCFG tosurvive and thrive, in order to perpetuate the last remaining gray whale groups on earth. They needless stress, not more. Their fertility depends on it. These torturous plans to mercilessly harass andarbitrarily kill from these groups, male and female, is truly outrageous and indefensible.	
			N**MFS / NOAA and the Marine Mammal Commission need to take a hard look at the times we are living in. It is not just this SDEIS that needs to go back to the drawing board. It is also the mind-set that allows NMFS to believe that they can support both the survival of the PCFG and the killing of the PCFG. The MMC needs to do some soul-searching as well. Is this the time, are these the whales, that should receive your blessing for this harsh treatment? It is not the Tribe suffering from "food insecurity". It is the gray whales. Where is any**	See FEIS section 1.5, Public Involvement. See also Appendix C Responses to Frequent and Substantive Comment #16-Amount of time allowed to comment on the DEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			empathy or compassion from the Tribe? It is not their culture at risk of extinction, it is the three, unique cultures of the three gray whale groups. **The origin story of NMFS support for Makah whaling includes making agreements with the Tribe that were based on a misconception by one government lawyer: that the Treaty of Neah Bay took precedence over the MMPA. Everything has flowed from that, and there has never been a "clean slate" look at the matter since. The taint remains on every decision since. The 9th Circuit Court called NMFS' actions "arbitrary, capricious, and outside of the law." We don't think that the Court would look kindly on this latest move by NMFS. An SDEIS purportedly about the UME, but shamelessly lacking in the current UME facts that they had in their possession!** **The comment period chaos has reflected the lack of planning. The plan should have been simple: release an SDEIS that contains all the latest and most pertinent population information, and extrapolate some meaningful analysis about how new facts intersect with their hunt alternatives. And then give the public a reasonable length of time to comment on it.** **That is not what happened. NMFS did not take a sincere, searching, realistic look, utilizing the best available science, at potential hazards to groups of whales or groups of people, posed by the hunt or the UME. Neither did they make a reasoned analysis addressing those concerns.** **The undue haste in which this SDEIS was released can only be interpreted as catering to the Tribe's continual press for speed above**	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			accuracy. Meaningful, honest analysis has been, for whatever reason, sacrificed. **We do consider it a waste of time and energy to make further comment on this SDEIS. It must be "retired" from active duty. It must be re-thought, re-written, re-released for re-comment. Speaking for the Peninsula Citizens for the Protection of Whales, we feel insulted and abused by the stress that has accompanied the release and subsequent chaotic comment periods connected to this bizarre document.** **Nevertheless, thank you for reviewing these comments along with those already submitted. You have our comments to the 2015 DEIS as well. I'm sure that we all wish the gray whales well this migration and calving season, and hope there are signs of better days for them all, and an end to this terrible UME.**	
505	Anderson, Will	11/07/22	PLEASE DISREGARD TWO PREVIOUS SUBMISSIONS: The first was unfinished and short, submitted a minute after midnight, October 14, 2022; the second, more complete but still unfinished, was submitted October 15, 2022. Thank you.Green Vegans/The New Human Ecology submits the following comments on behalf of its supporters in response to the 2022 Supplemental Draft Environmental Impact Statement on the Makah Tribe Request to Hunt Gray Whales.**Introduction**We thank the National Marine Fisheries Service for reopening the comment period that allows us to comment on a very complex SDEIS and ecosystems that are changing in known and unknown ways not ever seen in human history. Green Vegans acknowledges the complexity all parties face in grasping the enormity of what humans have ignited and the fates of species and outcomes in the near and distant years ahead.In our comments, we will include papers that support our assertion that in the current context of a growing climate crisis,	Introductory comments noted. See Appendix C Responses to Frequent and Substantive Comment #9-Ongoing UME.We have incorporated information from Gulland et al. (2022) into Chapters 3 and 5.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			none of us can continue doing business as usual as if the near- and long-term climate future was a new reality for agencies as well. Responding to NEPA requires it, in our opinion. We ask NMFS to consider Re "management" needs in the face of the climate crisis. See. Gulland, F. M., Baker, J. D., Howe, M., LaBrecque, E., Leach, L., Moore, S. E., Reeves, R. R., & Thomas, P. O. (2022). A review of climate change effects on marine mammals in United States waters: Past predictions, observed impacts, current research and conservation imperatives. Climate Change Ecology, 3, 100054. https://doi.org/10.1016/j.ecochg.2022.100054 *More rapid and dynamic implementation of marine mammal management measures is required to address unexpected climate change-induced impacts in a timely fashion. Finally, novel evidence-based conservation interventions should be deployed to complement more traditional marine mammal management and recovery measures.*We ask NMFS to update and weigh the overriding factor of climate change objectively. While modeling sometimes acts as if the future of temperate, subarctic, and arctic ecosystems can be described with reasonable certainty, they cannot do so, and they do not control the variables and gaps in research. It is for those and many other reasons, that the SDEIS must have the absolute latest research and use of the precautionary principle. Waivers, NEPA documents, and the implementation of their Alternatives during the UME should not be approved for long periods of time, if ever. We feel this paper should be a guiding light the next time NMFS feels the need to prematurely publish a NEPA SDEIS and, as importantly, end the practice of proposing the issuance of waivers and the like lasting a decade. It's not enough to say the agency will adjust if new information comes to light when there is the UME and the cascading growth of the climate crisis impacting all species and ecosystems: Re "management" needs in the face of the climate crisis. See, Gulland, F. M., Baker, J. D., Howe, M., LaBrecque, E., Leach, L., Moore, S. E., Reeves, R. R., & Thomas, P. O.	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			(2022). A review of climate change effects on marine mammals in United States waters: Past predictions, observed impacts, current research and conservation imperatives. Climate Change Ecology, 3, 100054. https://doi.org/10.1016/j.ecochg.2022.100054 *More rapid and dynamic implementation of marine mammal management measures is required to address unexpected climate change-induced impacts in a timely fashion. Finally, novel evidence-based conservation interventions should be deployed to complement more traditional marine mammal management and recovery measures.*Though there is a widespread assumption that climate change in the arctic will "benefit" gray whales, these assumptions are dependent on endless variables in arctic ecosystems. Nitrogen added and denitrification in ecosystems, how benthic prey will respond to decreased algal "fallout" with reduced sea ice cover, and gray whales being able to replace benthic sources nutrition with pelagic species successfully. The staggering number of variables behind the assumed benefit are beyond this commenter's ability to decipher. But it took only two marine heatwaves to impact the marine ecosystems that gray whales need severely. From the SDEIS, *The MHW in the northeastern Pacific from 2013 to 2015, referred to as the "Blob," was the largest recorded MHW (Frölicher & Laufkötter 2018). During that event, the West Coast of North America experienced increased marine layer stratification, decreased nutrient fluxes (due to decreases in upwelling), and the deepening of the nutricline (Cavole et al. 2016). Of shore ocean temperatures reached as high as 4 degrees Celsius above the climatological mean (Leising et al. 2015). A Blob-like event developed in the northeastern Pacific Ocean again in the summer and fall of 2019. It was the second largest MHW event in terms of area and was one of the top five largest MHWs recorded within the last 40 years in the region (Northwest Fisheries Science Center 2019).to coincide with sub-arctic seabird colony collapses and the freefall decline of three species of ice seals to indicate how the climate crisis can*	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			upend those assumptions. Then, we have predictions based on assumptions of human success and failure to avoid and unleash the best and worst possible climate change impacts.We see the MMPA and NEPA requiring a far more precautionary approach and decision from NMFS. Green Vegans finds the SDEIS to be incomplete and fatally outdated. Its omissions and publication before critical information is known during the continuing Unusual Mortality Event (UME) ongoing since 2019 undermines and invalidates much of the SDEIS. The ongoing UME is longer than previous events and is set in the context of the worsening climate crisis that humans have never experienced. See, Greenhouse gas concentrations are at their highest levels in 2 million years. (What Is Climate Change? | United Nations).NMFS should have waited until the gray whale counts, calf mortality, and poor body condition of ENP gray whales reversed and recovered. Unlike past UMEs, with the rapidly changing climate drivers affecting ecosystems, there is far less certain whether the "adaptable gray whales" and their distinct population units will revolver as they have in the past. Globally, we and all gray whales, along with all life, have not experienced it; again, it was 2 million years ago. Added to this is NMFS readily publishing the SDEIS while neglecting to declare the Pacific Coast Feeding Group (PCFG) a separate population unit. That neglect and inaction have lasted over a decade. Despite the recently available NMFS technical memoranda and processed reports, the data they rely upon is outdated. The SDEIS doesn't Include updated data critical to the assessment of direct and indirect environmental impacts and/or to provide a credible foundation for the conclusions made for all Alternatives (except "No Action"), including the composite Alternative 7 since they all rely on much of the same outdated data. We will add, for NMFS' consideration, published papers we have found. What remains is that, at least for ENP gray whales, any new DEIS or SDEIS will be insufficient until the UME has passed and gray whale populations have recovered.Green Vegans/The	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			New Human Ecology is limited in human and financial resources and unable to get past the paywalls. We sometimes have to rely on abstracts, and for that, we are doing our best to comment accurately. Green Vegans was unable to tease out whether the SDEIS corrects/updates all essential information in the 2015 DEIS, information that impacts the assumptions, data used, and Alternatives that are key to meeting the requirements of NEPA, MMPA, and ESA, as well as public understanding of the issues. We request that a review of both the 2015 DEIS and the SDEIS is done to recheck and answer this question. Skipping between the two documents was maddening and was a reason we needed more time.**Our conclusion and our request are that NMFS publishes a new DEIS after we all know how much or little gray whales will recover, and the reason(s) for this UME that may go beyond food/prey availability. By that, we mean to replace the entirety of the 2015 DEIS and incorporate updated data that meets the requirements of NEPA, the Marine Mammal Protection Act, and the Endangered Species Act. We all wish the turn-around time won't be hampered by another pandemic. Given what we have, we support only Alternative 1, "No Action." OUR COMMENTS** will be structured as follows: The Glossary; Comments by page; Global issues; Additional subjects we decided to list separately (noise/ship strikes), and our concluding remarks. Please Note 1) We use the actual document page numbers, not that of document readers; and 2) Please assume our comments are meant to apply to the entire document and, by inference, the 2015 DEIS if not addressed in the SDEIS.	
			Glossary Page i - Glossary. The glossary reflects the overall lack of specificity in the SDEIS. We will address some of them in more detail later on, but these need to be added, at a minimum: Approach; Harpoon; Harpoon Attempts; JSI Estimator; Rifle Shots, Sounders, and Hunt Area.	The glossary has been updated to include definitions of approach and unsuccessful harpoon attempts. See FEIS Table 4-1 for the hunt area under each of the action alternativess.
			We contest the definition of "Strike" in detail. Strike - Page 10 - 2.1.6 Limits etc. THIS APPLIES TO ALL PAGES and Alternatives of the	Both the DEIS and SDEIS define strike to be "As defined by the July 2012 Schedule to the

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			SDEIS and 2015 DEIS. "No more than 16 PCFG whales may be struck over the 10-year waiver period...." (SDEIS) This appears to be a critical flaw in both documents for several reasons: The 2015 DEIS stated: *Consistent with the IWC Schedule, the Tribe defines "strike" in their request as "any blow or blows delivered to a whale by a harpoon, rifle, or other weapon which may result in death to a whale, including harpoon blows if the harpoon is embedded in the whale, and rifle shots that hit a whale." The IWC Schedule defines "strike" as meaning "to penetrate with a weapon used for whaling." The WCA implementing regulations define "strike" as "hitting a whale with a harpoon, lance, or explosive device" (50 CFR §230.2). Subsection 916k of the WCA provides that regulations of the IWC are "effective with respect to all persons and vessels subject to the jurisdiction of the United States." For purposes of analyzing the Tribe's request, we therefore interpret the WCA definition of "strike" to be consistent with the IWC Schedule.* The SDEIS defines "strike" - *As defined by the July 2012 Schedule to the [ICRW], strike means to penetrate with a weapon used for whaling.* That appears contrary to the DEIS, above. Does the IWC elsewhere support the Maka definition in writing, where a strike is counted only if it will result in the death of a whale and it has to be "embedded" in a whale? Our enabling domestic WCA describes only hitting a whale, as NMFS concludes. It seems the Makah definition is invalid and must be changed to the WCA definition. The WCA definitions are too open to interpretation when they claim to be equal in impacts on gray whales (GWs). As currently stated, "striking" a whale can result in minor to major wounds. Allocating 18 and 12 strike allowances (physically hitting a whale with a weapon), page 12, (winter/spring and summer fall) can be all misses but could result in serious injuries and invalidates the SDEIS/DEIS category counts and allocations among gray whale groups exposed to the Makah hunt.	International Convention for the Regulation of Whaling, strike means to penetrate with a weapon used for whaling." This is applied consistently throughout the documents to analyze the alternatives If a waiver is granted, the hunt regulations would include a definition of strike.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			We believe it is essential that NMFS include photos, properties and dimensions of all weapons proposed (including darting gun and shoulder gun). If the toggle head has to penetrate 6 inches into the whale to hold, for example, we need to know this to weigh the harm of the resulting injury if it falls out. That is critical to understanding whether it is reasonable not to count it as a strike and the type of would it is likely to create. An example of our concern and reason for believing our request should be agreed to is in part exampled in the 1999 hunt. The type of potential wounds must be considered throughout. To do that, we need exact descriptions with measurements and photos for reviewers to consider. NMFS could help by searching for the latest literature that describes the after effects of tags. See our section on Wounds. For instance, p. 1 - 37 of the DEIS - Whale hunting resumed on May 15, 1999, day three, near Father and Son Rock, Ozette Island, and the Bodeltehs (Gosho 1999), south of the RNA (NMFS 1999) and within 2 miles (3 km) of shore. ...Around 11:00 a.m., the whalers sighted a whale and threw a harpoon, which was assumed to contact the whale because the wooden harpoon holder was split, and the float disappeared underwater for a short time (Gosho 1999; NMFS 1999). The strike did not appear to penetrate or embed in the animal because the harpoon head was intact and clean, the throw was parallel to the animal (rather than perpendicular), and the float resurfaced (Gosho 1999; NMFS 1999). Because the harpoon did not embed in the whale and did not appear to cause serious injury, it did not meet the definition of a strike under the 1998 Gray Whale Management Plan (Gosho 1999; NMFS 1999). Under that plan, a strike counted only if the harpoon embedded in the whale and if it might have resulted in death or serious injury. https://media.fisheries.noaa.gov/dam-migration/2015-makah-deis-508.pdf	Subsection 3.15.3.5, Hunt Methods, of the DEIS and FEIS include a description of the weapons associated with the hunt. We disagree that photographs are needed in order to conduct a sufficient analysis and comparison of the action alternatives. A definition of unsuccessful harpoon attempts was added to the FEIS glossary.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			Elsewhere, it was noted the harpoon shaft split, and the floats were underwater for a bit. Adding more confusion, at least to this reviewer, the SDEIS uses "harpoon attempts' with Table 4-11 serving as the example. This is not defined in the glossaries of the DEIS/SDEIS. Green Vegans assumes this is a weapon launched as attempted but does not contact the whale. This and related terms should be included in the glossary and made more clear to reviewers. Further, the delay in getting the ID of affected whales, including "unsuccessful harpoon attempts," can easily result in exceeding allowances allocated in mixing proportions.	
			Comments by page Page 5 - The last line, "In 2021 the Scientific Committee reviewed the... UME... and concluded it fell within the testing parameters for the SLA (Givens and Weller 2021). As I recall, the Committee used data from 2020. Please address whether the IWC Scientific Committee has been and still is using old data the NMFS should not be used to substantiate the content of the SDEIS. We are offering many documents in our comments in the hope they will be useful and improve the SDEIS.	Subsection 3.4.3.3.3, ENP Abundance and Trends-IWC Implementation Review of ENP Gray Whales, describes the recent Implementation Review process completed by the IWC SC in 2020. The SC reviewed more recent information in 2023, including updated abundance estimates and stranding data, and determined that the SLA and Makah Management Plan are robus to the current UME as well as future mortality events.
			Page 9 - THIS APPLIES TO ALL PAGES of the SDEIS and 2015 DEIS - 2.1.1 Location of the Hunt. Throughout the SDEIS and DEIS, the hunt area is described only generally as occurring in the Makah U&A. As the MUA extends up to 40 miles from the Makah shorelines, we would hope that the proposed hunting area of expected effort was more clear. It seems reasonable to think hunting within two miles of shore will increase and decrease the likelihood of hunting specific populations of PCFG and, perhaps, WNP whales. There was only one reference in the SDEIS to the "proposed hunt area." Further, there is no map we can find of any hunt area. We couldn't find a map for a shore or offshore hunt. Table 2-A, describe the hunt area as an open-ended U&A west of Bonilla-Tatoosh line; no whale may be struck within 200 yards (183 m) of Tatoosh Island	The hunt area under each alternative is described in Table 4-1.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			or White Rock during the month of May. After a long search, we found mention of 3.1 miles in the context of a past hunt and one note of an offshore hunt five miles from shore on page 4-90 of the 2015 DEIS. Please clarify this important element.	
			We would like to know the estimated likelihood of Makah hunt "allocations" spread between ENP, WNP, OR-SVI, and PCFG whales. We have included a map plotted with the actions taken by the Makah in the May 1999 hunt including the kill. I believe the coordinates were from: Gosho, M. E. 1999. (Report of the NMFS observer monitoring the Makah gray whale spring hunt in 1999. Unpublished NMFS-NMML Report). I can no longer find it.	It is unclear what the commenter means by "allocations." Section 4.4 of the FEIS analyzes the impacts of the hunt on the ENP and WNP gray whales stocks as well as the PCFG and gray whales using the OR-SVI or Makah U&A areas.We note the map plotting the 1999 hunt.
			Page 10 & 11 at 2.1.7 AND 4.1.6.6 Low Abundance Thresholds - An approach is defined here " as causing a hunting or training vessel to be within 100 yards of a gray whale." We oppose any approaches and hunting to WNP whales at any time, including the proposed November 1 through June 30 season for all action alternatives. A new paper, SC/68D/CMP/09 Gray whale (Eschrichtius robustus) migratory movements between the western North Pacific and the Mexican breeding grounds: 2022 Update S. Martínez-Aguilar, et al. In part, M*ovements between the WNP and ENP represents 12.6% of gray whales identified of Sakhalin Island and Kamchatka, and the 0.4% of the gray whales identified in the breeding lagoons of Baja California peninsula Mexico. From the 48 gray whales that have migrated between WNP and Mexico, 16 of them have migrate to Mexico at least twice in dif erent years (range from 2 to 5 migrations). ... During the last 23 years, 18 female whales from the Western Pacific have been seen with a calf in the breeding grounds in Mexico, and they represent an important proportion of the reproductive capacity of the WNP population (Table 2).* https://www.sanignaciograywhales.org/wp-content/uploads/2022/05/SC_68D_CMP_09-Mart%C3%ADnez-et-al-	Comments on approaches to WNP gray whale are noted. See also Appendix C Responses to Frequent and Substantive Comment #18-Maintenance of a WNP photo-ID catalog in light of changing U.S.-Russia relations.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			movements-west-east.pdf) However, it appears not all WNP ID photos are directly available to many researchers (pers comm) outside of Russia. Note the catalogs of WNP whales cited in the above study stopped in 2016 (under Methods). That is a problem as it leaves ENP researchers unable to do their own photo comparisons. Given S. Martínez-Aguilar, et al. found two new WNP whales in 2022, and the missing Sakhalin Island and Kamchatka Peninsula photo IDs, the SDEIS appears uninformed as to the number of WNP GWs that may be inadvertently struck or displaced by the proposed Alternatives. Further, we are unable to get the refined location and behavior of three tagged WNP GWs, two of whom are shown in Fig.1 as migrating along or through the MUA. We ask NMFS to get the tagging data as transmitted to determine when, where, how direct or indirect while in the MUA, and how long the two WNPs were there. (Mate Bruce R. et al. 2015 Critically endangered western gray whales migrate to the eastern North PacificBiol. Lett.112015007120150071 https://royalsocietypublishing.org/author/Mate%2C+Bruce+R) That study was done in 2010/11. They were fairly young and were fast swimmers overall. However, we are aware of no data for WNP females with calves who won't be swimming that fast, and perhaps resting or eating along the U.S. coastline, including the MUA. We already know the locations of WNPs off of SVI Weller DW, Klimek A, Bradford AL, Calambokidis J and others (2012) Movements of gray whales between the western and eastern North Pacific. Endang Species Res 18:193-199. https://doi.org/10.3354/esr00447). While the Makah and observers will certainly do their best not to strike	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			WNP calves, it can be difficult to be certain. The SDEIS Glossary defines, C*alf (whale) = As defined by regulations Implementing the Whaling Convention Act, a calf is any whale less than 1-year old or having milk in its stomach.* Yes, skin color and any number of clues may be apparent, but this commenter witnessed on-water several Makah approaches and the difficulty of making that last-minute decision to strike or not from such a low position to the surface of the water in the Hummingbird. Observers may not have time to make determinations with a whale surfacing close to the whaling canoe. Given calves can be 9.2 meters (30 feet) at the end of the first year of life (Selina Agbayani, Sarah M E Fortune, Andrew W Trites, Growth and development of North Pacific gray whales (Eschrichtius robustus), Journal of Mammalogy, Volume 101, Issue 3, 22 May 2020, Pages 742–754, https://doi.org/10.1093/jmammal/gyaa028), we ask NMFS to calculate the expected size of a WNP calf at whatever timeframe in the MUA for which the Makah may be given an Incidental Take Permit. Aside from an unlikely attempt to strike, as stated, estimated calf size at possible time of arrival when making approaches at 100 yards and closing. There is no precaution excessive in protecting the WNPs, and this will apply to ENPs. Green Vegans plotted the approximate distance from the location cited in Weller to Tatoosh Island/Cape Flattery (a clearly known location). One can add a range of distances to locations likely to be impacted in the MUA using Google maps: 1. RUS-U.S. 002 / CRC 0817 M 94-95, 97, 99-01, 04-09 02 May 2004 48°41.41'N 124°58.06'W = Total distance: 22.54 mi (36.28 km) 2. RUS-U.S. 032 / CRC 1045 1 M 97-98, 01-05, 07-10 25 April 2008 48°53.81'N 125°24.54'W = Total distance: 46.18 mi (74.32 km) 3. RUS-U.S. 035 / CRC 0809 2 M 95, 97, 98-07, 09-10 02 May 2004	

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			48°41.41'N 124°58.06'W = Total distance: 21.50 mi (34.61 km) 4. RUS-U.S. 078 / CRC 0825 U 97, 99, 02-04, 06-10 02 May 2004 48°41.41'N 124°58.06'W = Total distance: 22.85 mi (36.78 km) 5. RUS-U.S. 119 / CRC 1040 3 F 03, 10 25 April 2008 48°44.01'N 125°07.70'W = Total distance: 28.96 mi (46.61 km) 6. RUS-U.S. 135 / CRC 1042 4 F 04 25 April 2008 48°44.01'N 125°07.70'W = Total distance: 29.57 mi (47.60 km) However, this dated data examples how little we know about how many WNP GWs transit or otherwise use the MUA. We assume it impacts the fundamental calculations of mixing and the potential to strike one or more WNP gray whales. We believe (Moore and Weller, 2019) is too outdated to use to calculate the odds of striking WNP gray whales. Published in 2019, the data will not reflect the steep decline in ENP gray whale populations. We assume that fewer ENP gray whales as a ratio to known and unknown numbers of WNP gray whales are lower considerably. We do not have the statistical expertise to describe the result; only the possibility of the risk of striking/injuring WNPs is now higher with fewer ENP gray whales present.	
			Page 11 - Identifying the whales affected by the hunt. This applies to all of the SDEIS and 2015 DEIS if NMFS will be relying on this point. NMFS unrealistically states it will somehow document in a timely manner the ID of every whale the Makah impact. That stretches credibility. Insinuating they will have the ID in time to avoid exceeding the allocations for the various groups of whales should be explained. How is NMFS going to keep up when Alternative 7 allows 353 approaches while identifying the whale approached? Green Vegans suggests NMFS contracts with independent researchers, if any, who have proven ability to do this and are skilled at the identification catalogs and using the software to "quickly"	If a waiver is approved, hunt regulations would require that photo-comparisons be made after a whale is encountered or killed. We have assurances from researchers familiar with the WNP and PCFG catalogs that matches to those catalogs could be achieved in a matter of hours or at most a few days. Furthermore, the permitting process allows NMFS to limit the number of strikes, training harpoon throws, and approaches within the permit period should NMFS deem it appropriate, for example if the limits

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			find matches. We do not understand how NMFS intends to apply the SDEIS, tracking impacts, ID whales, and all the rest of the hunt criteria proposed by Alternatives 2 - 7 by documenting the affected whales. The implementation of the SDEIS/Waiver/Incidental Take Permit, if granted, depends on this one function. Please give details and discuss why NMFS creates approach and strike scenarios on a relatively small sample size of Makah hunt activity.	on striking PCFG whales or PCFG females are likely to be met within that permit period.
			Page 34 - "The Makah U&A abundance estimates increased from 18 animals in 1996 to 119 animals in 2020." Good to know, but that and the statements in that paragraph say nothing of the impacts imposed on the MUA and the ongoing UME. If we missed that information, please direct us in your response.	We disagree. The analysis in the SDEIS augments the information in the 2015 DEIS and incorporates Alternative 7. We have compiled the information in the DEIS and SDEIS, and updated as appropriate, within the FEIS making it more accessible to the reader. The impacts to WNP whales are evaluated under each of the action alternatives. The SDEIS and FEIS consider the need for an incidental take authorization. For example, section 2.3.7.1.1 of the FEIS, which is on Alternative 7notes that "in order to receive a permit for a winter/spring hunt, the Tribe must also obtain an Incidental Take Authorization (ITA) under the MMPA for WNP whales." If a waiver is granted and an ITA is needed, there would be additional opportunities for public comment.
			Page 60 at 4.1.6 Alternative - Of the three thresholds proposed, we are already below 7c, and with near certainty, the UME will soon/has already triggered 7b. [Eguchi, Tomoharu; Lang, Aimée R.; Weller, David W.Title (2022) Eastern North Pacific gray whale calf production 1994-2022] using older data that includes a crashing calf count of 216.7. 7a is a nonstarter as	The recommendation that the threshold of 11,000 is a nonstarter is relative to the implementing regulations if a waiver is granted. It does not inform the analysis of the alternatives which, for Alternative 7 include a

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			a reduction to 11,000 gray whales will likely result in petitions to re-list under the ESA. For the purposes of the SDEIS, presumably, the three thresholds already stop the Makah hunt unless we are missing something.	range of low abundance thresholds and a subalternative with no abundance threshold.
			Page 63 - Potential number killed. The number killed is stated to be dependent on abundance estimates of the PCFG and ENP whales and the best available estimates for WMPs. There should be a requirement that those abundance estimates use data aged less than one calendar year during the UME.	The comment on the abundance estimate and the recommendation, if a waiver is granted, for a requirement in the regulations to specify the "age" of the abundance data are noted. The comments do not provide any information to inform the analysis of alternatives under NEPA.
			Page 64 - Potential Number of unsuccessful harpoon attempts and approaches. As an environmental impact statement, why is the allowed number of approaches and “harpoon attempts” calculated on how the Makah have hunted in the past instead of its impact on the whales and ecosystems frequented by the three groups cited? NMFS must recalculate approaches and not propose a maximum of 353/142 of them (Page 65) based on Makah practicing and attempting kills. As NOAA/NMFS is aware – since they concede to this point in the SDEIS, the behavior of gray whales during the migratory season and during the summer/fall period can be very different with gray whales during the winter season “making them more vulnerable to a successful strike.” SDEIS at 64. Despite admitting that whales encountered during the summer/fall season may be more susceptible to lethal strikes, inexplicably, NOAA/NMFS continues to rely on the 6:1 ratio for its impact assessment versus developing an estimate that may be more applicable to a hunt during the summer/fall season. At a minimum, please review seasonal differences to ensure that the behavior of gray whales during the different seasons is sufficiently considered and allowed stikes and approaches to be re-evaluated.	The NEPA analysis considers a range of alternatives which have different potential numbers of unsuccessful harpoon attempts and approaches. The impacts of these alternatives on the whales and ecosystems described are assessed and compared. As described in the section cited, we acknowledge that the ratio could be lower during summer/fall hunts given likely differences in behaviors. Nevertheless, we use the observed ratio of 6:1 fas that represents the best information available based on experience from the 1999 and 2000 hunts. We are not aware of, nor has the commenter provided, any data to inform a different ratio.
			Page 65 - Including darting guns and shoulder guns (grenades) into the DEIS/SDEIS seems arbitrary and capricious. They add other considerations that would need further clarification and review than	Section 3.4.3.1.1-Review of Hunting Methods in the DEIS and FEIS describes the basis for including alternative hunting methods such as grenades. While

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			offered. Safety is different, training, noise, cost, increases in strikes lost that create larger wounds, damaged meat and other parts the Makah wish to have, and the inappropriateness of scale. These are not bowhead whales. The SDEIS inadequately addresses these concerns. Please delete darting guns and shoulder guns (grenades) unless the Makah have made that intention known so it can be stated for public understanding of the impacts. We address wounds in this context elsewhere.	it is likely the Makah would use a rifle in any hunt, we have analyzed these alternative weapons for the reasons described.
			Page 87 - Second sentence. As we commented before on approaches, NMFS is c*alculating as many as 48 rifle shots ...annually* based on past Makah hunting efforts. We believe the SDEIS should first consider environmental impacts and safety and then do a recalculation of rifle shot allowances. Shooting at whales on the water is an uncommon skill beset with the unexpected. Please recalculate a reasonable, allowable number of shots except in an emergency for safety based on objective standards for dispatching whales. We do not know where you would find that, except don't use the whaling defacto use of smaller weapons on WNP gray whales.	Subsection 4.1.5.5, Potential Number of Shots Fired or Grenade Explosions, in the DEIS provides the basis for the estimates of potential shorts fired or grenade explosions. We believe using past hunt data is the best available information.
			Page 96 - Natural mortality. "Strandings. As of June 3, 2022, 578 gray whales. The ACS/LA Gray Whale Census of 2021-22 runs a bit longer, so it is no surprise that their number of strandings is higher at 606, with the difference coming from 2022. NMFS source of 2022 strandings, 76, is Eguchi et al. (October 2022). Green Vegans does not know if or how much this impacts the statistical assumptions in the DEIS/SDEIS, but we ask it to be reviewed.	The stranding data has been updated in the FEIS and considered in the impact assessment.
			Page 96 - Last paragraph. ...only two UME whales have been identified to date as PCFG animals. Our response is we request this be checked with the most recent papers available for body condition data on PCFGs. We believe this study that establishes a baseline for PCFGs is at https://esajournals.onlinelibrary.wiley.com/doi/full/10.1002/ecs2.3094, which is not included in the SDEIS.	We have confirmed with researchers working on the UME that this statement is accurate. The study cited assessed the body condition of ENP gray whales on foraging ground from 2016–2018.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			GLOBAL COMMENTS - other threats and considerations inadequately addressed in the rushed publishing of the SDEIS- The literature cited in the 2015 DEIS are, of course, often outdated, as is the SDEIS. NEPA and the MMPA require the best information available in NMFS' decision-making. The Pandemic contributed to that delay and dated data, perhaps. For whatever reason(s), knowing the long-standing annual counts of migrating gray whales is critical. The ACS/LA GRAY WHALE CENSUS AND BEHAVIOR PROJECT: 2021-2022 (www.acs-la.org) runs longer and includes both northbound and southbound migrating gray whales, while NMFS conducts northbound counts over a shorter timeframe.	We have considered the literature included in the letter as described below and incorporated it into the FEIS, as appropriate.
			- Both efforts reflect the ongoing UME. We ask NMFS to include all three counts as soon as they are available and withdraw the NEPA DEIS/SDEIS effort until the UME is resolved, as there seems to be no way forward until the UME has ended and gray whales have recovered. Unfortunately, both the DEIS and SDEIS give too little weight to the 2019-to-present UME is longer than the previous two UMEs cited. Both documents fail to consider this UME will easily be unique as it is likely to be driven in large part by the impacts of global warming, and all the geophysical changes, for better or worse in different areas, is different this time. The ongoing climatic conditions are extreme and have a destructive inertia that will last for millennia (https://www.ipcc.ch/report/ar6/wg2/).	See Appendix C Responses to Frequent and Substantive Comments #19-Ongoing UME. See also Section 3.4, Affected Environment-Gray Whales, and Section 4.4, Environmental Consequences-Gray Whales, of the FEIS.
			- New feeding opportunities may be created if gray whale prey can adapt quickly enough to be abundant and timely for gray whale use. The heretofore benthic prey was the mainstay for gray whales. Many questions remain about the caloric content of available pelagic and benthic prey species as ecosystems undergo rapid change. An example is Kędra and Grebmeier, 2020. Ecology of Arctic Shelf and Deep Ocean Benthos, https://onlinelibrary.wiley.com/doi/abs/10.1002/9781118846582.ch12.The	We have updated the FEIS to include recent literature (e.g. Stewart et al. 2023) on ecosystem impacts and climate change.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			monumental changes are best guesses and models cannot reliably the outcome of factors like human societal stability.	
			- A paper on prey and whale distribution not in the SDEIS is Moore, S. E., Clarke, J. T., Okkonen, S. R., Grebmeier, J. M., Berchok, C. L., & Stafford, K. M. (2022). Changes in gray whale phenology and distribution related to prey variability and ocean biophysics in the northern Bering and eastern Chukchi seas. PLOS ONE, 17(4), e0265934. https://doi.org/10.1371/journal.pone.0265934 https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0265934	Moore et al. (2022) has been considered in the FEIS.
			- On a more local scale important to the PCGG is Port Orford OR prey availability and GW foraging. Data 2018 - 2020 See whale quality v quantity. Also, Gray whale foraging ecology in the quality and quantity of prey available to PCFG gray whales may be associated with ongoing declines in kelp forests along the US west coast triggered by a marine heatwave that occurred from 2013−2015 (Rogers-Bennett & Catton 2019, Starko et al. 2019). While the effects of kelp declines on zooplankton, particularly mysids, are unknown, reduced kelp habitat frequently causes altered community species composition (Sanford et al. 2019) and lasting ecological impacts (Rogers- Bennett & Catton 2019). Indeed, we noted a sharp decline in kelp abundance across years in the study area, particularly in the TC site (L. Torres pers. obs.), which may influence the zooplankton community given the significant relationship we documented between zooplankton abundance and kelp habitats. https://www.int-res.com/articles/meps_oa/m695p189.pdf	Sanford et al. (2019) and Hildebrand et al. (2022) have been considered in the FEIS. The other papers cited do not provie additional information that would inform the impacts analysis. The impacts of marine heatwaves, including on kelp forests, are discussed in Subsection 3.3.3.2.1, Physical Features and Processes- Dynamic Proccesses and Variability, of the FEIS.
			- There are UMEs for other species in the Arctic as well, including three species of ice seals whose benthic food sources are in decline (https://www.fisheries.noaa.gov/alaska/marine-life-istress/2018-2022-ice-seal-unusual-mortality-event-alaska) indicating the challenges for many species.	We agree that there are challenges for many species, and those stressors relevant to the proposed action are considered in section 5 of the FEIS.

Document ID NOAA-NMFS-2012-0104-	Name	Date Received	Comment	Response
			- Emphasizing earlier points with the same papers, given the ongoing UME, NMFS may be minimizing the impacts of the Makah hunt that can be tolerated because the newest research is not included.	See responses above.
			-Green Vegans believes the usefulness of the SDEIS requires more discussion on the forces that drive site fidelity so often cited in papers. They include: [Site fidelity and social indicators along Vancouver Island]: Burnham, R.E.; Duffus, D.A. A Multi-Dimensional Examination of Foraging Habitat Use by Gray Whales Using Long Time-Series and Acoustics Data. Animals 2022, 12, 2735. https://doi.org/10.3390/ani12202735 https://www.mdpi.com/2076-2615/12/20/2735Filatova, O.A., Fedutin, I.D., Pridorozhnaya, T.P. et al. Bottom-feeding gray whales Eschrichtius robustus demonstrate a finer scale of site fidelity than pelagic-feeding humpback whales Megaptera novaeangliae on an Arctic feeding ground. Polar Biol 45, 1013–1021 (2022). https://doi.org/10.1007/s00300-022-03048-x	Burnham et al. (2022) and Filatova (2022) have been considered in the FEIS.
			- Another subject we feel essential to all ENPs is the contribution of resiliency distinct populations and their feeding areas. Examples: Torres, L. G., Bird, C. N., Christiansen, F., Bejder, L., Lemos, L., Urban R, J., Swartz, S., Willoughby, A., Hewitt, J., & Bierlich, K. (2021). Range-Wide Comparison of Gray Whale Body Condition Reveals Contrasting Sub-Population Health Characteristics and Vulnerability to Environmental Change. Frontiers in Marine Science. https://doi.org/10.3389/fmars.2022.867258 Blanchard, A. L., Demchenko, N. L., Aerts, L. A. M., Yazvenko, S. B., Ivin, V. V., & Shcherbakov, I. (2022b). Benthic studies adjacent to Sakhalin Island, Russia, 2015b I: benthic biomass and community structure in the nearshore gray whale feeding area.
